The Induction Coil.—Coincidently with the introduction of the variable contact (microphone) transmitter came the application of the induction coil to the telephone. Fig. 23 shows the original telephone circuit and two important steps in the evolution of telephony whereby it became possible to talk over greater distances than formerly. In the simple magneto telephone circuit $A$, the amount of electrical energy transmitted depended on the ability of the telephone, when spoken into, to generate a current independent of any outside source. This current was limited in strength to the small amount obtainable from the vibration of the diaphragm by the voice. $B$ in Fig. 23 shows a circuit in which the variable contact transmitters, the receivers, the line and the source of energy (battery) were connected together in series. With this arrangement better results were obtained, the extent of improvement depending on the voltage of the battery, the conductivity of the line and the current changing capabilities of the transmitter. In this circuit the transmitter acted as a valve to vary the energy furnished by the battery. $C$ in Fig. 23 shows the use of the induction coil, the latter consisting of a bundle of iron wires surrounded by two separate wire windings. Each transmitter is placed in series with a battery and the primary winding of an induction coil consisting of a few turns of large wire. The secondary winding of the induction coil, consisting of many turns of relatively fine wire, is connected in series with the line and the receivers. Placing the transmitter in a local circuit, independent of the line circuit, permitted the use of a low voltage battery and allowed the variation in resistance produced by the transmitter to be large in comparison with the total resistance of the primary circuit. The induction coil operates as a transformer. The relatively large variable current at low voltage in the primary circuit is transformed into a small current at high voltage in the secondary circuit by reason of large ratio of the number of turns in the secondary winding to those in the primary winding. The secondary current traverses the line with less loss than would be the case if current were of lower voltage but larger.

Signalling Systems.—When the box telephone was first employed, the custom was to tap on the diaphragm with a pencil as a method of calling the party at the other end of the line. Later this was superseded by a hand-operated hammer mechanism which gave a vigorous blow on the diaphragm that was transmitted telephonically to the station at the other end of the line (Fig. 11). Tap bells were also employed for signalling as were ordinary electric vibrating bells and telegraph sounders. The need for a reliable and efficient method of signalling was realized at an early date and Watson developed a ringer and magneto-generator to meet this need. The ringer (Fig. 24) consisted of an electro-magnet having a central pivoted polarized armature carrying the wire.
which played between two gongs. Polarizing the armature made it responsive to the reversals in polarity of the magnet when alternating current passed through the coils of the latter. To furnish the alternating current, a small electric generator (Fig. 25) was provided, consisting of a powerful permanent magnet carrying an armature capable of being rotated by a wheel which the calling party turned by means of a crank. Figs. 26 and 27, in diagrammatic form, the principles of the latest types of generator and ringer.

**Automatic Switchhook.** It was early apparent that some means should be provided for switching, to and from the line, the signalling and talking circuits at the substation whenever it was desired to do so. At first, hand-operated switches were used for this purpose but it was soon found desirable to make the switching operation automatic, as users would frequently leave the hand-operated switch in the wrong position. To attain this end, a lever switch was invented by H. L. Roosevelt. The switch was operated by the weight of the receiver. Fig. 28 shows an early set arranged to accomplish the desired purpose. The hook-switch, in its downward position, left the circuit free for the incoming signal; in its upward position, which it assumed when the receiver was removed from it, the necessary contacts for talking were closed. Figs. 29 and 30 illustrate the switchhook arrangement for the present telephone. Figs. 31 and 32 show the circuits controlled by the switchhook for a standard magneto and common-battery substation circuit respectively.

**Series and Bridging Bells.** In the early days, after the development of the magneto-bell, it was the practice, on party lines, to connect the sets in series, as shown in Fig. 33. To enable the ringer to operate effectively it was necessary to provide it with a large number of turns of wire. As a result these ringers possessed considerable impedance, i.e., they offered substantial obstruction to the telephone current, seriously affecting the service between any two talking stations. The more ringers in the circuit, the poorer was the talk. To improve this condition, in 1889, John J. Carty, who at that time was known as one of the chief technical experts, and who has since become the rec-
recognized engineering leader in telephony, invented the bridging bell. In this arrangement (Fig. 34) the bell, or "ringer," has a high impedance winding which, while responsive to the relatively low frequency ringing current, does not permit the talking current to pass over the ringer circuit, but does allow it to pass over the line from one station to another. It was this invention which made possible the successful use of party lines.

Switchboards.—If its use had been restricted to isolated lines only, the telephone would undoubtedly have remained scarcely more than an interesting scientific curiosity. With the development of the instruments themselves, the necessity for connecting one telephone station with another, by means of some switching device, at once became apparent.

The first interconnection of telephone lines by means of a switchboard took place at Boston in 1877. A few burglar-alarm lines were equipped at the station ends with box telephones. At the burglar-alarm office, each line was connected to a small metal block. These blocks were so arranged, in relation to other metal blocks placed closely beside them, that metal plugs could be employed to connect the blocks together in various ways, thus permitting the lines to be interconnected as desired (Fig. 35).

The first commercial switchboard was provided with an electromagnetic annunciator shutter or index of which moved, when a subscriber operated the magneto-generator at the station, thus attracting the operator's attention to the fact that a connection was desired. This shutter operated each subscriber's line was also connected at

switchboard to a device known as a "spring-jack." The insertion of one plug of a connecting cord into the spring-jack associated with the line of the calling subscriber and the plug at the other end of the same cord into the jack of the line of the called subscriber, placed these subscribers in connection so that they could talk with each other. The cords were provided with listening and ringing keys. The former enabled the operator to communicate with the calling subscriber to ascertain the line with which connection was desired. The latter permitted the operator to send alternating current over the called line for the purpose of ringing the called subscriber's bell. An electromagnetic disconnect annunciator in each cord circuit enabled either subscriber, by operating his magneto-generator, to signal to the operator that the conversation had ended.

![Fig. 39.—Simplified Circuit Diagram of Series Multiple Switchboard. (Operator's telephone shown connected for "busy test").](image)

Switchboards of this general type were used until the number of lines terminating in a telephone central office had grown so large as to exceed the ability of one operator to complete all of the connections. This situation was met by placing two or more switchboards side by side, the operators completing the connections by reaching across, with their flexible cords, from one board to another. As the number of sections of switchboard placed side by side increased still further, the distance to which an operator could reach was exceeded. The next step was to join the sections of switchboard by metal strips or wires. An operator could then connect a calling subscriber with a certain strip and request another operator, more conveniently situated, to connect the called subscriber to the same strip. These strips constituted the first use of the so-called "trunk line" between switchboards. The practice led to much confusion, due to the operators calling out the desired numbers, and resulted in the development of means enabling the operators to communicate along the switchboard by telephoning one another. This type of switchboard was known as the "transfer" board. As the number of lines grew, it gave less satisfactory service and it was seen that, unless something better was developed, the switchboard would be a serious limitation on the growth of the business. The solution was found by multiplying the points of access to each subscriber's line so that a means of access (spring-jack) to each subscriber's line in the office appeared in the face of the switchboard within reach of every operator, thus obviating the necessity for trunking calls between operators in the same office. The switchboard in which this "multiple" principle was first used was known as the "series multiple" board. The invention of the multiple was made by L. B. Firman. A simplified diagram of the wiring of this board is shown in Fig. 39, which also illustrates the construction of the spring-jack. In this ar-
was required to touch the tip of the connecting plug against the ring of the jack with which connection was desired before completely inserting the plug into the jack. If the desired line was already in use, the potential on the ring of its jack would cause the operator to hear a "click" in her head telephone, thus indicating that the line was already in use through a connection established at some other part of the switchboard. These two very important principles—the multiple and the busy test—have persisted, in one form or another, in every large switchboard up to the present time. A serious objection to the series type of board was that dirt or dust, accidentally lodging in the spring jack contacts, would introduce high resistance into the line, or even cause the circuit to become open, thus interfering with or quite preventing conversation over the line. Another objection to the series board was that the circuit in the switchboard was unbalanced. To overcome these defects Scribner, applying Carly's bridging principle to switchboards, devised the "branch terminal" multiple board. (Fig. 40). With this arrangement of circuits, two wire system, the switchboard had to be adapted throughout to the new plan of working. This meant a wholesale displacement of existing grounded line switchboards by boards of the new metallic circuit type.

For a long time after multiple switchboards came into use, batteries were required at each telephone station to furnish the current for actuating the transmitter, and magneto-generators, operated by turning a crank, were employed for signaling the central office whenever a connection was desired. The generator was also used for signaling "disconnect," and was not wholly satisfactory for this purpose, as subscribers frequently neglected to give the disconnect signal, making it necessary for operators to "listen in" on connections and ask "Are you through?" The invention and development of the common battery system did away with the batteries and magneto-generators at the telephone stations. With this system the only battery required was a large centralized or common storage battery at the central office. This system, furthermore, did away with all mechanical line and disconnect signals in the switchboard, by enabling tiny electric lamps, governed by relays, to be substituted for them.

This was one of the most important improvements ever made in telephone switchboards. The subscriber, connected with a common battery board, calls the central office by merely removing his receiver from the hook, the motion of the latter causing a lamp associated with his line to light before the operator. Completion of the conversation is indicated to the operator by suitable lamp signals in the cord circuit, when the receiver is replaced upon its hook. The circuits of common battery switchboards are of two types—the impedance coil type and the repeating coil type. Fig. 41 shows a typical circuit diagram of the latter type, which is the more generally employed. Fig. 42-A shows the front view of a modern common-battery switchboard. The operators sit on

n front of the switchboard. Fig. 42-B is a detail of a single position. Where the operator is the unit of service, the subscriber's line is provided, at the central

TELEPHONE

the operator at the distant office (known as the "B" operator). The number of the desired line is then transmitted over the call circuit to the "B" operator, who, by visual inspection, selects an idle trunk line and transmits back its number to the "A" operator, who at once connects the calling party with that trunk line, the "B" operator meanwhile establishing connection between the other end of the same trunk line and the line of the called party. The call circuits are used for no other purpose than communication between operators.

Trunk circuits have been designed, and are in general use, which allow the "A" operator to supervise a connection completed in a distant office as readily as would be the case with a connection completed in her own office. The same is true of machine ringing circuits whereby the bell of the called subscriber at the distant office begins to ring automatically as soon as the trunk line plug is inserted in the jack of his line without the "B" operator being required to operate a ringing key.

Toll Boards.—The term "toll connection" is applied to connections between subscribers so far removed telephonically from each other that a special toll charge is made for the connection. On account of the fact that the toll lines between one place and another have to be grouped together for efficient operation and that each toll message has to be carefully timed and a ticket record made of the call, connections generally require special switchboard circuits and apparatus at the central office and the service of special operators. In the case of the smaller central offices the toll switchboard is sometimes combined with a portion of the local switchboard. In larger places, to enable adequate toll service to be given, separate large and complicated toll switchboards are ordinarily required. These toll switchboards are usually centralized at one point in the city and are connected by special trunk lines with the local switchboards in the several central offices of the city. In cities of the largest size more than one toll switchboard centre may be required.

Party Lines.—Serving more than one telephone user by means of a single line (party line) enables those having but little use for the telephone to obtain service on a basis which otherwise would be impracticable. The successful operation of the party line depends upon the Carly bridging bell principle already described. The extensive use of party lines to serve farmer's or rural stations, by destroying the isolation of the farmer, has produced a wonderful improvement in his economic and social life by placing him in constant touch with markets and sources of supply, and with the weather bureau, and has provided for his family a means of communication available not only for social purposes, but also ready at all times for summoning help in the event of sickness or danger. On party lines between two stations, and on some equipped with four stations, means have been devised whereby the bell at a given party line station may be rung, the others meanwhile remaining silent.

Private Branch Exchanges.—The important adjuncts to the telephone central office are the private branch exchanges. These consist of switchboards, generally of small size, located in such places as hotels, apartment buildings or large business houses and having connected to
TELEPHONE

them all the subscriber's lines in such establishments. Private branch exchanges are also connected with the nearest telephone central office by a sufficient number of trunk lines to handle the traffic arising from and flowing to them. Calls originating within the establishment where the private branch exchange is located, for parties within the same establishment, are completed by the private branch exchange operator without passing through the telephone central office. The introduction of the common battery system greatly facilitated the operation of private branch exchanges and enabled the necessary talking current to be supplied over trunk lines from the central office. Fig. 43 shows a typical private branch exchange of moderate size. Some of the largest private branch exchange switchboards are comparable in size to central office switchboards serving large communities.

Automatic Systems.—Throughout the development of the manually operated switchboard, the tendency was continually toward increasing the use of automatic labor-saving machinery. In the most modern forms of manually operated boards a complete analysis of the switchboard shows that a large proportion of them are performed automatically. The term "automatic" or "machine switching," is, however, applied to systems in which the number of operators required at the central office is reduced to a relatively small number, the switching functions otherwise performed by operators being, to a greater or less extent, performed by electro-mechanical appliances. During recent years there has been extensive development of machine switching systems. The apparatus is highly complex and ingeniously devised.

In what is known as the full automatic system, the subscriber puts the automatic mechanism at the central office in motion and directs it so as to obtain the desired connection by suitably operating a movable numerical dial attached to the base of his substation set. Fig. 44 shows a typical set with the dial. The face of the dial is shown in Fig. 44-A.

Briefly the operation is as follows: Assume connections line 753. The calling subscriber places his finger-tip in the hole of the dial, on his set, over figure 7 and turns the movable part of the dial in the direction of the hands of a clock, until his finger reaches the crescent-shaped stop. He then releases the dial which is automatically moved back, in the opposite direction, by a spring. This motion, by making and breaking a current on the line, seven times, sets in operation in the central office an electro-mechanical device known as a selector, whose function it is to select some idle trunk line in the 700 group. These trunk lines terminate in other selectors of a similar type. By repeating the dialling operation, this time for figure 3, connection is established with the fifty in the 700 group. By dialling once again, this time for figure 3, the line of the calling subscriber is placed in connection with line 753. The selectors are made in a great variety of forms. In one form they consist of a series of drum and subscriber line-sets attached in pairs, Corel another, with selector rods moving vertically in front of these pairs. In another form the terminals are arranged in layers around an arc, contact being established by a cent capable of being raised to the proper then rotated.

In both forms suitable means are pro for automatically ringing the called sube bell and for indicating to the calling party the called line is already in use.

In the semi-automatic system the removes his telephone from the ho mits the desired number by telephine central office operator. The operators manual. Thereafter, however, the operator's automatic machinery at the central o complete the connection, instead of 01 the switching operations manually.

In modern telephone engineering the peculiar factors, surrounding each case a new central office equipment is to be mended, are carefully studied in order to determine whether or not it is necessary to provide a manual connection, the automatic system is, in view of all the cir cumstances, the best. The names of Kell mer, McQuarrie and Strower are among those who have contributed to a switchboard development.

Telephone Lines. Early Lines Telegraph Lines.—The first telephone a copy of the old telegraph line. It was a single iron wire using the great a return circuit. In addition to elec turbances, coming from no one km picked up by these early grounded m frequently causing noises in the too loud as to destroy conversation, ne covered that iron wire was not as a ductor for the telephone current as the telegraph current. The talking therefore, was limited by the impo ing power of the conductor. It was a l that, if the telephone system was to something better than iron wire would required. Various metals and alloys were and it was found that copper best all electrical requirements. But copper wire according to the then state of the art was too weak in mechanical strength. A little conceived the idea that if a wire could be drawn cold through a series the resulting wire's had a tensile strength much greater than am. annealed wire which was the usual wire then known to the trade. He a series of experiments which re production of commercial hard drawn wire having substantially all the electrical characteristics of soft coupled with a tensile strength of that of the soft wire, and fully strength of ordinary iron wire of size.

An experimental line, the first to telephone line in the world, was co 1884 between New York and Boswo among two hard drawn copper wires 01 in diameter. The satisfactory conduction over this line demonstrated mercial feasibility of the new type of, the following year, 1885, another line between New York and Phila equipped with 24 hard drawn copper wires various sizes. Careful experiments on this line established the proper qualitats of the new product and the efficienc of different sizes and vario
ing this development, the use of hard copper wire became the standard for telephone lines, first in the Bell Telephone, and later, the world over, greatly extending the range of transmission. In 1892, New York was placed in telephonic communication with Chicago. The wire employed for this purpose was coated with chrysacron, which was an insulation that could withstand the subzero weather conditions of the Midwest. The wire, which was initially strung on existing iron poles, evolved to being strung on new poles made of concrete and steel. This allowed for a better electrical and mechanical performance, reducing the likelihood of wire breakage due to snow and ice accumulation.

By 1870, the telephone system had expanded significantly, with numerous exchanges and lines being added. The need for a better system to handle the growing number of calls led to the development of the multiple circuit system. This allowed for the simultaneous transmission of multiple conversations. The system was made possible by the use of techniques such as frequency separation and the introduction of the repeater, which allowed for the amplification of the electrical signals over long distances.

The telephone grounded circuit presented a significant challenge. When the system was switched to a grounded circuit, the wires could be directly connected to the ground, which reduced the electrical noise. However, this also led to the ground becoming a significant source of electrical noise, which could interfere with the calls. To overcome this, the principle of the metallic circuit was introduced. The metallic circuit was a circuit that used all metal conductors, which were less susceptible to electrical noise. The principle of the metallic circuit was later refined into the balanced metallic circuit, which further reduced the electrical noise and improved the signal-to-noise ratio. The balanced metallic circuit used a pair of wires, one for each direction of the signal, which helped in canceling out the electrical noise. The result was a more reliable and higher-quality telephone service.

By 1893, the number of telephones in the United States had reached such numbers as to necessitate placing them underground, as they had been strung on poles and roof tops. This was objectionable on account of the corrosion of the iron wires by chimney gases, wires breaking when loaded with snow, and the cost of roof repairing, the unsightliness of the construction and lack of room for more wires. It was, however, the only possible way known at that period. The overhead method was soon outgrown. Some streets in the larger cities had become black with wires. Poles had risen to 50 feet in height, then 60, 70 and 80. Finally, the highest of all pole lines was built along West street, New York City, using 90 foot poles of Norway pine, and carrying 30 crossarms and 300 wires. (Fig. 45). This condition of wire crowding was overcome by the development of cables, later described.

**Telegraph Grounded Circuit. Difficulties.**—When the ground was used for the return circuit, not only was the talking distance limited by the confusing effect of all sorts of disturbing currents from the atmosphere and from neighboring telegraph wires, but also, when a second telephone wire was strung alongside of the first, even though perfectly insulated from it, conversation carried on over one of these wires could be heard plainly on the other.

**The Balanced Metallic Circuit. Open Wire Lines.**—In 1883, it was discovered that the bad effects of these disturbing currents could be greatly lessened by severing the earth connection from the ends of each wire, and substituting a second wire for the return circuit through the earth. The new arrangement was known as the “metallic circuit.” For the reason that the “metallic circuit” principle involved rebuilding practically the entire plant, telephone engineers sought less costly methods of reducing the electrical disturbances.

Between 1885 and 1892, large numbers of so-called anti-induction devices were proposed and investigated. None of these proved sufficiently successful to warrant adoption. Those that killed induction killed transmission as well. A system using a common return wire for a number of telephone circuits was used to a considerable extent. It reduced the disturbances due to ground potentials but was not effective against induced currents. The reconstruction of the telephone plant on the metallic circuits basis was carried out largely between 1890 and 1900.

To aid further in rendering metallic circuits free from induction from power circuits and from crosstalk, the wires were transposed (i.e., interchanged in position on the crossarm) at periodic intervals of space. The first transposition scheme was worked out in 1886.
Fig. 46 shows a typical transposition diagram for the 10 wires carried on one crossarm of a line. On this diagram the vertical lines represent poles 1,300 feet apart, that is, about every 10th pole. The interchange in position of the wires is indicated by the crossing of the horizontal lines which represent the wires. At the points indicated by small circles, special types of transpositions are placed to admit of phantom circuit working (described below). To ensure quiet circuits, the apparatus used with metallic circuits has to be carefully balanced when arranged for talking. Wherever a ground connection is used, as in some forms of signalling, it has to be placed at a neutral point in the telephone circuit.

Balance in the line circuits is attained by uniformity in the wire used and by suitable arrangements in its installation and mainten ance. Any slight imperfection in the balance of the line conductors in phantomed circuits manifests itself by crosstalk between the phantom and its constituent circuits. While the metallic circuit, transposed according to the methods first devised by the Bell engineers, eliminated the outside disturbances that existed at the time, this was not the state of affairs for long. Powerful electric light and power circuits began to spring up and methods which had formerly been successful in protecting the telephone from disturbing currents were not effective against these new high powers. Years and years of work have been devoted to safeguarding the telephone circuit from these disturbances, and each new success which the telephone engineer has accomplished in this direction has been followed by a further advance in high potential and high current on the part of the power circuits. It has been said with truth that if these high power circuits had been discovered and in use before the telephone was invented, the results obtained from the first telephone lines would have been so utterly impracticable that it is hard to think of any one being rash enough to regard the telephone as having any commercial value.

Phantom Circuits.—It is possible to make a third circuit out of two metallic circuits by connecting them together, with suitable apparatus, in a peculiar way. (Fig. 47.) The third circuit is termed a "phantom" circuit. Conversations can go on over a phantom circuit without disturbing, or being disturbed by, simultaneous conversations over the two metallic circuits from which the phantom circuit is formed. The operation of the phantom circuit depends upon the principle that if two currents of equal strength, and similar in all respects to form, are transmitted simultaneously over the two wires of a circuit, they produce no sound in the telephones associated with that circuit. Fig. 47 shows how the phantom current is equally means of connections to the middle repeating coil windings, so that it m.

![Diagram showing use of Phantom Raps](image)

### Fig. 46. Typical Transposition Diagram for Transposition Sections over 21,120 feet in length. Phantoms on pins 3 and 7-10.

Aerial and Underground Cable Construction.—In 1881, the first underground cables were laid along road track at Attleboro, Mass. The insulation known at that time, rubber or gutta percha, was found to be unsuitable for telephone work. Conversation conducted through cables of this kind that insulation was muffled, overheard from one circuit to another, and troublesome. In 1882 several cables were laid at Boston, Mass., the longest of which was about 1,500 feet. It was found that cables were cut in connection with the suburbs, the voice was indistinct that, unless the difficulty was removed, the connection with points out of city would have been almost, if not entirely, useless to those whose wires were underground. Type after type of cable was installed and be withdrawn in a few years and replaced by something better.

The use of rubber insulated cables followed by the development of a cable in which the individual wires were covered with insulation and drawn into a pipe were then filled with oil. This oil-filled carrier the telephone circuit through.
Fig. 42-B — Front View of Single Position of Modern Common-Battery "A" Switchboard
Fine Wire Cable.—The extraordinary increase in the number of the telephone wires, and the difficulty in many places of obtaining additional space underground led to the development of the so-called fine wire cable, a modification of cable employing wires No. 22, B. & S. G. in size (0.0233 inches in diameter). The progress made in this development is shown in the following table which gives, for cables of No. 22 gauge wires, about 2½ inches in outside diameter, the date when a cable of the given number of pairs was made available for commercial use.

During 1914, there was developed a type of underground cable carrying 1,400 pairs (2,400 wires) No. 24 B. & S. G. in size (0.0201 inches in diameter). Fig. 48 shows a cross-section (reduced in size) of this cable. The improvement which it represents may be understood when it is known that to carry the same number of open wires on poles would require large huge pole lines of the size shown in Fig. 45. The economics accomplished by these improvements are not limited to the cables themselves, but extend to the underground duct systems whose capacity is multiplied enormously by the increase in the number of wires which each cable may carry.

It was early found that lead alone did not possess the requisite corrosion-resisting and strength properties for underground cable sheaths. Aerial cables, furthermore, are subject to peculiar conditions causing vibration in the cable, and a tendency to crystallization of the sheath if pure lead is employed. For a long period, cable sheaths having the proper qualities were made of lead alloyed with about 3 per cent of tin. Considerable increases in the cost of tin led to experimental investigations of a wide range of other alloys. This resulted in finding, in 1912, a cheaper and at least equally efficient alloy in which the lead was alloyed with a very small amount of antimony.

Early Intercity Cables.—In the earliest interurban cables every effort of the engineers was bent toward improving transmission efficiency by using wires of large size so arranged in rolling as to secure a soft core giving the lowest practicable mutual electrostatic capacity between the wires of a pair. Wires as large as 0.958 inches in diameter were used and cables of this character as long as 25 miles were placed. In European practice, the use of wires even larger than this continued for many years. In the United States, the development was in the direction of using smaller wires provided with means for improving their transmission efficiency so that it not only equaled, but considerably exceeded that obtainable with the larger and more expensive wires. By 1902, the art had so advanced, by the use of Pupin loading coils (described below) and other improvements, that a loaded cable for suburban toll service was successfully installed between New York and Newark. By 1905, a loaded cable 20 miles long had been extended from New York in the direction of Philadelphia, and by 1906, a cable 90 miles long was successfully operated.
TELEPHONE

between these two cities, but in the then state of the art, that cable could not be used beyond Philadelphia or New York.

**Boston-Washington Underground Cable.** During the year 1913 such advances were made in the art of building and balancing underground circuits, and such improvements in the use of repeaters (described below) that it became possible to talk satisfactorily by underground wires from Boston to Washington, a distance of about 480 miles, employing a cable (Fig. 49) so designed that the phantom principal could be employed in it. At the present time, there are underground cables along this whole route, furnishing service of the highest reliability between many important cities, the number of cables varying from two to four, depending on the density of the telephone traffic.

Loading is used on all the circuits in these cables, and repeaters are applied to a large proportion of the circuits over 60 miles in length. The Boston-Washington telephone cable is several times longer than any other in the world. These developments tended to increase greatly the long-distance traffic and to accomplish enormous savings in the amounts of copper which otherwise would have been required to establish communication between remote points.

**Telephone Transmission Theory.** In telephony, as already described, mechanical vibrations of the transmitter diaphragm set up electrical oscillations. These are transmitted over the wire and set up corresponding mechanical vibrations of the receiver diaphragm. The following section deals with the electrical characteristics of the telephone circuit and the transmission of telephone currents over it.

To develop the principles of telephone transmission, it is necessary to know the character of the speech waves. For ordinary practical work, satisfactory results are obtained on the basis that each wave, broadly the overtone of the vowel, consists of a carrier wave at some frequency characterizing the vowel, from 300 to 400 cycles per second, on which are superimposed, §

**Fig. 49.—Diagrammatic cross-section of Boston-Washington Underground Cable. Outside diameter, 2 9/16 inches.**

### Differential Equation

The differential equation determining the transmission of current over the line with these constants is as follows, *a* being the constant for the line, *b* for the distance measured along the line and *c* for the time:

\[
\frac{d^2i}{dx^2} = \left( \frac{1}{LC} \frac{di}{dx} + [RC + LG] \frac{i}{dt} + RG \right)
\]

For a current of a given frequency 1 cycles per second, there may be deduced from the above equation, the following expression for the impedance at any point on the line, when the current at the send end is 1 amp.

\[
i = \frac{-ax}{1 + \omega^2 \sin(p - \beta x)}
\]

In this expression are used two constants, *a* and *b*, known respectively as the propagation constant, and the wave length constant. The expressions for these constants are:

\[
a = \sqrt{\frac{1}{V \sqrt{(L^2 + R)(L^2 + G)}}} + \frac{1}{RG} - \frac{1}{L}
\]

\[
b = \sqrt{\frac{1}{V \sqrt{(L^2 + R)(L^2 + G)}}} - \frac{1}{RG} + \frac{1}{L}
\]

The first of these constants determines the rate at which the current diminishes in value as it passes along the line. The second determines the velocity at which electrical energy is propagated along the line. Another important constant of a line is its so-called "charac
teristic impedance," which is the ratio of the current to the voltage applied to it at the current end.

In terms of the above noted constants, the expression for it is

\[Z = \sqrt{\frac{R + j \omega L}{V_0 + j \omega p}}
\]

Where a line is not electrically long, assumed to be terminated with an impedance differing from the characteristic impedance of the line, the above formula as given for the current at any point on the line will not be satisfied. The equations, which are almost identical, however, may be used in this case.
ne must be modified to take account of reflection effects which take place due to changes in impedance. Such reflection be reduced, in practical cases, by a transformer of proper ratio between or between a line and terminal apparatus in a different impedance. An analysis of formulae will show that not only is the volume of energy received at transmitted, but the characteristic of the speech wave. In addition to this distortion, there is further due to transient effects of different rates, the higher frequencies undergoing the attenuation. Therefore, not all of the transmission is transmitted, but the characteristic of the speech wave is reduced. Lines.—"Loading" is a practice for increasing the efficiency of telephone circuits by increasing the mutual inductance of the circuit, but the practical possibility of doing this has been realized but no one to point out any practical increasing the distributed mutual-telephone circuit without bringing into operation the other which. Vaschy, Heaviside and others suggested or unsuccessful tested the mutual inductance of coils on a means of increasing their efficiency. No practical results their work and no actual has made in the matter of using a small number of such coils is contained in a single case as shown in Fig. 52. Fig. 53 shows a typical form of loading coil of the kind applied to open wire lines.

The function of these coils is to reduce attenuation losses in the line. They bring in no new supply of new energy, but make the line a better conductor for telephone currents. On open wire lines they are placed at intervals of about eight miles. On cable circuits they are placed at intervals of from one to two miles depending upon the size of the cable conductor to be loaded and the character of the loading. The use of these coils approximately doubles the range of transmission practicable with open wires of a given size and increases the range of cable transmission three to four-fold. In other words, by means of loading it became possible to talk over cable circuits three to four times as far as formerly, with equally good transmission results.

The fundamental principles of loading, as disclosed in the patents of Pupin, were in mathematical form. The development work required to embody the theory of loading in practical loading coils has been a task, constituting the work of years of a large group of highly trained scientific men on the technical staff of the Bell System. The application of loading has comparatively recent been extended to power circuits so that it is now possible to load not only the physical or side circuits composing a phantom circuit, but also the phantom circuit itself. Phantom loading is applicable to properly constructed cables (called duplex or "quadded" cables) as well as to open wire lines.

**Telephone Repeaters.**—A highly important method of improving the transmission efficiency of telephone circuits is the insertion into them of devices known as "telephone repeaters," which increase the amplitudes, or strength, of the telephone currents that pass through them, without changing the effective form of the waves. The energy added by the repeaters is drawn from a battery associated with the repeater itself.

The telephone repeater may be considered as consisting of two parts: (a) the repeater element, that is, the amplifying device itself; and (b) the circuits and associated apparatus for connecting the repeater element, or elements, into the line.

The first form of repeater element to come into commercial use was the so-called "mechan-
ical" type consisting, in principle, of a telephone receiver acting directly into a telephone transmitter. A simplified diagram of this repeater is shown in Fig. 54. Currents received from the line flow through the winding of a receiver magnet acting upon a diaphragm carrying one electrode of a transmitter button, thus causing to be put out currents of approximately the same form as the incoming waves, but of greater amplitude.

The preferred form of telephone repeater element is now the "vacuum tube" type. This was developed by the Bell engineers from a device known as the "audion," invented by DeForest for other uses. The structure of this type of element is shown in Figs. 55 and 56. It consists of a highly evacuated glass bulb in which are placed three parts, known as filament, grid and plate. Referring to Fig. 56, the filament is composed of materials which, when heated by current from battery $A$, give off electrons actively. Under the action of battery $B$, these electrons pass from the filament to the flat electrode, known as the "plate," thus constituting an electric current. This is termed from its grid-like structure generally at a potential filament by battery $C$. The grid sets up variations in potential between the grid and filament, and thus produced causes corresponding changes in the current between the filament and plate.

![Fig. 54—Simplified Diagram of Mechanical Type Repeater Element.](image)

![Fig. 56—Diagram of Vacuum Tube Repeater. (The grid and plate at the left hand side of the filament are omitted for the sake of clearness).](image)

The circuits for connecting the repeaters into the line to give transmission in two directions are of various types, the two most common forms being shown in Figs. 57 and 58. The first includes a single repeater which amplifies the energy for transmission in either direction. The second includes two repeater elements for transmission in two directions. An important feature of these circuits is the balanced condition essential.

The circuit diagrams show certain apparatus such as the "balance," combination of coils and condensers, the actual line for balancing purposes, a "potentiometer," a device for adjusting; and the "filter," which serves as a certain undesirable current element.

Referring to Fig. 57, it will be seen if the lines in both directions are not balanced, similar impedances are produced, leaving the repeater cause no current to be set up in circuit of the repeater element. The circuits are sufficiently distance to be imperfect, and current, as the repeater element will cause currents to be amplified, thus setting up a circuit in which current will flow. If the circuit is not so great to produce steam, there may still be considerable distortion by it.

In the case of the second circuit, similar conditions hold, except that...
each line is balanced against an artificial line as indicated. If the unbalances at these points are not kept small, sustained oscillations may be set up as in the case of the other circuit, but in this case the circulating currents must flow through the two unbalances in series. If either balance is very good, the other unbalance may be large without unfavorable results.

The balances noted above must be obtained for all of the frequencies important in telephone transmission. The impedance of a circuit, measured at any point, is affected by every part of the circuit, the amount of the effect caused by any part being dependent on the amount of attenuation between the part being considered and the point at which the impedance is being measured. It is, therefore, evident that these balance conditions are affected by every part of a circuit on which the repeaters are used, so that every part of a circuit containing repeaters must be carefully designed with respect to this characteristic. For high grade repeater elements, the improvement obtainable under any particular circumstances is dependent, almost wholly, on line conditions.

Transcontinental Circuits.—The best known circuits on which repeaters are used are those which place the cities along the Atlantic seaboard in telephonic communication with the cities along the Pacific Coast. Without loading and repeaters it would be impossible to talk 3,000 miles with the same grade of transmission that is actually obtained over these circuits 4,000 miles in length.

Further Advances.—By the joint operation of loading and repeaters, coupled with other ground cable, are generally subject to disturbances from lightning, and to the possibility of accidental contact with ordinary electric light and power distribution wires. When these conditions exist, protectors are successfully used on the telephone lines to minimize the hazard to persons and property. It is not practicable to use protectors which will handle the large amounts of energy that would be imposed on telephone lines by high voltage transmission circuits coming in contact with them. Protection from such circuits is obtained by keeping them separated from the telephone circuits wherever practicable and, where adequate separation is not practicable, by building the lines of high strength so as to prevent contact.

Multiplex Telephony.—The only type of multiplex telephone apparatus that has been developed into form suitable for commercial use is known as the carrier current multiplex system with which it has been found commercially practicable to transmit five telephone conversations simultaneously over the same pair of wires. This requires sending over the line five different currents at the same time and providing means, at the end of the line, whereby these currents may be completely separated from each
other so that each current, coming from one particular telephone at one end, may go to a particular telephone at the other end, although on the line the five currents have all been mixed together. This is done by combining each ordinary telephone current with a current of definite higher frequency, termed a "carrier current." The frequency of each of the carrier currents is different from that of the other connections being completed within board. Large cities have a number of boards, connected together by trunk lines connecting each switchboard with other important switchboard in the reach of the smaller central offices, in sections of a large city, from central particularly those in a distant portion.

![Simplified Diagram of Circuit with Two Repeater Elements](image)

carrier currents used on the same pair of wires and is adjusted to the separating devices at the distant end of the line. The arrangement is applicable on lines of such length that the installation of the necessary apparatus gives a saving in cost compared with erecting new circuits.

Telephone Systems.—The Bell System consists of nearly 11,000,000 telephone stations scattered all over the United States. Each station is enabled to connect with the nearest central office, of which there are upwards of 5,700, by a pair of wires called the subscriber's line, or "exchange circuit." Due to party lines and private branch exchanges, about 3,700,000 exchange circuits serve to connect all the stations with the central offices. In places of moderate size there is usually one switchboard, to which all of the subscribers' lines are brought, local

it is sometimes necessary to make use of or more trunk lines, connected together by intermediate operators for the purpose of relaying such a call. In the business part of the largest cities where the telephonic is at the highest, more than one switch sometimes placed in a central office building.

In New York City, the largest exchange in the world, there are upwards of telephone stations, connected by more than 400,000 lines with 87 central offices which are interconnected by more than 50,000 trunk handling local calls only.

Connections between exchanges in cities are completed over toll and local lines. More than 3,000,000 miles of use for this purpose. Special trunks, usually employed for connecting central with toll and long distance.

**TELEPHONE SYSTEMS, COST OF INSTALLING AND MAINTAINING.** See TELEPHONE SYSTEMS, INDEPENDENT.

**TELEPHONE SYSTEMS, Independent.** Under this designation are placed all those telephones not owned by Bell system companies, such as certain telephones used for military purposes, some of the telephones in those cities where there are two or more exchanges existing and operating side by side, such interior telephones as are used solely for intercommunication in buildings, hotels, factories, etc., and some of the farm or rural telephones.

The original Bell patents expired in 1893 and for 17 years prior to the expiration the Bell patents were held to the first inventor of the telephone were upheld in the United States and all telephones in commercial use were supplied under license by the predecessors of the American Telephone and Telegraph Company. Upon the expiration of the original Bell patents, numerous manufacturers began to supply telephone instruments and considerable numbers of these came into use especially in the rural districts.

*Transactions of American Institute of Electrical Engineers.*
For many years the independent development of the telephone business has been in progress largely in the rural districts where local and rural independent companies are established. A large proportion of these have connection contracts with the Bell system. These lines are found in every part of the country, uniting homes, factories and camps by means of party lines, which allow conversation between the different stations of the line as well as from any station to a central exchange.

Up to the present time the independent telephone movement has placed more than 800,000 American farmers, timbermen and miners in touch with their markets, their own communities and towns and cities near them. The movement has been especially active in the Middle and Western States. These telephones are not only for general purposes of communication, and in numerous ways for securing information regarding market quotations, but also in gaining information of financial value and advantage. The independent telephone business, however, is not limited to the country districts, but has established itself in a number of cases in towns and cities.

In many cases, where two systems have come into existence, side by side, arrangements have been made to consolidate the systems by one interest disposing of its plant to the other. Such consolidations have very generally met with the approval of regulatory bodies and in this way many telephone users have had their range of communication greatly extended.

The growth of the independent systems increased over 250 per cent in the decade beginning about 1902 and ending in 1912. In the year first named there were reported in operation 9,092 independent systems and lines with 1,512,527 miles of wire. The number of telephones operated on these systems was 1,053,866 and the number of messages or conversations per annum was estimated at 1,996,024,493. In the year 1912 the independent systems had increased to 32,157 with 5,115,140 miles of wire and operations of 4,642,345 telephone instruments. The estimated number of messages or conversations over these independent systems in the latter year was 4,602,431,409. Of the total number of stations in the Bell system, in 1918 (10,992,325), 3,700,568 were owned by local cooperative and rural independent companies or associations having subconnection or connection contracts with the Bell system. There are in the United States 9,336 independent companies whose telephone systems connect with the Bell system, and about 1,600 independent companies whose telephone systems do not connect with the Bell system. There are also a large number of rural lines and systems which connect with the telephone systems of these companies, over 20,000 of which are connected with the Bell system. There are about 1,000,000 stations owned by independent companies not connected with the Bell system.

The exigencies of war service emphasized the great adaptability of the telephone to many situations and there was an increased call for telephones systems for reporting enemy operations, directing the movements of troops, munitions and supplies, controlling artillery fire and in numerous other ways increasing the effectiveness of the armed forces.

The scientific investigation of electric waves has resulted in a clear understanding of the generation, propagation and reception of these waves and in the development of wireless telephony. The requirements of successful radio-telephony began with a system of undamped waves of very high frequency so that the wave trains when received were not within the range of audibility. Wireless telephony owes much to the work of the engineers at the American Telephone and Telegraph Co., who, in the latter part of 1915, succeeded in telephoning by wireless from Washington, D.C., to Paris, and from Washington to Hawaii a distance of 4,900 miles. The expense of installations for long-distance wireless telephony may limit competitive systems, but it is possible to look for the widespread employment of the short-distance wireless telephones.

Arms in the field employ portable wireless sets for insuring communication between scattered commands. Some sets for use in armored country are arranged to be carried on wagons, one for the generator and another for the wireless apparatus. The European War gave especial impetus to the development of wireless telephony, especially as applied to destroyers and aeroplanes due consideration being given to the extremely limited space available and the limited weight that could be carried. On board airships of the Zeppelin type it is possible to employ a powerful apparatus, hence a greater range can be covered.

A typical airship installation consists of a transformer, quenched spark gap, capacitors, inductance, aerial wire lowerer, down winch, anemometer, rapid-change switch for current wave-lengths and an alternating-current generator driven off one of the engine gensets and an airship. Such a set weighs about 55 pounds without the alternator and has a range of 60 and 120 miles. The aerial wire is 200 feet long when fully paid out.

TELEPHONES, Farm. See Telephones, Independent.

TELEPHONY, Wireless. Prior to the invention of the telephone, signals were transmitted by means of a lens upon a cave mirror carried on the exact focus of the lens. This device, Fig. 1, a beam of light transmitted by means of a lens upon a cave mirror, was employed by Bell, the inventor of the telephone, in which light rays were used to transmit sound. This device, Fig. 1, a beam of light transmitted by means of a lens upon a cave mirror, was employed by Bell, the inventor of the telephone, in which light rays were used to transmit sound.

rate of air vibrations or oscillations due
anges from about 20 to 20,000 per
wireless telegraphy wave or
on is equal to the speed of electricity,
miles per second, divided by the number
ations per second, it is evident that the
of electrical oscillations of 20 to 20,000
ymphs is comparatively great. Hence, to
tral without wires electrical osc-
set up primarily by the voice by means
telephone transmitter, aerial wires about
; in length would be necessary, which is
ible.
reasons that will become obvious it may
miss to refer here to the Van Ryssel-
system of Simultaneous Telegraphy and
y which for years has been in serv-
 large scale in this country. This sys-
briefly described in the article on Tele-

Any action of the telegraph sig-
the telephone receiver is prevented by
duction coils in the circuit which makes
and fall of the telegraph currents so
that the diaphragm of the telephone re-
merely deflected and does not produce
iable sound. Upon this gradual rise and
the telegraph current is superposed the
ions of the speech waves set up by
phone transmitter on the same wire,
unciation of the circuit. In electrical dia-
struments. Quoting from Mauer,
amic Telegraphy, p. 347, "the the-
operation of simultaneous telegraphy
phony may be briefly outlined as fol-
Assuming, for example only, the
of the telegraph current to be 2,000
 of the telephone current to be 1. If,
e diaphragm of the telephone receiver is
or in process of gradual attraction by
ph current of positive direction, a tele-
current of the same direction be trans-
 the total current will be suddenly in-
to 2,001 and the diaphragm will be
minute impulse toward its mag-
nould then a negative telephone current
the telegraph current remaining as be-
current on the line will be suddenly
1,999 and the diaphragm by its own
cedes rapidly from its magnet. In the
operation of these systems many hun-
t Pulsatory currents might be sent dur-
time taken to transmit one telegraphic
ent and thus, while the diaphragm is be-
bly attracted to or is gradually receding
from its magnet owing to variations in the tele-
graph current, at the same time it may be mak-
hundreds of intermediate forward and
ward movements of less amplitude, due
the variations of the line currents caused by
the telephone transmitter in transmitting speech
waves." In present day language the foregoing
would be termed a modulation of the telegraph
current in accordance with the variations of
current due to voice waves.
It was recognized by the early workers in
wireless telegraphy and telephony that if it
should be found practicable to modify or modu-
late the high frequency ether waves utilized in
wireless telegraph operation, it would be pos-
sible to transmit speech without wires to a dis-
tance approximating that of wireless telegraphy.
A difficulty, however, in avail of high fre-
quency electromagnetic waves for this purpose
has been that as ordinarily obtained from the
discharges of a condenser at the spark gap in
wireless telegraphy such waves are inten-
tent and their amplitude is not uniform, but is
quickly damped, as noted in the article Wire-
less Telegraphy. Thus, in case of an alter-
ating current generator developing a current
of, say, 60 cycles, or 120 alternations per sec-
ond, there will be 120 sparks per second at the
gap if at each alternation the oscillation
is charged to sparking potential, which
is not always the case. Assume that each dis-
charge of the oscillation circuit gives rise to
oscillations of a frequency of one million per
second in that circuit, with a consequent wave
length of 300 meters. The exact number of os-
cillations and wave length depends on the in-
ductance and capacity of the oscillation circuit.
(To conform to the word inductance the capac-
ity of a circuit is now frequently termed capac-
 itance). As the capacitance of the aerial
is usually supplied by the aerial wires and is not
readily variable, the frequency rate is varied
by placing an adjustable inductance in the aerial
ircuit in the shape of a spiral coil of wire more
or less of which may be inserted in or removed
from the circuit. The capacity of the aerial is
sometimes reduced, for short wave signaling,
by placing a condenser (capacity) in the aerial
circuit. In electrical diagrams a variable or adjus-
table condenser or inductance is conventionally
indicated by an arrow through the apparatus.
In the case of point if the oscillations were
maintained throughout the interval between dis-
charges there would be 8,334 oscillations per
spark, that is, the quotient of 120 divided by 120.
Since, however, the oscillations in such a
ircuit die out very rapidly, due to the damped
ing effects mentioned in the article Wireless
 Telegraphy, there are only two or three strong
oscillations for each discharge in highly damped
circuits and 10, 20 or 30 strong oscillations in
less strongly damped circuits. Hence oscillations
are only maintained during a brief interval
between spark discharges, leaving approxi-
mately the one hundred and twentieth of a
second between such discharges during which
there are no oscillations in the oscillation circuit
and at that time no waves are radiated from
the aerial. In wireless telegraphy these inter-
mittent or group oscillations after reception by
the detector are observable in the telephone
receiver as a continuous tone or buzz which is
broken into dots and dashes of the Morse alpha-
bet by a telegraph key. If the attempt were made to superpose vibrations corresponding to voice waves upon these intermittent or broken oscillations, it is evident that portions of the voice waves set up by the transmitter would be lost.

Kennedy has mathematically demonstrated that speech might be transmitted telephonically with harmonics, or overtones, not exceeding 2,000 per second, but Poulsen has found by experiment that for satisfactory speech a frequency of at least 20,000 per second must be employed, otherwise disagreeable noises will be heard in the telephone receiver. Therefore, continuous or sustained oscillations of a fairly high frequency and uniform amplitude are essential upon which to superpose the voice frequencies for successful wireless telephony. To this end fairly successful efforts have been made by different inventors to produce a machine generator, or alternator, capable of driving an alternating current of very high frequency notably by Fessenden, Goldsmith and Alexander. Owing to the mechanical difficulties of construction of such machines it is perhaps a question whether they will ever be successful in general use. Nevertheless such machines have given and are giving good service in a number of instances. An idea of the difficulties of construction of high frequency alternators may be gained from a recent paper by Alexander, Proceedings American Institute Electrical Engineers (October 1919).

Another method of obtaining sustained electrical oscillations is known as the singing arc, due to Duddell, who discovered that when an arc lamp is in shunt with a capacity and an inductance of given proportions, a musical tone is set up in the arc. Ultimately Duddell obtained frequencies of 40,000 per second from this source. An explanation of this phenomenon is that the arc circuit is divided into two parts, one current flows from the arc circuit into the condenser or capacity circuit which decreases the current flowing in the arc. This increases the electromotive force between the terminals of the arc, causing still more current to flow in the condenser circuit raising its electromotive force above the normal voltage of the arc. Consequently the condenser begins to discharge back into the arc, increasing the current therein and reducing the electromotive force between its terminals, and the reverse process is set up, and in this way continuous oscillations are maintained in the arc and shunt circuits.

When sustained oscillations are comparatively uniform in amplitude and their frequency is above audibility these oscillations are not heard by the telephone receiver. But, while the telephone receiver or at least the human ear will not respond to such high frequencies, if the amplitude or contour of the oscillation waves be modified by speaking into a microphone connected with the oscillation circuit, or in the aerial circuit of a wireless system, a telephone receiver will under proper conditions reproduce the speech spoken at the transmitter, virtually as speech is reproduced modulating the amplitude of a beam or a telegraph current in the case previously cited. The terms "high frequency" and "audible or low frequency oscillations" are now commonly used to the inaudible high frequency oscillations and audible or low frequency oscillations, respectively, in wireless telephony.

The discovery of the oscillating arc was the way for the use of sustained oscillations at high frequency and by means of modulations of Duddell's device much progress made in wireless telegraphy and telephony. Such devices are now sometimes used radio transmitters or arc converters.

An important improvement in the oscillating arc is that due to Poulsen. Poulsen arrangement the positive electrode is the arc is a water-cooled copper cylinder and the negative electrode is carbon. The arc is in a strong magnetic field which tends to blow the arc, after the Elihu Thomsom. The direct current supply for the arc current generator supplying current to the arc changes from alternating currents of frequency of 60,000 per second. The power efficiency of the arc converter is 20 per cent.

A very important source of sustained frequency oscillations in wireless telegraphy and telephony is the electrode in a high vacuum tube to which extended reference will be made herein.

A great advantage of sustained oscillations in wireless telephony and telegraphy is that the property of resonance is more fully utilized than when intermittent oscillations are employed. Be noted that in wireless telegraphy and telephony reliable operation the receiving apparatus is practically the same. In wireless telegraphy the full effect of the reflected waves is utilized. In wireless telephony only a small portion of the emitted wave energy is available, that is caused by the action of the telephone receiver, estimated to be about 5 per cent. of the total energy radiated. This, however, is amplified by the high voltage detector and is not now of much importance. See TELEGRAPH, WIRELESS.

De Forest Wireless Telephone.—In 1900 De Forest outlined an arrangement of the De Forest wireless telephone system employed in 1909; possibly prior thereto. A singing arc is employed as the source of sustained frequency oscillations. C is a variable condenser. L is a transformer or tuning coil, the steel wire of which is in series with the wire A, and a microphone transmitter amplifies an arc with carbon. Carbon is the electrode and the carbon is the stationary contact, or inductances, in the circuit, used to shut out the high frequency oscillations of the arc from the generator.
s up in the circuit, $C$, $p$ sustained are radiated as electric waves aerial wire $A$. Speech spoken into $M$ modulates the amplitude of these actially in a manner equivalent to $1$ of the voice currents in the Varn- the simultaneous system of telegraphy shony upon the telegraph currents. There is, of course, the difference of latter case it is the slow telegraph of current that are modulated by the in the telephone receiver. The incoming high frequency, or radio sustained oscillations, as stated, do not perceptibly affect the telephone receiver owing to their regularity, uniformity of amplitude and high frequency, but the modula- tions of the amplitude of the incoming audio oscillations due to the microphone transmitter, being within the range of the human ear, are heard in the telephone receiver as articulate speech.

**Wireless Telephone Transmitters.**—The transmitters for this work necessarily require high current strength in the transmitter circuit. This develops heat in the carbon granules of the microphone transmitter, which leads to packing of the carbon. This impairs or stops the transmission of voice waves. The packing can be broken up by tapping the transmitter at suitable intervals, and De Forest provides a special device for this purpose. In other cases a device consisting of a number of tubes leading from a single mouthpiece to a number of transmitters, all acting upon the one circuit, is employed. Fessenden uses a special trans- mitter for this work, by means of which a current strength of 15 amperes is modulated successfully. For aeropeone service during the war transmitters of special design were found to be necessary if successful results were to be obtained. In this service, besides difficulties due to packing, precautions had to be taken to annul engine, propeller and other external noises. To this end the diaphragm of one type of transmitter is so constructed as not to re- spond readily to air vibrations below 200 or above 2,000 per second. In another type a perforated plate is interposed between the speaker's mouth and the diaphragm of the transmitter, which device haffles the movement of extraneous sound waves toward the dia- phragm while the voice waves spoken directly into the mouthpiece are not impeded. Still another device employed in this service con- sists in leaving the back of the transmitter open in such a way that exterior noise impinges on the back and front of the diaphragm of the transmitter with equal strength, effecting no result, whereas the voice waves hit the dia- phragm in one direction only and thus set up the required variations in the transmitter circu- it, even although at such times the pilot or observer cannot hear his own voice.

**Three Electrode Vacuum Tube Oscillator.**—As previously intimated the De Forest three electrode vacuum tube is now used as a source of high frequency sustained oscillations, and many different arrangements of circuits have been designed to utilize this remarkable feature of these tubes, now in practice frequently designated vacuum tubes or VT's. One such arrangement of circuits to obtain sustained oscillations is shown in simple form in Fig. 4, termed a vacuum tube oscillator. It illustrates the "feed back" or "regenerative" coupling of circuits, perhaps first devised by Armstrong. $F$ is the usual filament, $G$ is the grid, $P$ is the plate of the tube proper, $B$ is the heating or lighting battery, $r$, $r'$ are re- generative or feed-back tuning coils. $C$ is a condenser across the filament grid-circuit. Closing the circuit or jarring the tube will cause an initial impulse or oscillation in the grid-plate circuit, including coil $r$. This
oscillation in turn reacts on the grid-filament and r circuit, which again reacts on the former circuit, thereby producing a feed-back or regenerative oscillating current in the tube that may be termed self-perpetuating. After a brief interval a steady sustained oscillation is produced. The coils r, r' and condenser C are adjusted to oscillate at a desired frequency in the usual way. By means of this tube oscillation from one-half cycle to 20,000,000 per second are now obtainable.

![Fig. 4.—Vacuum Tube Oscillator,§](image)

It has been noted by another writer in explaining the oscillating feature of these tubes that in order to set tube circuits into a state of radio frequency oscillation it is necessary that the connections be so made that the grid end of the grid inductance will be alternately negative and positive, as the plate end of the plate inductance is positive and negative. When the grid and plate radio frequency circuits are coupled with the proper phase relation any variation in voltage in either the grid or plate circuits will cause minute disturbance in the oscillation circuits, setting them into oscillation at whatever frequency they may happen to be adjusted to. For example, a slight variation of voltage in the plate circuit by any means whatever will cause its resonant circuit to oscillate at radio frequency, and the resultant current will act upon the grid circuit, setting it into action at the same frequency. The resulting radio frequency fluctuations of the grid potential will act upon the plate at the right time to keep the plate resonance circuit in a state of oscillation, and this state of affairs will continue so long as the proper supply of voltage and filament current is maintained, but not otherwise. The tube is able to generate alternating currents because of its amplifying properties. The energy delivered to the grid circuit in accordance with the actions just outlined will gradually increase in value until a maximum is reached, which is the maximum output the valve is capable of delivering.” Consult The Wireless Age, June 1919, p. 5, article on “Wireless Telephone Transmitter for Short Distance.”

In general De Forest gives the explanation of the vacuum tube oscillator as follows: “There is only one oscillating circuit. This circuit is such that a sudden change of potential impressed on the grid of such a character as to produce in turn an opposite change of value of potential on the plate. Thus the to and fro reciprocal and self-sustaining. In some respects the operation of the vacuum tube oscillator is perhaps the simplest of any class of circuits. A well defined example of a self-perpetuating circuit is that due to placing a telephone against the mouthpiece of a transmitter when a shrill whistle or howl is established. This phenomenon is noticeable in the transmitter and receive acousticon type. This effect is said to a series of reactions somewhat similar but much more complex than those in an electric door bell, another device self-perpetuates its own vibrations; a circuit is closed by the push-button case of the telephone howler let us explain its operation that a movement of the diaphragm of the receiver toward the net tends to weaken the diaphragm of the transmitter and hence the pressure of the carbon of the latter. This causes a weakening of the tension, allowing the diaphragm of the receiver to fall away, with the further result that the column is compressed, this tending to increase the pressure on the carbon again and increase the current strength in the diaphragm of the receiver, which actions are repeated over and over. Investigation of this phenomenon, as might be expected, that it is upon the fundamental set of vibrato receiver and transmitter, the length of column enclosed between them and oscillation period of this circuit. To references the attraction of the diaphragm of the receiver and to its falling perhaps rather broad terms, when considered that as near as can be calculated the amplitude of vibration of the said diaphragm reproducing speech is about the on millionth of an inch. While this pl has no direct bearing on the vacuum oscillator it is interesting as somewhat thereto and hence may tend to explanation of the device.

Colpitts Vacuum Tube Oscillator, and Repeater.—In Fig. 5 is shown a circuit due to Colpitts of a vacuum telephone transmitter with other circuits for providing a high vacuum tube oscillator, modulator and of radio and audio frequencies. In the circuit the circuits into which is put is termed the input circuits; it give out energy, the output circuit, the input circuit consists of the vacuum tube VT, modulator coil r, and filament F, as indicated by the. The output circuit indicated by consists of the plate P, filament F, coil T, and battery B, tery supplies current to plate P, the diode or choke coil K; b is pha battery. The secondary wire in series with the secondary of an transformer T' is to the

---

§ oscillation

---
ne transmitter circuit TC as shown.

Arrangement acts as a generator of high

currents by reason of the interaction of the
input and output circuits through the
transformer T and the circuit SC. These
generator currents are modulated by the
frequency currents due to the operation of
the phone transmitter TC through the trans-

cords T, T', and are transmitted by the
transformer or repeating coil T into the line.

![Diagram of Colpitts' Oscillator, Modulator and Repeating Device](image)

**Fig. 5.—Colpitts’ Oscillator, Modulator and Repeating Device.**

detection increases with the signal strength. Thus the receiver usually works out best in
seven stages, three radio, one detector and three audio stages. Properly designed sets of this
kind operated non-oscillating and without regeneration, will give signals more than 10^6
times as strong as would be obtained with a simple one tube detector. By using a regenera-
tive feedback much higher amplification can be realized, but the operation becomes less
stable.

The degree of amplification due to the
vacuum tube amplifier varies under different
conditions of battery, circuit connections, etc.
In the case of an amplifier made for the United
States Signal Corps, the power of the output
signal was from 40,000 to 60,000 times that of
the input signal. In general it may be taken

![Diagram of Receiving Circuit with Detector and Two-Stage Amplifier](image)

**Fig. 6.—Receiving Circuit with Detector and Two-Stage Amplifier.**

The incoming oscillations are detected by
VT and are successively transformed and
amplified by transforming T, vacuum tube VVT,
VVT'; telegraph or telephone signals being
ed in the telephone receiver TR.

*Fig. 7.* From an article on “Radio Frequency Flicker” (in *Electrical World*, p. 570, 22
1919), “to build a reliable and efficient circuit of more than three stages at any one
ductor that the increase in audibility is according to
the square of six per amplifier. Thus if one
amplifier increases audibility six times, two
amplifiers will increase it 36 times, and so on. It
has been stated that by *the use of successive
vacuum tube amplifications, energy increases of
10,000,000,000,000 times have been obtained and
that a six stage amplifier permits the feeble
energy derived from a telephone receiver
when employed as a transmitter to light an ordinary tungsten lamp, or to produce a spark-
ing potential of several thousand volts. The amplifying power of the vacuum tube is, ho-
ever, not an instance in which something is seemingly obtained for nothing. In this re-
spect it is not comparable to the microscope or telescope. Rather, as pointed out by Batsel,
its amplifying effects are obtained in a manner analogous to the increase of power in a
direct current generator due to an increase of current or potential in the field circuit of the
machine, which in turn increases the density of the magnetic field in which the armature
rotates. The increased power in the dynamo output is disproportionately greater than the
increase of current in the field circuit and is supplied by drawing upon the mechanical
energy that revolves the shaft of the dynamo. Analogously the batteries that supply the heat
for the filament and the electric potential for the plate are drawn upon to supply the power
developed by the vacuum tube. In the case of the direct current generator the power is con-
trolled by the magnetic field; in the vacuum tube the output is controlled by the grid
potential through the agency of an electric field.

The transmitting and receiving vacuum tubes employed in wireless telegraphy and telephony
are differently constructed and require varying amounts of current. Thus one type of receiv-
ing tube used by the United States Signal Corps requires for filament operation 1.1 ampere
supplied by a four-volt storage battery, while the plate circuit is supplied by a 30-volt dry bat-
tery of 15 cells. The filament in the transmitting tube takes normally 1.30 amperes at
seven volts. The battery for the plate circuit of this tube ranges from 250 to 350 volts. The
power output of this tube is three to five watts. Consult article by Broad (Electrical
World, 22 Feb., 1919).

Wireless Telephony in Aerial Service—
The exigencies of the Great War led to rapid development in wireless telephone apparatus
and methods for army and navy needs in this country and abroad. There was especial need
for wireless telephony in the aerial service and great progress was made in meeting these
demands. For the latter purpose apparatus of minimum weight was necessary. The dimen-
sions, for example, of a complete outfit for the
use of the United States Signal Corps containing vacuum tubes, transformers and plate
circuit dry batteries are nine inches by seven
inches by five inches, and it weighs eight pounds.
The input transformer used in this set is of the shell type, wound with 6,000 feet of No.
40 stranded wire with paper insulation between the layers of wire, and weighs two
pounds.

In Figs. 7, 8, respectively, are given illustrations of transmitting and receiving types of
three electrode vacuum tubes used by the United States Army and Navy signaling de-
partments of the late war. In Figs. 9, 10 are illus-
trations of transmitting and receiving wireless telephonic sets utilized by the
United States Signal Corps. Wireless tele-
phone communication between flying in the air and between the planes and
stations; also by means of wire telephonic
between the men in the airplane itself,

becoming of more importance toward the end of the war, and many valuable improve-
ment were developed to facilitate this con

Multiple Wireless Telephony. — In wireless telegraphy the term duplex telegraphy signifies a system in which two messages are sent over wire simultaneously in opposite directions. Duplex telegraphy is meant the sending of two messages in the same direction over one wire simultaneously. The term multiplex telegraphy usually covers telegraph systems by which more than two messages are transmitted on one circuit at the same time in either direction. In wireless telegraphy the term "duplex telegraphy" is applied to means by which wireless messages are sent in opposite directions at once from two wires on one supporting tower, or preferably from two wires separate towers, and again preferably with respective transmitting and receiving aerials distributed a distance of 25 or 50 miles, in which latter case the transmitting and receiving apparatus are connected by land wires, making it possible to localize the transmitting and receiving operators in one room. The usual adjustments of the wireless apparatus made by attendants at the transmitting and receiving antenna. Utilizing remote control throughout the operation during the late war, the high-power wireless transmitter stations at Annapolis, Md., Eckerton, N. J., New Brunswick, N. J., and Asheville, L. I., were operated by four operators one room in the Navy Department building, Washington, D. C.

The term multiplex wireless telephony may be utilized as mentioned in the case of plex wireless telephony, but preferably it refers to the sending of two or more wireless messages simultaneously from different antennas near-by stations, say, ships of a fleet, and reception on the antenna of different ships a fleet at a distance. One of the best known multiplex telephone systems for this purpose is the Gray Harmonic Multiplex Telegraph system, formerly in use on land lines.

The Gray Harmonic Multiplex Telegraph.—By means of this system it is possible to transmit over one wire simultaneously four or more messages by means of electrical vibrations. In this system four tuning forks of different rates of vibration, say, 204, 320, etc., per second, are each given control of a battery by contact points suitably fixed on the forks. These batteries are arranged in series in a main line circuit. The tuning forks are kept in constant vibration by an electromagnetic device similar to that of the ordinary electric door bell, the forks being used as the armature of the magnet. When in operation these forks open and close the circuits of their respective batteries at a rate corresponding to the fundamental vibration of the forks, and thereby set up four different trains of electric impulses in the main line circuit, of frequencies equal to those of the respective vibrating forks. A Morse telegraph key is arranged to control the impulses set up by each fork in such a manner that a series of short and long electric pulsations corresponding to the dots and dashes of the Morse telegraph alphabet may be transmitted over the main lines by each key.

At a receiving station four electromagnets are placed in series in the main line circuit. The armatures of these instruments are iron reeds, fastened at one end, and attuned to vibrate at rates corresponding with their respective vibrating forks at the transmitting station. Hence, each reed will select and respond only to the pulsations of current transmitted by its respective vibrating fork. Contact points controlling a local current are also attached to the armatures of the receiving magnets and by this means the transmitted dots and dashes are received by a Morse telegraph sounder in practically the usual way.

Obviously, when all of these differing rates of current impulses are being transmitted at one time over one wire the resultant composite wave must be complex to a degree. Yet the Gray Harmonic telegraph system was in successful operation for several years between New York and Chicago on the lines of the Postal Telegraph Company. Indeed the degree...
of complexity of the resultant current referred to did not end with the operation of the functions outlined in the foregoing remarks. For, in addition to the four pulsatory circuits mentioned, an ordinary Morse duplex system was superposed on the vibrating system, this giving a sixplex telegraph system capable of transmitting six messages over one wire simultaneously.

The Heising Multiplex Wireless Telephone System.—In this system an arrangement measurably analogous to the foregoing is employed for setting up electric oscillations of different frequencies, which differing rates of oscillations are simultaneously radiated as a compound wave in space from the aerials of nearby transmitting stations and are selected and received at the receiving stations by suitably attuned wireless apparatus, in a manner to be described.

This system was installed experimentally on three or more ships of the United States navy, but owing to the declaration of war with Germany the tests were prematurely discontinued. The transmitting apparatus on one ship is outlined in Fig. 11. The apparatus on all the ships was similar, but certain of the tuning circuits on each ship were adjusted to different rates of oscillation. The plan employed is to transmit from the three ships a carrier wave of 25,000,000 cycles (150 meters). Then on one ship to modulate this frequency with an intermediate wave of 25,000 cycles, which frequency in turn is modulated with the waves due to speech. On another ship the same procedure is followed except that an intermediate wave of 35,000 cycles is employed and on the third ship an intermediate wave of 45,000 cycles is utilized.

Let Fig. 11 represent the ship (A) using wave modulates at $R$ the amplitude of the 25,000 cycle frequency set up by the oscillator $V'T$. In turn this modulated 25,000 cycle frequency after amplification in power tube $R$ is, through transformer $T'$ caused, at condenser $C$, to modulate the 2,000,000 cycle carrier wave developed by oscillator $V'T$. This does not modify carrier wave after increased amplification by the tube $V'T'$ is delivered to the transformer $T'$ to the antenna $A$. Batteries and other devices used in this system are not shown in the figure.

To avail of this arrangement each of three ships or other stations equipped with this apparatus will transmit a carrier wave 2,000,000 cycles. But one ship, say $A$, modulate this wave with a 25,000-cycle wave and $B$ will modulate it with a 35,000-cycle wave, and $C$ with a 45,000-cycle wave. The receiver $A'$ will tune his apparatus to a 2,000,000-cycle wave and to an intermediate frequency of 25,000 cycles. Ship $B'$ will tune his apparatus to a 2,000,000-cycle wave and to an intermediate wave of 35,000 cycles, and ship $C'$ to 2,000,000-cycle wave and to an intermediate wave of 45,000 cycles. The receiving apparatus is indicated in Fig. 12. $A$ is the aerial which encloses the 2,000,000-cycle tube and the appropriate tuning coils $T_C$ transformers $R_C$ and condensers $C$. Brackets $m$ encloses the intermediate frequency and detector tube $V'T$, the telephone receiver and the usual filament and potential battery. It is plain then that the receiving apparatus of the ships $A'$, $B'$, $C'$ will only respond to 25,000, 35,000, and 45,000 speech modulated radio waves, respectively, while all three receive and detect the 2,000,000 carrier wave practically as the vibrating reeds in the Harmonic Telegraph system respond only

![Fig. 11.—Heising Multiplex Telephone Transmitter System.](Image)
TELEPHONY, WIRELESS

ously in the same neighborhoods, using carrier waves of say, 189 and 190 meters in length, in addition to the wave 150 meters, and by modulating each of the two additional carrier waves with the frequencies of 25,000, 35,000 and 45,000 where it will be feasible to carry on separate wireless conversations simultaneously. The tubes $VT'$, the output circuits of which in turn are coupled through transformer $RC'$ to the input circuits of a battery of three power tubes $VT$. Similarly the output circuits of the latter tubes are coupled through the transformer $RC''$ to the aerial $A$, from which the modulated high frequency oscillations amplified and increased in power are radiated into space. $BB$ in the figure indicate the usual heating and potential batteries. The power tubes, it will be noted, are connected in quantity or multiple and not in series or cascade as in the case of amplifier tubes. See Fig. 6.

Long Distance Wireless Telephony.—An epochal series of experiments in long-distance wireless telephony was in 1915 conducted by the American Telephone Company in conjunction with the Western Electric Company and representatives of the United States navy and the French army. The most notable of these tests were perhaps those made between Arlington, Va., and the Eiffel Tower, Paris. Tests had been previously made between Arlington and Darien, 2,100 miles overseas, and between Arlington and Mare Island, near San Francisco, 2,500 miles overland. In the Arlington-Darien experiments speech was transmitted from New York City by land lines to Arlington, whence it was transmitted by wireless telephony to Darien. In the Arlington-Paris experiments difficulty was found in obtaining the use of the Eiffel Tower station, owing to the exigencies of the Great War which was then in progress. In these tests the Eiffel Tower station was used only for receiving. On 22 Oct. 1915, however, speech transmitted from Arlington to Darien for the first time over an English Channel wireless circuit was successfully received.
Arlington was clearly received in Paris, a distance of 3,600 miles. The radio-wave length employed was 6,000 meters. The antenna current employed at the Arlington station was about 50 amperes. The speech transmitted on this and other occasions was also received, and the voice of the speaker clearly recognized by the wireless operator in Honolulu, 4,500 miles from Arlington.

The general plan of transmission adopted at Arlington was somewhat similar to that indicated in Fig. 12, but of course the number and capacity of the senders and receivers and power tubes used at Arlington was greatly in excess of that used in shipboard or ordinary wireless telephone practice.

The Future of Wireless Telegraphy.—In view of the rapid development of wireless telephony within the past 8 or 10 years it would be unwise to attempt to place a limitation upon the extent of the use of this art within the next decade. The possibility of transmitting wireless telegraph messages a distance of 12,000 miles, from Carnarvon, Wales, to Sydney, Australia, has been demonstrated (2 Oct. 1918). Likewise the possibility of transmitting speech by ether waves a distance of 4,500 miles has been shown. These results are obtained by the use of the vacuum tubes oscillators and amplifiers. As a distance of 12,000 miles is half way around the earth and as the ether waves in traveling that distance traverse both sides of the earth, it follows that this is equivalent to transmitting a message from one point to any other point on the earth. Success in this method of construction of the three-electrode vacuum tube speech may be transmitted to any distance reached by radio-telegraph waves, it would seem that under favorable conditions it may be said that world-wide wireless telephony is now a possibility.

The high cost of very high-power vacuum tubes together with their low efficiency and limited durability is at present, however, likely to militate against their general use, but improvements in methods of construction of this apparatus will doubtless reduce its cost and increase its durability. The existing need of high and very expensive aerial wires in long distance wireless telegraphy and telephony is also a limiting factor to the extensive employment of these arts to very long distances.

Some of the chief obstacles to the extensive and successful use of wireless telegraphy and telephony in the past have been those due to statics and interference between or clashing of signals from different sending stations at nearby or even at remote stations. A great forward step toward the solution of this static problem is that due to the Weisen anti-static device. (See TELEGRAPH, WIRELESS). The interference problem is still to be solved.

It has already been noted, by the use of selective tuning devices, which only transmit and receive to waves or oscillations of a certain frequency, stations may cut out waves of other frequencies and thus avoid interference. Thus by the use of a standard wave length for certain circuits, as, following land telegraph practice, the other routes used by different wireless stations may be termed non-interfering; ether circuits may be and in fact are very generally at the present time, regular wave lengths for a given transmission circuit may be set at, say, 10,000 meters, and stations using that wave length in any part of that circuit to which the 10,000 meter length is assigned, would set up no or very little clashing of signals. It is known that a difference of 300 to 400 meters in wave length is ample to avoid interference between such stations. For instance, a 10,000-meter wave length station operating side by side with a circuit having a 10,400-meter wave length. For low wireless telegraph and telephone operation in other words, for high-power stations long wave lengths are essential. The minimum and maximum available wave lengths are, say, from 10,000 to 20,000 meters for distance signaling. Since the signals from very high-power stations are now recoverable over the world, it is obvious that if a wave length, say 400 meters, is required to prevent interference between any two such circuits, the total number of available wide wave lengths would be limited.

It may be noted that the short-distance signaling a difference in the wave lengths of about 20 meters is sufficient to prevent interference between such circuits. Even in short distance signaling, were all stations to adhere to an allotted wave length in any design, the number of available wave lengths ultimately would be reached. While the above conditions continue, the limitation of telegraphy and telephony will exist.

It is, however, not unlikely that methods in this branch of electrical science will render it possible to operate transmitting circuits without these limitations.

In wireless telephone interference nature does not occur as measures are taken to prevent such interference (termed it interference between circuits) by parallel wire transmission of telephone circuit. (See TELEPHONE). The effect of induction between parallel parallel wire transmission circuit is not as much as the receiving instruments employed on these systems are considerably sensitive to weak induction currents. Notwithstanding the real difficulties.
TELEPHOT—TELESCOPE

That may be termed universal wireless for social, commercial and other pur-
poses confidently expected by competent engineers and inventors that its utti-
sification is not beyond the possibility of actual realization. In the meantime telephony if only available, com-
fers for comparatively short distances, could be installed to great advantage.

erially successful machine has been

**ESCOPE.** The telescope is an optical at which the image of a distant
magnified so that it may be examined were but a fraction of its actual dis-
the observer. This instrument was
by the Dutch optician, Lippershey, the 17th century. The first use of it
onomical observations was made in
Galileo, who in 1609 invented the
form of reflecting telescope, called the Casse-
granian, invented by Cassegrain in 1672. The
optical principles here are the same as in the
Newtonian form except that the convergent
cone of rays from the mirror A is intercepted by a convex reflector B and sent back through
an opening in the centre of the mirror A to

Fig. 2.—Newtonian (eye-piece on side of tube).

Fig. 3.—Cassegrainian (secondary mirror convex).

The many and widely varying forms of telescopes may all be grouped simply as tubes
(Milton, seeing Galileo's in Florence, called it
the "Optik Tube"), in which are placed the several combinations of lenses or reflectors;
each combination, however, producing the one
result, namely, first, gathering the light from the object and concentrating it at the focus in a
brilliantly illuminated but small image; and,
second, magnifying this image with a micro-
scope called an eye-piece. One of the common
types is the refracting astronomical telescope
(Fig. 1), in which A is the object-glass or
objective, and F the focus, where the small
image is formed. The two lenses, C and D,
form the microscopic eye-piece, which mag-
nifies this image. The first reflecting telescope
was the Gregorian, invented in 1663 by James
Gregory. It has not survived. Fig. 2 repre-

TELESCOPE

1780, had a mirror 48 inches in diameter and a tube 40 feet in length.

In these forms of telescope the image of the object as seen through the eye-piece is necessarily inverted, which is, of course, unimportant in astronomical observations, but is a defect to be overcome in the terrestrial instrument. The most common type of terrestrial telescope is the Spy Glass (Fig. 4). The objective A has the same office as in the refracting astronomical telescope, and forms an illuminated image of the object at the focus F. This image is then magnified by a compound eye-piece made up of several lenses B, C, D and E, which carry the light to the eye in such manner as to erect the image and show it in its natural position. Fig. 5 represents the piece which would give a power of 3,600 diameters. Such high powers are, however, seldom required and can be used only in the clearest atmosphere. By far the larger proportion of astronomical observations are made with powers of less than 1,000 diameters. In telescope observations, the two elements "power" and "light," while equally important, are always in opposition. Thus an object viewed with

Galilean telescope, which is the same in principle as the ordinary opera glass. In this case the objective A condenses the light from the object observed, and would naturally make a small image at F, but the cone of rays, before reaching the focus, is intercepted by the double concave eye-piece C, and thence conveyed to the eye in erect position. Fig. 6 shows the Porro Prism instrument, the most modern and efficient form of terrestrial telescope. The objective and the lenses are in the same relation to each other as was first illustrated in the astronomical telescope, Fig. 1. Two double-reflecting, 45-degree prisms are inserted within the cone of rays between the eye-piece and the objective (Fig. 6); their mission being to erect the image which, in the ordinary refracting telescope, is shown inverted. This system was the invention of the Italian engineer, Porro, who patented it in France about 1890.

The magnifying power of telescopes is usually expressed in diameters and is indicated by the ratio of the focal length of the objective to that of the combination of lenses forming the eye piece. For example, the Lick telescope has a focal length of 50 feet or 672 inches. If, therefore, an eye-piece of one inch focus is used the power of 100 diameters is four 1800 diameters, and eye-pieces of longer shorter focus will give correspondingly lower or higher powers. The practical limit of power in telescopes of the highest degree of accuracy is usually considered to be about 100 diameter per inch of aperture. Thus the 36-inch Lick telescope may be practically used with an eye-piece which would give a power of 3,600 diameters. Such high powers are, however, seldom required and can be used only in the clearest atmosphere. By far the larger proportion of astronomical observations are made with powers of less than 1,000 diameters. In telescope observations, the two elements "power" and "light," while equally important, are always in opposition. Thus an object viewed with

FIG. 4. — Terrestrial Telescope (spy glass).

FIG. 5. — Galilean Telescope (opera glass).
The focus of its own. The red light is refracted, reached its focus in the yellow ray, then the green and yellow points at the centre, sur-
round of green and blue light.

This difficulty in refracting light is called chromatic aberration, checked by a mixture of green and blue light.

This diagram E is a double-convex lens in glass and D a flat-glass lens of nearly spherical form. The difference between them is that a single material in light refraction dispersion, together with the compensating of the two lenses, results in clear and distinct "definition," the image of the star being sharply outlined and colorless. Optical glass is of special manufacture. The D's supply comes from three makers, one in England, France and Germany. The mirror or objective is made of several thin lenses cemented together, usually in number of four in number, alternatively crown and flint glass. Some are using for lenses successfully, though with much difficulty. The mirror or portion in the case of very large discs. The reflecting surface is ground and polished, with great precision, to a parabolic form of the focus required, and then, by a chemical process, coated with silver, which may be easily renewed when tarnished or otherwise injured.

The making of the optical parts of telescopes is a rare art, which, however, has been cultivated with peculiar success in America. Alvan Clark and Sons of Cambridge, Mass., have been exemplified in this connection during the lifetime of the firm, and the SUNY. At the present time the largest reputation as a maker of large telescopes belongs to John A. Brashear of Pittsburgh, Pa.

The telescope tube is usually carried by an equatorial mounting. This form of instrument has its principal or polar axis set parallel to the axis of the earth, its inclination, therefore, corresponding to the latitude of the observatory. At right angles to the polar axis is the declination axis, which, in turn, carries the telescope tube at right angles. Each axis is supplied with a graduated circle, indicating, respectively, the position of the star in hours, minutes and seconds of right ascension, and in degrees, minutes and seconds of declination. It will be evident that when the tube is pointed to a star in any part of the visible heavens, a revolution of the polar axis from east to west, in sidereal time, will make the telescope follow the apparent motion of the star. A driving clock, which is usually located inside the column of the instrument, controls the revolutions of the polar axis so that the star observed remains steadily in the field of vision. The equatorial principle has been applied to photographic telescopes in such manner as to allow the continuous exposure of the photographic plate during the entire night, if desired. One of the most ingenious forms of mounting is the Equatorial Coudé. In this instrument the polar axis is enlarged so as to serve as the main tube of the telescope, the eye-piece being at the upper end where the observer can sit comfortably in his warm room and observe any star in the visible heavens as easily as he uses his microscope.

An elbow is rigidly attached to the lower end of the tube. At the intersection is an accurately polished mirror set at an angle of 45 degrees. At the outer end of the elbow is another mirror, similarly set. The objective is so placed that the light it gathers from the star is reflected by the mirrors through the tube to the eye-piece. The combined movement of the polar axis (the telescope tube) and the objective and mirror carried on the elbow enable the observer to bring into view any star in the visible heavens. The polar axis, with its elbow carrying the objective and revolving in sidereal time by means of a driving clock, follows the apparent motion of the star in the usual way. Two of these instruments are in successful use in the Paris Observatory.

It will be evident that the equatorial telescope, with its various modifications as above described, while giving facility of moving and photographing the heavenly bodies, does not enable the astronomer to determine with required accuracy the positions of the stars and planets. These fine measurements are secured only by special forms of telescopes. The Me-
ridian Circle is one of the most approved instruments for this purpose. From the middle of the tube trunnions extend on either side, carrying finely graduated circles and terminating in accurately ground pivots, which are exactly at right angles to the optical axis of the tube. Two piers are so set as to form a rigid and accurate support for these pivots, east and west, carrying the tube so that the movement of the telescope is in the true meridian only. In the exact focus of the telescope a fixed system of cross-hairs or wires is placed. The best materials for this purpose are taken from the cocoon of the field spider, the web being only one five-thousandths of an inch in diameter. Finely drawn platinum wires are also used. These vertical spider webs are equally spaced and so adjusted that the central wire is exactly in the optical axis of the telescope as measured north and south. Parallel to these central wires there are two movable wires, one horizontal and one vertical, each governed by a micrometer screw. In measuring transits of stars for determining right ascension, or for time, the telescope, by means of the graduated circles, is set to the declination of the star required, and when the star appears, its transit across each of the wires is recorded on a chronograph, by the observer tapping an electric key. In determining declinations, the telescope, by means of the graduated circles, is set to the approximate declination of the star to be observed, and when the star appears at the edge of the field, the observer carefully adjusts the telescope until the star seems to be exactly bisected by the horizontal wire as it threads its way across the field. By reading the fine circle the declination of the star is obtained. Other types of telescopes for similar observations are known as transits, zenith telescopes, mural circles, etc., but the illustrations given will suffice.

Even with all the caution used in the construction of these delicate instruments, errors are sure to develop, due to refraction, flexure of the tube, variation resulting from changes in temperature and other contributing causes, for all of which allowance must be made in the final reduction of the observations. About the middle of the last century Professor Airy, then Astronomer Royal at Greenwich, designed and constructed a vertical telescope, which he believed would eliminate the errors so manifest in his other instruments. He named it the “Refract Zenith Tube.” The principle is shown in Fig. 7. Every part of the instrument is stationary and no part need be touched when in use by the astronomer. The light from the star as it passes the zenith is concentrated by the objective upon a surface of mercury in the base of the column, by which it is reflected back through a hole in the objective; the cone of rays then meets a diagonal prism, is reflected at right angles and enters the eye-piece to be observed as in other instruments. Contrary to the expectation, the Astronomer Royal, from the observed position of the stars were still manifest and the most careful investigations failed to trace them to their source. The instrument was, therefore, discarded. Fifty years later, Professor Chandler, of Cambridge, Mass., discovered that the pole of the earth “wobbles” slightly, causing a variation in latitude. The results of his observations were compared with the Airy observations of a half century before and the supposed errors of the “Refract Zenith Tube” were at once traced to the variation in latitude. The old instrument which had been condemned is thus proved to be correct in theory and practice. It, therefore, re pronounced the latest development in astronomical telescopes, and a large Refract Zenith Tube is in the service of the University of Pennsylvania.

In recent years the mounting of great instruments has passed from the domain of the instrument-maker to that of the engineer, who finds abundant scope for ingenuity and technical expertise in combining very massive and rigid, construction with very delicate means. At the present time the largest telescopes in the world are owned and made in America.

The table on following page gives a list of the larger refracting telescopes in the equator of the more important American observatories.

While the refracting telescope still holds advantages for photographic astronomical work, the tendency of late years has reverted to the reflecting telescope for visual work. Astronomers prefer it because of the much crisper images obtained, due in large part to the absence of the secondary spectrum images formed by the best refractors has turbid quality as compared with the crispness of the reflector. As in the case of the reflecting instruments America leads in the largest reflectors. The largest of all is

The reflecting telescope of the Mount Wilson, Pasadena, Cal., with a clear aperture of 100.4 inches (2,549 meters) and a focal length of 507.5 inches (12,891 meters) can be used directly on the axis of a focal planet. The observations were made in the form of a Cassegrain instrument focal length of 1,060 inches (40,792 mm) as a Coude with focal length of 126,191 inches (76,480 meters). Celestial objects to 53° south declination can be at the principal focus. The telescope after the English fashion, the tube containing the mirror at its swinging between the sides of the axis yoke, which has a bearing at resting on cast-iron pedestals built the main concrete pier below. It was designed by Mr. Pease and other of the observatory staff, assisted by Schwamb of the Massachusetts Institute of Technology. The pier is 33 feet high and forms the intersection of the axes of the ground. Both the declination and tension bearings are composite; in part, and of type, serving to define the axes, remainder carries the load. The load is carried by means of counterweights while the polar axis is supported by means of steel drums built integral axis and floating in cast-iron tanks. It becomes necessary that the total moving weights to 100 tons are constructed of cast and structural and in 1,328,000 as machined as a whole. The larger portion of the mounting, some weighing 10 tons, in Quincy, Mass., and their transposition to Mount Wilson to an elevation of 0.7 feet in diameter, 100 feet high and weighs 730 tons. The rotating portion weighing 300 tons is carried on 28 trucks and is traction driven by two motors at opposite sides. The trucks and rails are carefully machined to conical surfaces to eliminate vibration at the telescope when the dome is moved. The shutter is in halves which open sideways and permit the free viewing of the telescope from the zenith to the horizon. The walls and dome are of double construction and are ventilated at the top to prevent excess heating during the summer. A 10-ton crane is provided to assist in the erection and in the traverse of the various auxiliary sections of the tube.

The second largest reflector in the world is the 72-inch instrument set up in 1918 on Little Saanich Mountain on Vancouver Island, British Columbia, in the Dominion Observatory there. The mirror of this instrument was ground by the John A. Brashear Company of Pittsburgh, from a disc of glass cast in Belgium and shipped out of that country two days before the war broke out. The mirror is parabolic, 13 inches thick at the rim with a hole 104 inches in diameter through its centre. It weighs 4,340 pounds and has a focal length of 30 feet. Observations may be made from the side of the upper part of the tube, from the side at the lower end or through the opening at the centre of the mirror. The telescope with all its fittings weighs 55 tons and is moved by an amount of electric current barely sufficient to light a 16-candle power electric lamp. The mounting was built by Warner and Swasey. The only other telescope of this size in existence is that of Lord Rosse set up upon his estate in Ireland in 1842. It's first mirror was of specu-
lum metal and was replaced by a 72-inch silvered glass mirror in after years. For a long period it was the largest telescope in the world; but was abandoned for optical reasons.

There are three 60-inch reflectors in the Western Hemisphere, the newest one erected at the National Observatory of the Argentine Republic near Cordoba. The mirror was made by the John A. Brashear Company in 1916. In 1904 Harvard University purchased the 60-inch reflector made by Dr. A. A. Common of Ealing, England. This instrument is of the Cassegrainian type and has a rectangular tube. The mounting is peculiar, the telescope being supported in position upon the end of a hollow cylinder which floats in a well or deep basin of water. The cylindrical float is 18 feet long and seven and two-thirds feet in diameter and arranged to float constantly at an angle with the horizon equal to the elevation of the celestial pole at Cambridge—about 45 degrees. The instrument weighs over 20 tons, but is so delicately balanced that it may be moved in any direction with the greatest ease by its electrical controls. The eye-piece of the instrument is detached from the telescope and housed on the second story of an adjacent building, the light from the principal mirror being directed to it by accessory mirrors.

The 60-inch reflector of the Mount Wilson Observatory, constructed by Dr. Ritchey in 1908, was placed in commission in December of that year. The instrument complete weighs 21 1/2 tons, nearly all of which is ingeniously supported upon a float in a basin of mercury, of which it displaces the equivalent of 50 cubic feet, although the entire amount of mercury in the basin is but 635 pounds. The controls are electric and may be manipulated from several stations about the instrument.

Another fine telescope which should be mentioned in this connection is the 48-inch reflector built by Sir Howard Grubb and located at Melbourne, Australia.

For more detailed descriptions of these wonderful instruments and their achievements the files of the astronomical journals are recommended.

Worcester Reed Warner, F.R.A.S.,
Of the Warner and Swasey Company, Cleveland, Ohio.

TELFORD, tel'ford, Thomas, Scottish engineer; b. Eskdale, Dumfriesshire, 9 Aug. 1757; d. Westminster, 2 Sept. 1834. At 14 he was apprenticed to a mason and on the expiration of his time worked as a journeyman at that trade, but subsequently removed to Edinburgh and there applied himself to the study of architecture. In 1782 he went to London, where he was befriended by Sir William Pulteney, through whom he was appointed surveyor of the public works in Shropshire. He now became a civil engineer and in 1793 was entrusted with the construction of the Ellesmere Canal, to connect the Mersey and Severn. In 1803 and 1804 the Parliamentary commissioners for making roads and building bridges in the Highlands of Scotland, and also for making the Caledonian Canal, appointed him their engineer. Under his superintendence 1,200 bridges, two of 150 feet span, were built, and 1,000 miles of new road were made; and under the latter board the Caledonian Canal was constructed.

Under other commissioners he built over harbors, some of which, as at Aberdeen and Dundee, are upon an extensive scale. He also employed in England, superintending the construction of the bridges over the Severn, of eight canals, and the execution of numerous important works for the metropolis.

In 1808 he was employed by the Swedish government to lay out a system of inland navigation through the central parts of Sweden to form a direct communication by water between the North Sea and the Baltic. He built the road between Warsaw and Brest Litovsk in Poland. The greatest monument of his engineering skill is the Menai Suspension Bridge, connecting Caernarvonshire with the island of Anglesea, which was opened on Jan. 26, 1826. In 1828-30 he superintended the drainage of nearly 50,000 acres of the country. He invented the Telford pavior for making roads, and the improvement of which practically any instrument with great precision and sweetness.

TELL, tel', William, Swiss peasant, born in Burglen, near Altorf, celebrated in legend his resistance to the tyranny of the Austrian governor, Gessler. The stories connected him with those relating to the origin of Swiss Confederation, first appear in the 16th century. According to them, Gessler, the rennalous Austrian bailiff of Uri, one of the forest cantons, pushed his insolence so far as to require the Swiss to uncover their heads to his hat (as an emblem of the Austrian sovereignty), and condemned Tell, who refused to comply with this mandate, to shoot an arrow from the head of his own son. The Swiss were successful in his attempt, but confessed that a second arrow, which he bore about his person, was intended, in case he had failed, for punishment of the tyrant, and was, therefore, retained prisoner. While he was crossing Lake of the Four Cantons, or Lake of Lucerne, in the same boat with Gessler, a violent storm threatened the destruction of the skiff, as the most vigorous and skilful helmsman set free, and he conducted the boat safely near the shore, but seized the opportunity of spring upon a rock, pushing off the larch, and had fortunately taken his bow with him, when the governor finally escaped the rescue, and reached a rocky defile on the road to Küssnacht. Tell shot him dead. The death of Gessler was the signal for a most obstinate war between the Swiss and Austrians, which did not bring to a close until 1499. Tell is present at the battle of Morgarten, and is supposed to have lost his life in an inundation of 1350, while attempting to cross the river. Tell is the legendary hero of William Tell. In the Teller family to this day the name is honored.

Investigation has broken down the proofs of this
There is no mention of him by any orantiane historian; his name is first h in the chronicles of the second half 5th century, and none of the Tell ball- of an earlier date. Similar stories to those of the apple occur in rammticus, the Danish historian, and ndic literature, not to mention the old ballad of Adam Bel, Clym of the and Wyllam of Cloudesle. Besides, y the mountains, dates and places, and the widely ; representations of the event, show the development of the legend. The untrr- istry of historical scholars has not been d by the finding of the name of Tell archives and church registers of Uri, and an uninterrupted series of charters relative to the bailiffs or governors of the 14th century, there is no Gess- ing them. The Tell chapels were erected early in the 13th century and mentioned in the document which speaks of the as in 1388 of 114 persons who knew him is, and of the erection at that time of chapel on the shore of the Lake of gene, not known until 1759. Consult 'Recherches Curiées' (1843); Roch 'Tell und Gessler in Sage und Ge' (1877); Gisler's 'Die Tellfrage: Ver- rer Geschichte und Lösung' (1895).

ITZELAND. History.

J. L. CITY, Ind., city in Perry County, Ohio River, 125 miles southwest of In- lish on the Southern Railroad. There are large coal and clay in the vicinity, auarturers include furniture, iron prod- ucts, flour and tobacco. The city named by the Swiss Colonization Society. Pop. 3,869.

J. L. EL AMARNA, Egypt, a district east bank of the Nile, 190 miles above compris ing the site and environs of the city of Akhenaton, known also as Akhet-Aton, built by Amenophis later was known as Akhenaton or Aton. The city was built by Amenophis 1800 BC and was the capital of the empire of thebes after he had abandoned the of Ammon for that of Aton. It grew but was abandoned upon the death of the owner returning to Thebes as and to the worship of Ammon. The important ruins are those of the palace House of Rolls, and there are remains of their. About 300 clay tablets contain records of the time of Amenophis father were discovered in the House 1887. To the northeast and to the f the ruined city are tombs hewn in the hills which abound in sculptured picturing mainly the worship of the Aton.

The tomb of Meri-Ra, high priest of Amun, is in a ravine near the river and the south Consult Petrie, F., 'Tell el-Amarna' Davies, N. C. G., 'Rock Tombs of Amarna' (1903-08); Peake, W. M. F., and Egypt from the Tell el Amarna (1898).

TELL EL KEBIR, Egypt, village in the northeastern portion of the country, on the Sweetwater Canal, 18 miles southeast of Zag- azig. It was the scene 13 Sept. 1882 of a battle between the English forces of Lord Garnet (later Lord Wolsey) and the Egyptians under Arabi Pasha, which resulted in the utter defeat of the Egyptians.

TELLER, tél'ær, Henry Moore, American senator: b. Granger, Allegany County, N. Y., 23 May 1838; d. Denver, Colo., 23 Feb. 1914. He was educated at Alfred University, New York, taught school, and after admission to the bar practised law in Illinois and Colorado. He was United States senator from Colorado 1876-82, Secretary of the Interior 1882-85, and a member of the national Senate from 1885, except for a brief interval 1896-97, up to 1909. He was especially prominent as a silver advocate, and had the unusual experience of serving his constituents as a nominee of the Republican and later of the Democratic party.

TELEZ, tél'yäth, Gabriel Spanish dramatic author, better known by his pseudonym, El Maestro Tirsø de Molina; b. Madrid, between 1570 and 1572; d. Soria, 12 March 1648. He studied at Alcala and remained for some time at Toledo, whence some of his works are dated, also in Galicia and in Seville. The date of his profession as a Brother of Charity is unknown, but we know that he had become superior by 1619. In 1634 he was named De- fensor general of Castile. His first poetical work, 'Los Cigarrales de Toledo' (1624), is a collection of tales in which there is a resemblance of the influence of Boccaccio. This influence is clearer in 'Los tres maridos burla- dos,' which is an admirable adaptation of the 'Decameron.' Instead of a second part of the 'Cigarrales,' promised by the author there appeared in 1635 a new collection ('Deleitar aprovechando') of religious stories mixed with 'Autos,' of which 'El Colmenero divino' is one of the best efforts in religious drama. For a long time Téllez devoted himself to this species of composition. In 1620 he dedicated to his friend Lope de Vega 'La Villana de Vallecas' and four years later he stated that he had written well nigh 300 comedies. He excelled in the religio-theological and historical period and also in historic dramas, farces and comedies d'intrigue. He had a penchant for epigram but was capable of reaching the highest conceptions and frequently sounded tragic depths. Some of his works are equal to Cal- deron's or Lope's best and in recent years critics have begun to do him full justice. An eloquent proof of his merit is that some of his works have been attributed for centuries to Lope or to Calderon of which was the case of 'El Burlador de Sevilla y Convidado de Piedra,' an admirable scenic portrayal of the legend of Don Juan, which, although universal as proved by Farinelli, has taken on the character of a purely Spanish legend through this work of Téllez, which has been widely imitated in other literatures. It is his best work and in order of importance may be mentioned 'La prudencia en la mujer'; 'Marta la piadosa'; 'El vergonzoso en Palacio'; 'Don Gil de las calzas verdes'; 'El amor de los amantes,' and 'La villana de Vallecas.' It has been said that his feminine characters are
lacking in amiable traits. He was to a great extent the model of the stylistic vices of his period and was often imitated by Calderon. It is difficult to comprehend the obscurity into which his works and reputation fell soon after his demise. To-day we possess about 80 of the 400 pieces we know came from his hand. He also wrote numerous lyrical works including: 'Genealogia del Conde de Sástago' (1640); 'La Cronica' of the Brothers of Charity. (See EL BURILEON DE SEVILLA.) The best editions of his works are: those of Augustin Durán, of Hartzenbusch, 'Teatro escogido de Tirso de Molina' (12 vols., 1831-41); by Romános, (1848); and Rivadeniera 'Comedias escogidas de fray Gabriel Téllez.' Consult Cotarelo, C., 'Tirso de Molina: Investigaciones bio-bibliográficas' (Madrid 1883); Morel-Palau, A., 'Etudes sur le théâtre de Tirso de Molina' (in Bulletin hispanique 1900); 'Nueva biblioteca de autores españoles' (Madrid 1906-07); Armesto, 'La leyenda de Don Juan' (ib. 1908).

TELLICHERRY, tel-i-cher'i, or TELLI-
CHERRY, India, a seaport and garrison town in the Malabar district of Madras, 45 miles northwest of Calicut. The main buildings include the castle—now a jail—the North Malabar district court, custom-house, churches and government offices. The entire area, on a picturesque site, covers about five square miles. The principal exports are sandal wood, coffee and cardamoms, spices, cocoa and cocanuts. The factory of the East India Company was founded in 1663. There are missions and other schools; also Brennan College founded in 1862.

TELLURIC, an element discovered by Mueller von Reichenstein (1782) in a specimen of gold ore from Austria. Klapproth named it from the Latin tellus, meaning the earth. Tellurium is most commonly in company with gold, silver, lead and bismuth. Native tellurium is found in considerable quantity in Boulder County, Colo. The other important minerals containing tellurium are sylvanite, calaverite, pelzite, hessite and tetra-
dymite, and were found principally in Austria, and in the United States in California and adjacent States.

Tellurium is a silver-white metal, atomic weight 127.6, melting point about 453° C. and specific gravity 6.25. It is brittle, not changed by exposure to the air and when heated a little above its melting point it boils and condenses again in the cool portion of the retort as metallic drops. In chemical properties it is very like sulphur. It unites with chlorine readily, forming TeCl₂ and TeCl₄. The oxides TeO₂ and TeO₅ are analogous, yet differ considerably from SO₂ and SO₃. Tellurious and telluric acids and the salts derived from them are also known. Tellurium forms a compound with hydrogen, analogous to H₂S and possessing an even more disagreeable odor. This element resembles sulphur in imparting very undesirable properties to metals even when present in very small amount. If tellurium and any of its compounds are introduced into the human system they give the breath a very strong and disagreeable garlic-like odor. To obtain the free element the ore is digested first with sulphuric acid; hydrochloric acid is then added in small quantity and the whole treated with sulphurous acid which precipitates the tellurium as a yellowish compound.

TELFERAGE, tether-áj, or TELPH-
ERAGE, system of aerial transportation, in a cable or elevated railway, by electric power arranged for automatic operation. Both system and the word 'telferage,' as means 'distance carrying,' were introduced by the late Fleming Jenkin. He recognized cases in which the electric motor could be adapted to automatic transportation of materials and he devised a system which when into service gave satisfaction. This consisted of two overhead cables, mounted on stout poles along which light carriers were hauled, each means of one or more electric motors, transmitted current to the motors the cables are cut into sections, adjacent sections of one being insulated from each other, but are converted, with sections of the other cable, to form two continuous conductors, lying alternately on the right and left of the system. The trains were somewhat longer than the sections of cable so that one rested on one conductor while the other was on the second, thus completing the electric circuit.

Modern telferage systems are more elaborate than Jenkin's. As usually constructed, the light steel framework supports a system of elevated cables, from which buckets or cars are suspended, hanging on wheels on the rails. Small electric motors are placed on the carriers. The current is transmitted to the motors by means of a small trolley wire carried over the running cable or rail. Sometimes a double trolley system is adopted. The trolley or towing vehicle is usually equipped with motors. These may be placed on the side of the cable or side by side. The driving wheels are mounted directly on the axles, as gears are not used. The carway is attached to the trolley or to a post and is often fitted with a third motor for balancing the load. Where heavy loads are to be carried two supports may be used, each by one or more running wheels. Where the system is not automatic it is controlled from station or an operator is carried with the car. Where the weights to be transported are light, wire cable is employed, and often the cable is supported between the rollers by a suspension cable. In any case a rail is used stead of a cable when a corner is to be made and in running through buildings where cable construction would be difficult, or when the weight and traffic is sufficient to make the cost.

The advantages claimed for the telferage system are economy in cost of transportation and a capacity for moving large quantities of material with a low cost of operation compared with a railway. Further, they may be erected overhead and out of the way. Telferage systems are now used in many works of all kinds for carrying materials building as well as outside. The system is also adapted to other work, such as excavating trenches, canal construction, etc., (See Clark, Chas. M., 'Telferage,' Trans. American Institute Electrical Engineers (XIX, p. 391).

TELU GU, tel-oo-goo, or TELINGA, lan-
guage of India, belonging to the Dravidian
TEMULAND—TEMPERANCE

I spoken by about 20,000,000 of people in Hyderabad, Mysore, Bombay, Cen-
neces, Burma, Berar and other parts. They are the most numerous branch of the "Indian race", but are less enterprising than the English, who occupy the country to the west. The language is allied in roots and grammar, but differs considerably from the older Indian languages.

See INDIA; TAMIL.

The ULAND, tém'bú-land, South Africa, is the eastern part of the Cape Province, which is situated on the coast of the Indian Ocean, one of the Transkei districts, Pondoland and Griqualand East; and Umtata. Pop. 232,000 (5,179 Euro-

TITLE, tén-os, a sacred plot of land marked off and consecrated to the gods. Any tract of land allotted to a sanctuary.

1SVAR, tém'esh-vár, Hungary, on the Canal, 75 miles northeast of Belgrade. It is a citadel and suburbs — four in all. Noteworthy are the castle, cathedral, and several vineyards. Some of the notable art treasures include wooden goods, oil, acce, leather, etc., and there are grain stores, etc. The fortress has sturdy walls; memorable is that of 1849, when it was invested and bombarded by the international forces. Pop. about 72,500.

2E, tém'pé, Vale of, in Thessaly, Greece, on the Peneus, flanked by the Mount Ossa. It has been immortalized by the poets.

2ERA. See DEISTER; MURAL; PAINTING, TECHNIQUE OF.

PERAMENT, in music, the system of tuning voices or instruments with the rule of fixed tones, adopted since the middle of the 19th century and first advocated by J. Sebastian Bach (1685-1750). In the equal or even temperament, the interval is the mean semitone, that is, half an octave. This neutralizes all harsh discords of uneven temperament, except those that exist among all of the voices or instruments, so that the true intervals become octaves and the key scales 12, the relative pitch levels of the ideal scale being fixed and modulated or tuned in pure or perfect temperament. No further adjustment is necessary, if these tones only are used. Modulation to another key, however, requires that the new tone be so chosen that the original one shall be equal and one or more passing notes vary to arrive at the key desired (see also Temperament). Temperaments are classed as: 1. Well-Tempered (Clavier). Some of the more important temperaments are: 1. Well-Tempered (Clavier), 2. Equal Temperament, 3. Just temperament.

PERANCE. This word has long been the characteristic of the movement for the restriction of the use and sale of alcoholic beverages. The records of all the early peoples of the world contain references to the evils of intoxication. The Buddhists, Taoists and Confucians taught temperance. "Look not upon the wine when it is red nor at the last it biteth like a serpent — and snares like a fisher." (Prov. xxiii, 31-32). The ancient philosophers and founders of the great world religions neither taught nor practised total abstinence and these conditions have not been as widely followed. The temperance movement in America in the 18th century. In 1743 Lord Lonsdale made a speech in the House of Lords, urging the necessity for a temperance reform. The first work of temperance reform was in 1760 Smollett called the attention of the English people to the dangers of "drunkards" and "dead drunk for 2d." He made an urgent appeal for reform in the condition of the low alehouses. Yet it was not until 1829 that record is found of a temperance society in Great Britain, at New Ross, County Wexford, Ireland. In 1830 several temperance societies came into being in English cities and the British and Foreign Temperance Society was founded in 1831. It lasted until 1850, but in the meantime its work was taken up by others. Father Theobald Mathew (q.v.), of Cork, Ireland, began his campaign for temperance about 1838 and within three years he gathered about him more than 4,000,000 followers. The best evidence of the thoroughness of his work is that the consumption of liquors in Ireland fell off one-half during the period of his activity. In 1843 he was called to England and in 1850 to America, where he founded the numerous Father Mathew Total Abstinence Societies. There had been considerable temperance agitation in the States before Father Mathew's arrival. The Washingtonian movement started in Baltimore in 1840 and John B. Gough (q.v.) had begun his wonderful talks for temperance. The influence of Father Mathew was evident in the formation of the Independent Order of Good Templars, founded in 1851 in Utica, and spreading rapidly all over the United States and to foreign countries. A woman's crusade for temperance started about 1870 and crystallized in the National Woman's Christian Temperance Union, founded in Cleveland in 1874 and now having 12,000 local unions throughout the United States. Frances E. Willard (q.v.) who was prominent in the work, founded the world's Woman's Christian Temperance Union in 1883, and it has become the largest and most influential movement for temperance and prohibition. It can scarcely be said, however, that the United States has led in temperance societies. In fact, the number of societies organized, doubtless partly because her territory is so widely distributed. A list of prominent temperance societies in 1905 included United Kingdom 14, Germany 12, Australia 11, Switzerland 11, United States 10,
Temperance agitation has influenced legislation for 75 years, but still the use of intoxicants is tolerated in many communities. As a result temperance agitators have gradually come out stronger and stronger for prohibition of both the manufacture and sale of intoxicants and the temperance movement has merged into the Prohibition movement. The prohibition was the work of the more radical reformers. See Prohibition.

Temperance Legislation.—Legislation against the liquor evil in America dates from 1642, when the colony of Maryland passed a law making drunkenness a misdemeanor, punishable by a fine of 100 pounds of tobacco. As sentiment against intoxication developed, the license system was adopted, as a temperance measure, being popular in communities also because it furnished a revenue for the local government. Soon the license system won the approval of the liquor sellers, for it stopped competition in their business, resulted in uniform prices, and therefore contributed to money-making. Though advanced and introduced by advocates of temperance, the license system was fostered and grew directly through the efforts of the liquor-sellers. Temperance workers then began to advocate no license and a vast amount of legislation developed in the different States over licenses, their revocation or suspension, at the will of the people. Restrictive legislation took the form of local option laws and after the War of 1861-65 the local struggles at the polls of half the cities and towns in the country for years were centered mainly about the question of license or no-license. The establishing of local option in a community had a tendency to drive the lovers of liquor to the neighboring towns where there was license; thus the temperance towns lost their license fees, and saw their churlish citizens going to other places to drink and also to trade. Often the result was that the financial pressure caused a return to license. There was wild license with no-license and no-license almost all over the country. The first State to recognize that this irregular system could be overcome only by the States acting as a unit was Maine, which in 1851, under the influence of the Gough and Mathew movements, adopted State local option, and as a State continued to refuse to license the liquor traffic. Kansas and North and South Dakota followed, and in 1881 Maine placed the prohibitory clause in her constitution and ended the agitation for a return to licensed liquor-selling.

But in other States the contests at the polls continued regularly. Indiana was the first State to pass a local option law in 1832, and several of the States passed such laws before the Civil War. By 1900 one-third of the country was under local option, and in 1911 local option existed by enactment in 33 of the States. Between 1880 and 1910 appears to have been the most active years with States having with little laws to restrict and regulate the liquor traffic. Most of the States passed Sunday closing laws, though allowing the hotels to sell liquor to their customers with meals. There was legislation permitting wives and children of drunks to bring civil suits against any selling liquor to their provider. There were laws locating of saloons within so many churches, schools or polling places. Laws were largely honored in the breach, closing never working effectively in cities, except spasmodically. The chief of police became active. Prohibition opened the back door as was and is (1918) the common practice in large cities. In country towns the selling on Sunday is confined to the men known personally to the proponent. The effort to improve conditions in the evil was equally ineffective. When proposed the argument was that nine out of ten saloons would go out of business, the evil would be confined to those who had the liquor habit and who would drink. This proved to be sophistry. The evil got more money by the high license tax than by the liquor forces to be active in politics, until in very many towns a man could rarely be chosen at all unless he was acceptable to the interests. A perpetual difficulty with obtaining license was the varied methods of evasion by all these various methods of evasion that they failed to strike at the source of the evil, the transportation of liquor. Maine prohibited liquor selling for agents of the United States government, and obtained large sums in revenue from it. Maine, entered into Maine, carried there with it to stop it, by the express companies. A form of nullifying the no-license law was the establishment of liquor agents. This proved to be prohibitory in its effect, because it became apparent to the most obtuse that the manufacture and consumption of liquor in the United States had a slow and steady increase for these years of antagonism, up to 1913, since which date there has been a very slight per capita reduction. The per capita consumption of malt liquors past 100 years in the United States steadily increased up to 1907, after which time there was a decrease. The per capita consumption of distilled liquors has been in decline since 1865. There has been a decrease until 1913, since which time has been justifiable. But this decrease in consumption of distilled liquors was in a change in habits, for the latter grew as the population increased, and the use of hay and other beast feed as a substitute for corn to increase the volume of liquors sold being always on the increase and the falling off then appeared to be due to financial stringency and to moral support to local option or block it, or prevent its enactment or to encourage it. The end of the trade was unharmed.
TEMPERANCE, SONS OF—TEMPERING

Sons of Temperance, or THE OR-der of Sons of Temperance, was founded in the city of New York, in 1842. It is composed of subordinate and national divisions. It has four divisions—one for North America, one for Britain and Ireland and two for Australia. The course of its existence it has had 4,000,000 members on its rolls. Its leading and inalienable principle is total abstinence from all intoxicating liquors and bev-

PERERING, the art of imparting to any means of heat treatment, a definite of hardness. The term is now applied exclusively to certain kinds of steel used in the manufacture of tools. It is the art of hardening and tempering; but this art, if ever really existed, is lost. The effects of thermal changes vary greatly with the quality of the and with the exact nature of the treatment. It is necessary to distinguish clearly between annealing and hardening and tempering. (Except those varieties that are with silicon, tungsten and certain other elements) may be annealed, but it is easy that the steel shall contain a certain amount of carbon, in order that it may be annealed and tempered. If steel to a red heat and is then allowed to cool slowly, it becomes relatively soft, so that an iron and turned in a lathe. This is called "annealing," and it has usually been shown, for example, by the work of Brinell, Tschernoff, Le Chatelier, la, and others that steel which had a dangerous crystalline character when in a slightly oxidizing, that long continued heating at high, have its original structure and as restored by the simple artifice of it, to a certain critical temperature. This temperature is about 1,600° F., and then allowing it the rate of cooling, in this case, being of comparative unimportance. Steels sometimes have which do not need treatment to render them fit for use in certain classes of tools; the tool being ready for use after it has been forged and allowed to cool by natural exposure to the air. In general, however, a tool steel must receive special treatment in order to fit for the work in hand: this treatment being given after the tool has been forged to shape. The process of tempering then consists of two steps, the first of which consists in imparting to the cutting edge of the tool a degree of hardness that is too great for the work for which the tool is to be used, while the second step consists in reducing (or "tempering") this hardness, until it attains a value that experience has shown to be satisfactory. The tempering of an ordinary tool may be described as follows: The finished tool is heated to a bright red, care being taken to have the heat extend back some distance from the cutting edge. The cutting edge of the tool is then immersed in water to a slight depth and kept there until it has cooled sufficiently to remain wet when withdrawn from the water. By this means the steel is rendered exceedingly hard throughout the chilled part; that is, in the vicinity of the cutting edge. If it were used in this condition, however, the edge would be too brittle and would be likely to fail on service. To reduce the hardness to the proper value, the tool, immediately after being withdrawn from the water, is brightened up near the cutting edge with a piece of emery cloth, or in some similar manner, and the cleaned area is then watched while the heat from the unquenched part spreads toward the cutting edge. The oxidation of the steel, as the edge becomes hotter and hotter from conduction, causes a play of color to become visible, which serves as an index of the temperature. These colors run from the hot portion of the tool toward the quenched cutting edge. In the order in which they proceed, they may be described as: pale yellow, straw yellow, brownish yellow, light purple, dark purple and blue. When the proper color reaches the cutting edge, the whole piece is again quenched, and the "tempering" is complete. The colors that are used for different implements are as indicated below:

Very pale yellow (about 430° F.): Steel-engraving tools, turning tools, hammer faces, planer tools, wood-engraving tools.

Straw yellow (about 460° F.): Dies, taps, drills, punches, reamers.

Brown yellow (about 500° F.): Gouges, plane irons, twist drills, cooper tools, wood-boring cutters.

Light purple (about 530° F.): Augurs, surgical instruments, cold chisels, edging cutters.

Dark purple (about 550° F.): Axes, gimlets, needles, hack-saws, screwdrivers, springs, wood-saws.

Some tools are of such a shape that they cannot be tempered in the manner here described, but must have their temper "drawn" to the desired color by reheating the piece between hot iron plates, or in a hot iron ring. Springs are often tempered by a different method, known as "oil tempering." In carrying out this method, the piece is first hardened by heating to a bright red heat and then tempering by plunging the whole piece in water or in oil. The article to be tempered is then wetted with oil and gradually and uniformly heated until the oil upon it blazes up, when the piece is again quenched in the oil. This process of
heating to the ignition point of the oil and then quenching is repeated until it has been performed three times, after which the piece is said to be properly prepared for use.

In the early days of steel-working in the United States, it was common to import water in casks from Sheffield, England, for hardening and tempering purposes, as it was believed that there is some special virtue in the water that had been used for so long, and with such eminent success, in that city. There was probably little or no foundation for this belief, and yet it is known that substances that may be in solution in the water that is used for quenching often have an important influence upon the product. Many artisans dissolve salt or cyanide of potassium in the water that they use for this purpose, and there is considerable ground for the belief that such dissolved substances do exert an influence upon the character of the product, which is out of all apparent proportion to the strength of the solutions containing them. In particular, it may be noted that there is a deeply-rooted belief among blacksmiths and other artisans who work with metals that a piece of iron is improved by heating it and then quenching it in water that contains soap, even in small amounts.

The art of tempering cannot be adequately presented in a short article, and those who are skilled at it maintain (probably quite justifiably) that the only way to learn it is by actual experience in the shop. Different steels may require radically different treatment, and special implements (razors, for example) may call for years of study before they can be tempered satisfactorily.

A LLAN D. RISTEEN.

TEMPEST, The. Although certain internal evidence, notably the verse-test, has caused most scholars to believe that 'The Winter's Tale' was the last of Shakespeare's plays, there will always be reason in thinking that 'The Tempest' (written in 1610 or 1611) best represents the final mood of Shakespeare as he turned from the writing of his plays to the last years of his life in Stratford. It is certainly one of the group of romantic comedies which Shakespeare wrote after the completion of his tragedies; and in the character of Prospero we are warranted in seeing an admixture of Shakespeare's personality as he looked out upon the world from the heights of his later years. He, like Prospero, broke his wand and buried his book deeper than did ever plummet sound. After all, while life may be tragic as presented in the series of plays from 'Hamlet' to 'Timon of Athens,' it is also full of sunshine and humor and the forgiveness of enemies and the reconciliation of the forces of good and evil. 'The Tempest' is such a representation of life. While some of the scenes of the play suggest definitely Milan and Naples, Tunis and the intervening Mediterranean Sea, the enchanted island upon which Prospero is ready for action is as far removed from the uncharted deep that voyagers were braving within the compass of man's imagination. In the grotesque figure of Caliban, the magic of Prospero and the spirit-like world of Ariel, there is the atmosphere of the strange world that stood out in definite contrast with the fixed limits of the European world. More particularly, Shak

in the Bermudas a few weeks after the vessels of the New World, he was indebted to "Stylist's Journals," the discovery of the Bermudas, published Professor Alden has recently made contention that the real source for the story of the storm and for the that take place upon the stra

world. More particularly, Shak

in the Bermudas a few weeks after the vessels of the New World, he was indebted to "Stylist's Journals," the discovery of the Bermudas, published Professor Alden has recently made contention that the real source for the story of the storm and for the that take place upon the stra

Virginia. While, as has been

might have heard from return stories of this wreck and of the

penins in the New World, he was indebted to "Stylist's Journals," the discovery of the Bermudas, published Professor Alden has recently made contention that the real source for the story of the storm and for the that take place upon the stra

found in a letter written by William dated 15 July 1610, and which, published until 1625, was, from evidence, seen by Shakespeare. The between the play and the letter are interesting and certainly tend to show that indebtedness to contemporary sou

in the Bermudas, published Professor Alden has recently made contention that the real source for the story of the storm and for the that take place upon the stra

greater than has been generally supposed. An ideal commonwealth suggested by it while based upon Florio's true Montaigne's essays, a new edition was published in 1610, and resembles to conditions in the Virginia as portrayed in the letter.

However far one may go in the ace of these parallels, the play is none the less creation of Shakespeare's genius, lacking in the perfect technique of s-play, and especially in the closeness of the structure, it is a great poem and itself to allegorical interpretation of the plays. Caliban is a monumental presentation of a primitive type of human being in unrestrained freedom and saturnalia of license. Ariel, more than any other, represents the spiritual forces of nature, the domination of superior will the service of man. Prospero, his magical art and in his intellectual and greatness, is an anticipation of the victory of man at his best over all of the world. There is no greater Shakespeare than the words of Prospero, looking out from the earth which he has reached, expresses the truth about man and the universe:

"We are such stuff

As dreamers are made on, and our little life is rounded with a sleep."

ses, and received a baronetcy. With
he concluded the treaty between Eng-
, and Swedish (February 1668),
view to oblige France to restore her
conquests in the Netherlands. He also at-
tended, as Ambassador Extraordinary, when
peace was concluded between France and Spain
at Aix-la-Chapelle, and subsequently residing
at The Hague as Ambassador, enjoyed the
friendship of De Witt, and also of the Prince
of Orange, afterwards a great figure in the
pital led to the recall of Temple in 1671, who,
refusing to assist in the intended breach
with Holland, retired from public business, and
employed himself in writing his 'Observa-
tions on the United Provinces,' and part of
his 'Miscellanies.' In 1674 Temple was again
Ambassador to the States-General, in order to
negotiate a general pacification. Previously to
its termination in the Treaty of Nimeguen (in
1678), he was instrumental in promoting the
marriage of the Prince of Orange with Mary,
oldest daughter of the Duke of York, which
place in 1677. In 1679 he was recalled
from The Hague, and shortly afterward was
elected to represent the University of Cam-
bridge in Parliament. In 1680 he retired from
public life altogether. He was on friendly
terms with William III who occasionally visited
him. (For his relations with Swift see
SWIFT, JONATHAN). His 'Memoirs' are impor-
tant as regards the history of the times, as are
likewise his 'Letters,' published by Swift after
his death. His 'Miscellanies' consist of essays
on various subjects: 'Gardening,' 'The Cure
of the Gout,' 'Ancient and Modern Learning'
(which provoked much controversy at the
time), 'Health and Long Life,' 'Differ-
ent Conditions of Life and Fortune,' 'Introduction
to the History of England,' 'Poems and
Translations,' etc. Consult Courtenay, 'Life of
Temple' (1836); Macaulay's 'Essay' and For-
ster, 'Life of Swift' (Vol. I, 1875).

TEMPLE, Tex., city in Bell County, on
the Gulf, Colorado and Santa Fe and the Mis-
souri, Kansas and Texas railroads, about 220
miles northwest of Galveston, and 35 miles
southwest of Waco. It was founded in 1882
by the Gulf, Colorado and Santa Fe Railroad,
and was chartered as a city the same year.
It is in an agricultural and stock-raising
region and has considerable manufacture.
The chief manufacturing establishments are
agricultural-implement works, cottonseed-oil
mills and cotton compresses, flour mills,
chewing gum and candy factory and lumber
mills. The city has handsome churches, public and
parish schools, Saint Mary's Academy, two
kindergartens, a business college, three large
hospitals and a public library. The four banks
have a combined capital of $580,000. Pop.
16,993.

TEMPLE, London, England, a district of
the city lying between Fleet Street and the
Thames, and divided by Middle Temple Lane
into the Inner and the Middle Temple, belong-
ing to separate societies (see INNS OF COURT),
each with its hall, library and gardens. The
name is derived from the Knights Templars,
who had their headquarters here. The
Two temples are separated by a wall from
the rest of the city, and have entrance gates
which are closed at night. The district is
occupied, with few exceptions, exclusively by
barristers and solicitors. In former times the
members of the Temple were famous for the
masques, revels and banquets which they gave in their halls. To these entertainments there are many allusions in the old poets; kings attended them, the bakers joined in them and danced. Among the famous members of the Temple have been Beaumont, Sir Walter Raleigh, John Ford, Wyckerley, Congreve, Cowper, Blackstone, Sheridan, Coke, Littleton, Clarendon, Somers and Eldon. Goldsmith was a member here, and here Charles Lamb was born and passed the first seven years of his life.

**TEMPLE**, a name applied in religious history particularly to the temple built by Solomon at Jerusalem as a House of the Lord, and to the temples which succeeded it, more especially the magnificent structure, erected by Herod the Great, which is often mentioned in the New Testament. Solomon's Temple was built with the aid of an architect and skilled workmen from Phoenicia. The temple was an oblong stone building, 60 cubits in length, 20 in width, and 30 cubits in height. On three sides were corridors, rising above each other to the height of three stories, and containing rooms in which were preserved the holy utensils and treasures. The fourth or front side was open, and was ornamented with a portico, 10 cubits in width, supported by two brazen pillars, Jachin and Boaz (stability and strength). The interior was divided into the most holy place or oracle, 20 cubits long, which contained the ark of the covenant, and was separated by a curtain or veil from the sanctuary or holy place, in which were the golden candlesticks, the table of the show-bread, and the altar of incense. The walls of both apartments and the roof and ceiling of the most holy place were overlaid with wood work, skilfully carved. None but the high-priest was permitted to enter the latter, and only the priests devoted to the temple service the former. The temple was surrounded by an inner court, which contained the altar of burnt-offering, the brazen sea and lavers, and such instituted utensils as were used in the sacrifices, which, as well as the prayers, were offered here. Colonnades, with brazen gates, separated this court of the priests from the outer court, which was likewise surrounded by a wall. This temple was destroyed about 586 B.C. by the Assyrians, and after the return from the Babylonish captivity some 70 years later, a second temple of the same form, but much inferior in splendor, was erected. Herod the Great rebuilt it, beginning the work about 20 B.C., of a larger size, surrounding it with four courts, rising above each other like terraces. This being the temple of the time of Christ possesses great interest. The lower court was a square, on three sides surrounded by a double, and on the fourth by a triple row of columns and was called the court of the Gentiles, because individuals of all nations were admitted into it indiscriminately. A high wall separated the court of the women, 135 cubits square, in which the Jewish females assembled to perform their devotions, from the court of the Gentiles. From the court of the women 13 steps led to the court of the temple, which was enclosed by a colonnade, and divided by 12 rows of columns, 4 on each side. The court of the Jewish men and the court of the priests. In the middle of this enclosure stood the temple, of white marble richly gilt, 100 cubits long and 60 cubits high, with a porch 100 cubits and three galleries like the first temple. It resembled in the interior, except that the most holy place was empty, and Herod's temple was double the height of Solomon's. Rooms appropriated for purposes filled the upper story above the inner temple. This edifice was destroyed by the Romans in 70 A.D., and for many centuries the long-consecrated height has been occupied by the Mosque of Omar.

The Egyptians, Greeks, Romans, and other ancient nations had temples to worship of their gods, and the Mexican Peruvians, at the time of the arrival of Spaniards in the New World, had temples. On the sacrificial platform of temples thousands of victims perished. The Greek and Roman temples were, as a rule, models of architectural grandeur and the word "temple" is sometimes, but not always applied to Christian places of worship as a special designation, although frequently used figuratively. The Mormons design the Temple, the largest in the world, in which they worship at Salt Lake City. Consult Gaskell, James, 'The Temple of the Jews' (1878); Smith, G. A., 'Jerusalem' (1908).

**ARCHITECTURE***

**TEMPLE, Order of the.** See (*Royal Temple***.

**TEMPLE BAR**, London, England. The arch on the Fleet street and the Strand, and divides the city from the liberty of Westminster (London). It was a structure of the Cotswold order, designed by Sir C. Wren, and built 1670 of Portland stone. Over the gateway, on each side, were statues of Queen Elizabeth and James I; and on the west side, of Catherine of Braganza and Anne. The heads of persons execute great treason were formerly exhibited on the gate. Here, also, on previous occasions if the corporation of London received the family, the heralds' proclamations, or any distinguished visitors. When the sovereign is in state the lord-mayor here delivered to the sword of state, which he bore after this he rode bareheaded, immense front of the royal procession. As the seriously obstructed a crowded throng there it was removed in 1878, its site now marked by the heraldic monster, a "<".

The gate has been re-erected at Park, Cheshunt.

**TEMPLE UNIVERSITY**, an institution of higher learning founded at Philadelphia, 1884. The first building was the old Temple College, later Temple University in 1917. It was designed by Russell H. Conwell, pastor of the Temple. It was chartered by the Pennsylvania legislature in 1888, and empowered to grant degrees, its name being changed from Temple College University. It offers instruction to young men and women, and academic to the highest university degree. Instruction is arranged in morning, and evening classes in all branches excepting music and dentistry, in which there are day classes. The university is non-sectarian in character.
f a strongly religious atmosphere, and shes a notable work in assisting those who do not otherwise obtain high educa-
vantages. In 1918 there were 321 in-
; 2,192 students attending and 306 with 78.
20 (time), in music, the relative rate or degree of quickness with which music is to be executed. The de-
time are indicated by certain words ento (slow), adagio or largo (leisurely) (walking pace), allegro (gay or quick), rapid), prestissimo (very rapid), etc.
2 is the proper time. (See Music).
'd is also used in chess to indicate the f a move, especially when the move is

ITALY. See ANATOMY;

TEMPORAL POWER (OF THE POPE). A powerful expression, in it is generally recognized, and to a large extent the sovereign civil rule as exercised by the popes over the Church with varying vicissitudes middle of the 8th century down to the 0, when the last remnant of the papal as annexed to the United Kingdom of formal establishment of the temporalates from the year 754, when Pepin, the Franks, bestowed upon Pope 11 (who had sought his aid against the Lombards) independent sov-
over some 20 cities, thus constituting is henceforth known as the state or of Saint Peter. Though apparently at first—possibly unknown for on
of the Pope himself—this addition of ral to the spiritual rule of the bishop was in reality but the natural outcome of existing civil and political conditions. these may be mentioned the fact that itan Church was already in possession of a royal society, or simply as a body ; holding property under the general the empire) possessed not only the neteries now known as the Catacombs, other property, as is clear from the Milan. By a law of 321, the Emperor granted to all persons capable of will the the right to bequeath property to the Church, and himself gave an example in this respect by endowing munif-
se various basilicas of Rome. Similar in one form or another were made by Christians throughout the empire, one incipic uses to which the property thus was applied being to relieve the dis-
ioned by the depredations of the bar-
also began to overrun Italy. Since the
of the 5th century. In this way the Church had become very wealthy, and s were already great landed propri-
ing vast estates in various parts of

Italy and elsewhere long before any form of political papal sovereignty had been thought of. Meanwhile, through the favorable legislation of the Christian emperors, the political role of the popes and of bishops in general, was assum-
ing an ever-growing importance. The bishop of a city was not only the official protector of the poor, of prisoners and of slaves; he had also in virtue of his office a voice concerning various points of civic administration. Even in provincial affairs he enjoyed important rights and privileges. Thus, among other things, we find that appeal could be made from the decision of an imperial magistrate to the tribunal of the bishop. Such being the political status of bishops generally, it is easy to understand that the powers granted to and exercised by the Roman pontiffs were still more extensive. To them, in particular, recourse was had against the exac-
tions of the rapacious Byzantine governors who ruled in the different Italian provinces, and in this connection, as well as in other ways, the vigilant protection of the popes proved benefi-
cial to the people. It must be remembered that during this period the civil and political situation throughout the peninsula was in a condition bordering on the chaotic. The state of unrest and insecurity which resulted from the incursions of the barbarians and the deplorable inefficiency of the imperial adminis-
tration, made the interference of the popes in civil matters a real practical necessity. The Papacy was the only authority that commanded general respect, and the common weal demanded that they should look after the material as well as the spiritual interests of their flock. That such was the true condition of affairs is amply shown forth in the papal correspondence of the time, especially in the letters of Gregory the Great (590-604). It is also worth noting that though they had ever-growing reasons to be dissatisfied with Byzantine rule, the popes (even those who succeeded Gregory) continued to remain faithful to the idea of a world-wide Christian empire, and exercised their influence to maintain in Italy its authority and prestige. But, as is well known, many of the emperors of that period were more preoccupied with theology than with matters pertaining to civil administration, and their repeated attempts to impose upon the bishops of the West subtle formulas of orthodoxy led to frequent conflicts, in some of which popes were violently dragged away to prison or death. Thus Silvester and Vigilius, Pelagius and Martin became the victims of imperial tyranny. On the refusal of Sergius I to accept the decrees of the Emperor Justinian II the latter commanded the proto-
spatharius Zachary to arrest the Pope and bind him a prisoner to Constantinople, but the public spirit in Italy was already in revolt against this arrogant, high-handed policy, and the army interfered to prevent the execution of the imperial mandate. Again, in 727, Leo the Isian sent his edict against the use of images to Pope Gregory II with orders for his deposition in case he should refuse to comply. Gregory re-
ponded by denouncing the edict and excom-
municating the exarch; again the soldiers arose in his defense, and the imperial officials trembled at the prospect of being compelled to carry out their instructions cost them their lives. In 733 the emperor confiscated all the Church's estates in Sicily, Bruttium, Lu-
cania, Calabria and Naples; others were con-
fiscated by the Lombards, and no security remained even for the inhabitants of Rome. The empire was unable to defend its subjects — worse than that, it even oppressed and plundered them. The only refuge left to the Romans and the empire itself was the temporal head of the Franks. It is not clear whether Pope Stephen II in taking this step had already in view the establishment of a civil principality under his own ruler, or not, but that as it may, just then the relations between the papacy and the emperor were further strained by the publication of a fresh edict against the use of images emanating from a synod of Constantino-

A continuation of the old régime seemed no longer possible, the army of Pepin arrived in Italy in the summer of 754, and the independent state of Saint Peter was established, with the Pope as its civil ruler, in the same year. In view of the circumstances, it may be truly said that this distinction was bestowed upon the bishop of Rome in recognition of a twofold prerogative, namely, his prestige as head of the Church and defender of orthodoxy against Eastern aggression, and his character of national protector.

The papal dominion as constituted by the grant of Pepin comprised the cities of Ravena, Rimini, Pesaro, Fano, Casena, Forlì, Comacchio, and 15 other towns. In 1053 the duchy of Benevento was ceded, and for that period and the end of the 13th century the authority of the Roman See was acknowledged by many other free towns in Italy. In 1278 the Emperor Rudolf I confirmed the acquisitions made thus far, defined the boundaries of the papal states, and recognized the Pope's exclusive authority over them by absolving the inhabitants from their oath of allegiance to the empire. The papal dominion then included Perugia, Bologna, Lertinoro, the duchy of Spoleto, the exarchy of Ravenna and the marche of Ancona, but many of the towns were more or less independent. The Romagna was annexed at the end of the 15th century. Under Alexander VI and Julius II were added Faenza, Parma, Emilia, and Venetia, with the papal states receiving their final additions in the 17th century, namely, Urbino, Ronciglione and the duchy of Castro. In 1797 the Romagna was seized by Napoleon and incorporated into the Cisalpine Republic. The following year Rome itself was taken by the French and the papal states were erected into the Roman Republic. Pius VII regained possession of his states in 1800, but they were soon retaken by the French, and finally (1809) incorporated with France, Rome being reckoned the second city of the empire. After the downfall of Napoleon (1814) Pius VII returned to Rome and was formally reinstated in his office of temporal ruler by the treaty of Vienna, mainly through the friendly support of the powers of Russia, Prussia, and England. In 1830 a rebellion broke out in Ancona and Bologna, the reason alleged by the insurgents being that the clerical rule in the provinces contrasted too unfavourably with the preceding French administration. This revolt was quelled through the powers of Austria, Prussia, and England. In 1830 another uprising occurred soon after, and the Austrians took occasion thereby to occupy the northern legations, while at the same time the French placed a garrison in Ancona. Occasional minor disturbances occurred at these events and in 1848, when Pius IX, on the eve of an insurrection, was obliged to flee and Rome was declared a republic. He was again restored to power through the intervention of France, Austria, Siles, and the Austrians occupied legations or Romagna on his return, when their army was withdrawn, the province repudiated its allegiance and Pope and its annexation to Sardinia claimed. The French still continued Rome in subjection to papal authority IX, with a view to withstand any French advances, or the control of papal provinces of Umbria, Urbino, and the Marches in favour of Emmanuel. The Sardinian troops were the aid of the insurgents, and after two French troops having been withdrawn, the war with Prussia, Rome was put to an end without resistance, troops of Victor Emmanuel and the loss of temporal power disappeared. Emmanuel having been proclaimed king of united Italy, took up his residence in the palace of the Quirinal and Pius IX retired from a life of seclusion (in the Vatican) for himself as a prisoner unable to retreat without compromising his head of the Church, or even giving a single man to the cause of the insurrection. The meeting of the present article to appreciate the motives either of those who maintain the independence of the state of affairs has never yet received
nernational ratification. Furthermore, isivity, or even the utility, of such a on is a point concerning which there is ble divergence of opinion even among Catholics. It is a question concerning au thoritative dogmatic pronouncement formu lated by the Church; however, and unmistakable attitude of the popes : cannot be looked upon by Catholics t than deeply significant. All, even the a-montane, must, of course, admit that ssion of a temporal sovereignty is not r tial prerogative of the successor of xer, since for so many centuries before ishablished the Church was able to de-fulfil so efficiently her mission in the Yet this temporal sovereignty is re-y many as the means providentially es-to protect the necessary independence of the free exercise of his func- pondership of the Church. Others, mitting the main principle involved in that the Pope should be free in his cytoky) take a somewhat different the case. They remind us that t the power was the outcome of peculiar ge-tances of the period that it h best and perhaps the only solution at , and for centuries afterward of a problem, partly political, partly reli-it at the same time it is not proved that conditions been otherwise other day papal supremacy just as satisfactory post has developed. But be that as it is claimed that at least in the present d political conditions of the Christian of different from those of the Middle e desired independence in spiritual be can be secured without imposing on the burden of a temporal as well as al sovereignty. When, however, it is w this can be done, no very clear or nry answer is forthcoming. It is plain nature of the case, as well as from the sources—namely the sojourn of t Avignon—that to have the Pope: control or protection of any secular tances in Europe that the temporal he of the head of the Church be not him-independent sovereign, it is hard to a situation in which he would be free lue political or national influence, es-if he is to be either the subject or some temporal ruler. It is for a reason that the founders of the Amer- blic wisely determined that the seat of al or federal government should be ot in any of the States, but in a sepapendent district, exempted from States late, thus insuring greater freedom of the governing body whose duty it is to impor tially in the interests of the en-n. These and other reasons are urged d the 19th century by Frohny, J. W. 'T Italy from 1815 to 1861' (London 1891); Reumont, A. von, 'Geschichte der Stadt Rom' (Berlin 1870); Stillman, W. J., 'The Union of Italy, 1815-1895' (new ed., New York 1909); Tout, F. T., 'The Empire and the Papacy 913-1277' (new ed., London 1891); Vialot, 'La France et le grand schisme d'occident' (Paris 1896-1902).

TEN COMMANDMENTS. See DECALOGUE.

TEN KATE, Jan Jacob Ludewijk, Dutch poet: b. The Hague, 1819; d. 1889. See KATE JAN JACOB LUDEWIJK TEN.

TEN THOUSAND A YEAR, a novel by Samuel C. Warren (q.v.) published in 1847. This story, though highly regarded by critics as "ridiculously exaggerated and liable to the suspicion of being a satire on the middle classes," has held a certain place in fiction for more than half a century. The plot is ingenious, the legal complications are managed in a way that won the admiration of accomplished lawyers and the story with all its faults conduced to arouse and maintain the reader's interest. In 1902 it was reissued in an abridged form as "Tittlebat Timmons."

TENACITY, the property or quality of resistance to disrupting force; the quality by which the molecules of a body resist either tensile or crushing strain. When the tenacity is slight the object may be brittle, when it is great it adheres together firmly. Compare TENACITY See STRAIN. See MATERIALS.

TENAFLY, N. J., borough in Bergen County. 16 miles northwest of New York, on the Erie Railroad. The Happy Land and Bethmore summer outing homes for children are situated here as well as the Mary Fisher Home for the Aged. It is a residential town, forming a suburb of New York, and there are manufactured by factories. Pop. 8,800.

TENAINO, té-nér'ō. See SHAHAPTIAN INDIANS.

TENANCY, a beneficial interest in some form of real property, or the relation of the lessee of land to the lessor of the same. This relation may be established without that the lessee be the holder in fee simple of the reality in question. At the present time the status of a tenant is usually created by a form of conveyance known as a lease; this is now required to be in writing in most jurisdictions. It usually contains conditions or stipulations respecting the use to which the reality may be put, the rent or compensation to be paid the lessor, the making of repairs, etc. The law also regulates the relations of the tenant to his landlord in some important respects. Thus the tenant is protected against eviction by the landlord. The tenancy may be sub-leased unless there is a restriction in this regard in the lease. A surrender or breach of the lease terminates a tenancy. See LANDLORD AND TENANT.

TENANT. See RENT, LAW OF.

TENANT-RIGHT, in British law, a right possessed by the tenant, at the expiration of his tenancy, for reimbursement for improvements, and often of considerate monetary value. It is largely governed in England by statute. Tenant-right prevailed in some parts of Ireland by custom for many years, and was formally incorporated into the law by an act passed in 1870. It is also applied to the preference given to old tenants over strangers in leases from the Church, the Crown or corporations.

TENASSERIM, té-ná'sér-im, India, a maritime division of Burmah, stretching in a north-northeastern direction between the Irrawaddy and the Malay Peninsula, between Siam and the Bay of 36,086 square miles. It is for the most part a mountainous wilderness. Within the region are the Mergui Archipelago, the chief town of the north and Taluvar area, the chief of which is the Burmese Buddhists. The mountains are rich in minerals, chiefly Burmese Buddhists, 1,400,000.

TENCH, a small cyprianid fish (7 garê), familiar in European fresh waters, especially slow-running and muddy rivers. Its color is a greenish olive, tinted with blue; the average length about 12 inches. Flesh is soft and rather insipid.

TENDA PASS, or COL I, Italy, a pass of the Maritime Alps, Italy, a pass of the Maritime Alps, the province of Cuneo, between the towns of Limone, on the carriage road and Sommet Cuneo. Its highest point is 6,195 sea-level.

TENDER, in law, a formal offer of a tenancy in a tenancy, or of an agent, or of a tenancy in common actually produced. Making a tender is the effect of freeing the defender from frequent expenses if the tender is accepted. A tender made to one of several joint owners is held as made to all. A legal tender of money of the country, originally limited to coin, but extended to authorized instruments. A payment in foreign notes or dollars, or a large sum in bronze or not a legal tender.

TENDON, or SINN, a band fibrous tissues by which a muscle is connected to a bone or other hard part. Tendons are composed of elastic strands or layers, more or less elongated, very much flattened and membranous, called aponeuroses or tendons. They glide smoothly in sheaths, especially in extensor movements; in some cases many are in a single sheath, in other situations kept in place by an annular ligament, the bead, and the blow. The Achilles tendon is a tendon of the most beautiful contrivances in the body, the manner in which the flexors or tendons in the fingers stop middle phalanx and divide to allow the deep flexors to pass through the extensor tendons to the phalanx, thus securing counteraction of shape, with freedom and motion. Contractions of tendons are benefited by subcutaneous tenotomy, (q.v.) and is also benefited by the division of the tendons of the sternomastoid muscles. Tendons of tendons, or the cause of an affection usually due to strain or sprain. Rest and mild counter irritation are the principal elements in the treatment of a strain of a tendon, less than a strain. When a tendon is cut nature makes an effort to grow or depositing new tissue in tendons. See TENDONS.

TENDRAC. See TANRE.

TENEBRAE, in the Roman Church the term used to signify the Thursday and Friday of Holy We
TENEDOS—TENEMENT HOUSE

TENEDOS, tên-đōs, Asia Minor, an island in the Aegean Sea, off the Troas Coast, near Turkey. It lies at the entrance to Dardanelles, hence has figured in naval strategy on several occasions. It is six miles three miles wide, is of volcanic formation, rugged surface, but highly fertile, cultivated for its wine. Pop. 5,000.

TENEMENT HOUSE, a multiple dwelling for the occupation of several families, each of which can live independently of the cooking within its apartment. The definition varies somewhat in different localities. In New York, Philadelphia, Washington, and other cities, it is such a house as two families. In Chicago, Boston, and other large cities, the line is drawn at more than four families. Tenement house is a generic term for what are popularly called apartment houses and flat houses or flats, as well as tenements. The attempt has sometimes been made to distinguish between apartment houses and tenements, but the two are so closely related that it is difficult to draw a clear line. Tenement houses are usually built in blocks, with a central alley, and are usually five or six stories high. They are usually built of brick, and are usually six to twelve families in each building. The first story is usually a storefront, and the upper stories are tenements. The tenements are usually divided into apartments, each of which is rented to a family. The apartments are usually small, and are usually furnished with a bed, a table, and a few chairs. The kitchens are usually small, and are usually shared by several families. The plumbing is usually poor, and the sanitary facilities are usually inadequate. The windows are usually small, and the light is usually inadequate. The ventilation is usually poor, and the air is usually polluted. The walls are usually thin, and the noise is usually excessive. The stairs are usually narrow, and the distance between them is usually inadequate. The stairs are usually narrow, and the distance between them is usually inadequate. The stairs are usually narrow, and the distance between them is usually inadequate. The stairs are usually narrow, and the distance between them is usually inadequate. The stairs are usually narrow, and the distance between them is usually inadequate. The stairs are usually narrow, and the distance between them is usually inadequate.

History.—The movement for tenement-house reform in the United States naturally began in New York, its largest city, where the need for regulation first became apparent, and may be said to date from 1842, when Dr. John H. Griscom, the city inspector of the board of health, called attention to tenement conditions in a special report on the sanitation of the city. It has since extended to almost all large cities in which tenement houses have been erected, and has taken the form sometimes of State law, as in New York and Massachusetts, or more often of city ordinance, as in Chicago and Philadelphia. The legislation in New York is the result of the investigations and recommendations of the committee of the New York State legislature, with the scope of inquiry of the New York State commission, which is typical, has been to make a careful examination into the tenement houses in cities of the first class; their condition as to the construction, healthfulness, safety, and conditions existing in tenement houses; and to report the condition of tenement houses and all phases of the so-called tenement-house question in those cities that can affect the public welfare.

Fire Protection.—Protection against fire is almost universal. Structural provisions directed to this end are contained in the building laws of all cities. In New York, Philadelphia, San Francisco, Jersey City, Providence, Syracuse and Nashville, all tenements must have fire escapes. All tenements over two stories in height must have fire escapes in Saint Louis, Baltimore, Louisville, Minneapolis, Saint Paul, Denver, Toledo and Columbus. In Chicago, Cleveland and Cincinnati, there must be a rule of one entrance to tenements over three stories in height. In many cities tenements must be fire-proof throughout when over a certain height. In Philadelphia this is true of all tenement houses; in Washington, of those over five stories; in New York, Buffalo, Louisville, Minneapolis and Denver of those over six stories in height. In Boston the limit is 65 feet.

Light and Ventilation are protected by minimum open spaces and by a limitation of the percentage of a lot which can be occupied by a building. In Philadelphia there must be open spaces at the side or rear, equal to one-fifth of the lot area, and the minimum width of all spaces must be eight feet. In Buffalo, under the local law in force before the general State act of 1901 was passed, the minimum width of any outer court was six feet in two-story buildings, eight feet in three- and four-story buildings and one additional foot in width for each additional story. The minimum interior court was 8 by 10. In Boston, a clear opening at the rear must be left equal to one-half the

Great Britain this movement has been to all kinds of houses, including tenement houses, and is usually called by the title of "Housing Reform." The initiation of the movement has been benevolent impulses, but the strong forces behind it which have given impulse to that initiative and have united to carry the movement forward have been the same which have evolved sanitary and building regulations and are founded quite as much on self-interest as altruism.

Fire Protection.—Protection against fire is almost universal. Structural provisions directed to this end are contained in the building laws of all cities. In New York, Philadelphia, San Francisco, Jersey City, Providence, Syracuse and Nashville, all tenements must have fire escapes. All tenements over two stories in height must have fire escapes in Saint Louis, Baltimore, Louisville, Minneapolis, Saint Paul, Denver, Toledo and Columbus. 1 Great Britain this movement has been to all kinds of houses, including tenement houses, and is usually called by the title of "Housing Reform."
width of the street on which the tenement fronts and there must be two open spaces at least 10 feet wide. In some cities the required court area is expressed in square feet, without reference to minimum width or length, and increases proportionately with the height of the building. This principle is adopted in New York, where the minimum width of exterior courts in buildings five stories high is 6 feet on the lot line and 12 feet between wings and the minimum area of interior courts on the lot line in buildings of the same height is 12 by 24. These dimensions are increased or decreased according as the building is higher or lower. Tenement houses in New York must have an open yard at least 12 feet wide in the rear. The maximum percentage of lot area which may be occupied by the building differs, properly, according as the lot is an interior one or a corner lot. As respects interior lots, this limitation in New York is 50 per cent; in Boston 65 per cent; in Philadelphia 80 per cent. The height of rooms is almost universally regulated, the minimum usually being eight feet. The height of tenements is limited in many cities. In New York it is limited to one and one-half times the width of the street on which it faces.

Water Supply.—In New York water must be furnished on each floor. In Philadelphia and Buffalo, on each floor, for each set of rooms. In Boston, Chicago, Jersey City and Kansas City, in one or more places in the house or yard. Water-closet accommodation is very generally prescribed. In Philadelphia and in New York, under the law of 1901, there must be one for every apartment. Under the previous law in New York, there must be one for every two families. In other cities the unit is the number of persons. It is 20 persons in Boston, Baltimore and Denver; 10 persons in Rochester.

Law Enforcement.—The enforcement of Tenement-House Law in American cities is usually vested in existing city departments to which it is most germane. These provisions, which relate to the construction of new buildings, are not in themselves enforced by a building department or by whatever part of a city government has charge of the enforcement of building regulations. Sanitary regulations are, for a like reason, usually enforced by a board of health or by whatever city officer supervises the enforcement of health laws in general. In the city of New York previous to 1901 the enforcement of such regulations was divided between the building department, the health department, the fire department and the board of health. Under such divided responsibility many of them were not enforced at all, and the enforcement of others was extremely lax. Moreover, the tenement-house problem in New York was an exceptionally large one. Of its population at that time of nearly 3,500,000, nearly 2,500,000, or more than two-thirds, lived in tenement houses as legally defined. Under these circumstances the State commission of 1900 recommended the establishment of a separate tenement department in the city of New York. This department was established under the new charter of the city which went into operation in 1902 and centres in itself all the municipal duties toward tenement houses and their such, which were previously divided among other city departments.

Model Tenements.—The erection of tenements, sound and beautiful, is primarily philanthropic, has been frequent in the United States than in Britain. The best known and earliest "Home Buildings" and "Tower Buildings" were erected by Alfred T. White, on the first named in 1879. Tower Buildings, which have been financially successful from the start, was an epoch in tenement reform. It led indirectly to the Tenement-House Law of 1879. Among successful model tenements are the City and Suburban Homes Company of New York. In the United States 610 cities are an active interest in housing, and in housing enterprises have been launched.

Great Britain's great movement towards reform in Great Britain has led to what different direction from its counterpart. The evils there have largely slum conditions than those from tall buildings and unventilated lighted rooms. The problem of tenement practically exist only in London and Glasgow. Consequently English and French effort has been directed mainly to the removal of unsanitary areas and the erection of new buildings. The city governments themselves, movements, at first local, and authorized local acts, such as the Glasgow Improvement Act of 1866 and the Liverpool Sanitary Improvement Act of 1868, have been made by the city governments themselves. The Housing of the Working Classes Act 1890 and many slum areas have been and municipal tenements built in these notably in the cities of London, Chester, Liverpool and Edinburgh.

House Regulation in Great Britain is essentially the same general subjects and follows the same general lines as American regulation. Limitations as to height are general and more drastic in America. Such houses are limited to 40 feet, and may not exceed the distance between the front wall of the building and the side of the street in streets less than 30 feet wide. In Edinburgh they are limited to 40 feet, and one-quarter times the width of the street. In Liverpool and Glasgow to the actual width of the street; in Manchester to two-stories of less than 30 feet in width, three stories in wider streets up to 36 feet. Tenement regulations on the tenant usually form part of the granting regulations. The regulations for Berlin are very elaborate, but proceed on the same general lines as in English American cities. In Berlin, houses fronting on the street may only be as high as 1 4 times the street. In Paris somewhat similar plans are in operation.

No American city has imitated the example of building municipal tenements, and has such active house department as is seen in Berlin. Serious objections to any such sphere of municipal activity would discourage and restrict.
prise, which has proved sufficient: demand. The problem is too large for a man to deal with it successfully. Use of any amount of public funds would not at its disposal. In any case, the only way to prevent private would only increase the evil which: remedied.

TENNESSEE, tén-né-sé ('The Volunteer State'), a southern-central State of the United States. Kentucky and Virginia lie to the north; North Carolina to the east; Georgia, Alabama and Mississippi to the south; and Arkansas and Missouri to the west. Its length on the northern side is 436 miles; that on the southern side is 100 miles less. The area is approximately 42,050 square miles, of which something like 300 miles are covered by the water of streams. The southern boundary of Tennessee was intended to follow the 35th parallel, but all parts of it lie from a fraction of a mile to a mile south of that line, excepting the 45 miles east of Tennessee River, between Alabama and Tennessee. That part of the northern boundary between Tennessee and Mississippi Rivers is on the parallel of 36° 30'. Immediately east of Tennessee River, the northern boundary is 12% miles north of parallel 36° 30'. Eastward from this point the boundary is not straight but on the whole approaches that line, coming within approximately five miles of it, in the middle of Claiborne County. Here there is a jog of about a mile to the north. There is a similar but somewhat greater one in
the eastern part of Sullivan County. It was the intention to make the crest of the Great Smoky or Unaka Mountains the eastern boundary between Tennessee and North Carolina. The range extends into Johnson County, and is approximately 81° 41' 4½" W. longitude. The western boundary is the middle of the Mississippi River as the channel ran in 1763, at the time of a treaty between the British and French. The most western point is in Shelby County, and is approximately 90° 28' W. longitude.

Surface Features.—Tennessee has eight well-defined natural divisions: (1) On its eastern borders rises in great ridge-like masses and treeless domes the main axis of the Appalachian chain, the loftiest peaks of which reach an elevation of 6,600 feet above the sea. Many beautiful valleys and coves nestle amid this grand range of mountains, which is known as the Unaka or Smoky Mountains, and which has an area, approximately, of 2,000 square miles. (2) Adjoining these mountains on the west is the second natural division, called the Valley of East Tennessee, which lies between the mountains and the Cumberland Mountains on the northwest. This valley has a fluted bottom, made up of a succession of minor ridges and valleys with a northeast-southwest trend. Viewed from the mountains on either side, these minor ridges and valleys melt into a common plain. This valley has an area of 9,200 square miles and is of great agricultural value. It is the southwestward extension of Shenandoah Valley of Virginia. (3) Next in order, going westward, is the Cumberland Plateau, which rises 2,000 feet and more above the sea, and 1,000 feet above the last-mentioned division. It forms a bold escarpment, on its eastern edge presenting a gray, rocky, formidable rampart. Its western edge is irregular and jagged, notched and scalloped by re-entrant coves and valleys which are separated by finger-like spurs, pointing for the most part in a northwesterly direction. Most of the northern part of the plateau is cut by deep, narrow ravines, between which are sharp-topped ridges. The southern half is divided lengthwise into two parts by the deep-cut Sequatchie Valley. The area of this division is 5,100 square miles. (4) Resting against the western edge of the Cumberland tableland and including the elevations bordering the Tennessee River in its return across the State are the Highlands, or Rimlands, having an average elevation of 900 feet above the sea. For the most part this division is a flat plain fruited by numerous ravines traversed by streams. Its area is 9,300 square miles and it surrounds, in an irregular circle, the next division. (5) Surrounded by these Highlands lies the Central Basin, elliptical in shape, with an area of 5,450 square miles. It is the agricultural region in the State, and is on an average of 300 feet lower than the Highlands that border it. (6) The valley of the Tennessee River comes next on the west. Its surface is broken and irregular. It stretches from south to north on both sides of Tennessee River. It has an average width of 12 miles and an elevation of 350 feet. Its area is approximately 1,300 square miles. (7) The slope of West Tennessee constitutes the seventh natural division and differs from all the other divisions mentioned in having but few hard occurring in a narrow belt north and bordering the Tennessee River, that with the except slope gradually toward the the most part, the surface is gravelly in places is furrowed with lowing streams that flow in slugs the Mississippi. Its area is 8,280 with an average elevation of abruptly terminates in a line of bluffs looks the great alluvial plain or b of the Mississippi River, next to be (8) The Mississippi Bottoms is eight and last of the natural divisions. It is a low, flat plain, studded and originally clothed with dark forest of its area lies below the high v Mississippi, and as a result there swamps and marshes. The area of is 950 square miles, and its ele sea is 300 feet.

A very singular topographic feature is referred to as Sequatchie Valley, a deep trough extending from a point on the south boundary of the Southern tableland into two unequal arms, the being known as Walden's Ridge. has its head near the middle between and southern boundaries of is about 60 miles long and from miles wide. It is enclosed by approximately 1,000 feet high, and centre flows the beautiful Sequatchie. The highest point in the State is Mount Guyot, which is near the Cocke and Sevier counties, and which 6,636 feet above sea-level. Other exceed 6,000 feet are Mount Henry Mountain, Clingmans Dome, High Knob, Le Conte, Mount Curtis, Mount & Master Knob. They all, with few are on or near the line that separates from North Carolina. There are a few near the eastern border of the Plateau which rise above 3,000 feet.

The Alleghany range of Pennsylvania Virginia becomes the Cumberland Tennessee, and Sand Mountain in the Blue Ridge of Pennsylvania. Virginia North Carolina takes the name of Smoky Mountains in Tennessee. long, straight valleys of Tennessee lying between the and overlooked by them are rich, beautiful — centres of industry, into a diversified system of agriculture. State altogether it will be seen that raphy is greatly diversified. The on the east are offset by the fact that the Missippisppi on the west are three great plateaus and two fruitful valleys, all differing in soils, climate and products. It is State of the greatest variety in number of 20 miles wide next to 25, 1 and the Cumberland form the principal basins of the State. The Yellowstone is tributaries of which in turn flows into the Missouri all the streams which drain the except a few insignificant ones

mall area next to the Georgia line, way through the Mississippi into the exotico. Of all the streams in the Tennessee river system, this section, i.e., from Carthage, Tenn., to Burnside, Ky., has good steamboat passenger service for six months of winter and spring. On this navigable stretch may be seen the old Indian town site and the old burial cairns at the mouth of Caney Fork, rugged Sand Shoals, Seven Sisters (a stretch of seven towering cliffs in Clay County, Tenn.), the Natural Bridge near Burksville, Ky., the historic battlefield of Fishing Creek, where the Confederate General, Zollicoffer, lost his life. It is a quaint river. Nearly every one of its beautiful scenic reaches has its legendary story. This portion of the navigable river above Carthage reaches that interesting mountain and highland section, the home of the moonshiners. It is like stepping back into the language, thought and customs of the 18th century.

The Cumberland is navigable from Burksville, Pulaski County, Ky., to its mouth, a distance of 518 miles, for about six months in the year, for boats of three feet draft, and for gasoline boats drawing one foot. From Lock 21 to Burnside, Ky., a distance of about 20 miles, it is navigable the year round. In 1908 the Federal government completed a series of seven locks and dams which rendered the river navigable for the entire year from Nash-ville, Tenn., to Carthage, Tenn., a distance of 120 miles, and since 1914 has locked and dammed the entire stretch from Nashville to the mouth of the river, a distance of 193 miles. The traffic on Cumberland River for year 1914 was 467,486 tons, value, $9,023,206. This consisted principally of corn, wheat, livestock, general merchandise, lumber, logs, sand and gravel.

The Mississippi River supplies approximately to the State 200 miles of navigation. The Holston, French Broad, Clinch, Elk and Duck rivers, all tributaries of the Tennessee, are floatable in high tide for logs and flatboats for many miles, though rarely navigable for steamboats. Obey's River, and Caney Fork, tributaries of the Cumberland, and the Ohio, Forked Deer, the Hatchie, tributaries of the Mississippi River, are navigable for 20 miles or more at high tides. Tennessee has approximately 1,200 miles of navigable waters. See also Water Power Resources of Tennessee in this article.

Geology.—Contrary to the popular opinion, all the rocks of Tennessee that show at the surface are of sedimentary origin, excepting some in three small areas near the North Carolina line, in the northeastern part of the State, which are of igneous origin. Being of sedimentary origin, they are in layers or beds, and consist of sandstones, conglomerates or pudding stones, limestones, shales, silt and clay bands. In the Smoky Mountains and the valley of East Tennessee, these beds by the slow but enormous pressure that has been brought to bear upon them from the southeast have had their original horizontal position replaced by great folds that extend in a northeast-southwest direction. Though this pressure was slow, at times and in places it was exerted so fast that the rock beds could not adjust themselves to it by bending, but instead snapped along lines parallel with the folds, thus producing on the southeast side, little by little, to be shoved.
up on those of the opposite side. Thus layers that originally were hundreds or in places even thousands of feet apart vertically now rest with their broken edges in contact with each other. Such displacements are known as faults, and there are many of them in the Great Valley of East Tennessee scores of miles long. Indeed some of them run the whole length of the valley, and into the other States at either end. It is this folding and faulting that gives direction to the Great Smoky Mountains themselves, to the valley of East Tennessee and the ridges and minor valleys within it, and to the escarpment of Cumberland Plateau.

The general lay of the rock beds beneath the Cumberland Plateau is that of a syncline or trough, with gradually sloping sides, but this simplicity of structure is broken in the south half by a pronounced arched or anticlinial structure. It is along this arch that Sequatchie River has carved out the valley of the same name.

The general lay of the rocks beneath and bordering the Tennessee Valley is that of an elliptical flat dome with its highest part in the centre of Rutherford County. The direction of the major axis of this dome is northwest-southeast, or roughly parallel with the folds of East Tennessee. This is the direction of Cumberland Plateau. The sides do not slope uniformly, but are billyow. This dome is the counterpart of a similar one in Kentucky and adjoining territory in southwestern Ohio and southeastern Indiana. In the southeastern corner of Stewart County there is a small structural dome upon which a depression, known as Wells Creek Basin, some two miles wide, has been excavated by the same natural processes that formed the Central Basin. The rock layers on the sides of this dome stand at a much higher angle than those beneath the Central Basin, of which it otherwise is a miniature duplication. The lay of the hard rock beds in West Tennessee, which are far beneath the surface, is not known, but they probably dip at a low angle to the west, as do the unhardened beds of sand and clay, above them.

The oldest rocks of the State are of Archearing Age, and occupy three small areas along the border in Johnson, Carter and Union counties. They include several formations, and consist, for the most part, of quartz, schist and granite. The remainder of the Great Smoky Mountains is composed of rocks of Cambrian Age of which there are several formations. They consist of sandstones, quartzites, conglomerates, limestones, shales and slates. Without the disturbance that has affected the region, these rocks would be overlain in the valley of East Tennessee by the younger Ordovician ones, but the folding, faulting and denudation the area has suffered has in places brought these to the surface in long, narrow belts and smaller irregular patches. Of the Ordovician formations in East Tennessee there are several, the oldest being the upper part of the Knox dolomite, a formation that in places exceeds 3,000 feet in thickness. Above it comes the Sandstone Age, like the Cambrian rocks, and for the same reason, those of Ordovician Age in the valley of East Tennessee lie for the most part in narrow, northwest belts. Because of the Sequatchie arching and the denudation upon it, rocks of Ordovician Age are exposed in the floor of the valley as they are in that of the Central Basin, and for the same reasons. The East Tennessee are limestone, marble, shale, while those in the Central Basin include 12 formations, are nearly all sandstone. The Knox dolomite nowhere attains surface in the Central Basin, but owing to a long uplift and probably to reduction in the of the overlying formations, it does occur in the Wells Creek Basin. Limestone of Silurian occurs in narrow belts in the valley of Tennessee, along the eastern escarpment of Cumberland Plateau, on the western, the Central Basin, along the streams through the western part of the Highland and along Tennessee River. Black shales of Devonian Age, known as the Chattanooga, overlies the Silurian limestone of the same distribution, except that it occurs in the northern, eastern and southern border of Central Basin. The rocks of theassic and the top of the oldest plateau are of Mississippian Age and consist of chert, shale and limestone. Those of the upper part of the Cumberland Plateau are Pennsylvanian Age and are composed of sandstone, conglomerate and coal beds.

West of the Tennessee, most of the formations are unconsolidated sand and clay. The lowest and oldest is of Cretaceous. Of these there are four formations, which crop in north-south belts, within 30 miles of the Tennessee. Westward from the Central Basin, the surface formations are of Eocene Age, with the exception of the loess on the alluvium bordering the streams. The loess, which covers a belt of 30 mile wide at the Mississippian bluffs, is of Pleistocene age; the latter is Recent. The thickness of the deposits and Eocene beds is not known, well reported to be 2,000 feet deep on the ceilings at Red River. The geological history of Tennessee that of all other land areas, is one of changed conditions. At times the place was land. At other times it was sea. At still others it was both land and sea. During the Cambrian times, the area was probably all land excepting the part covered by the sea. During the Ordovician times, the sea covered the entire area of the state. During the Devonian and Silurian times, there were many changes that brought more or less of the sea, now above the sea, now on the land. During the Triassic and Jurassic seas, the area was probably all land excepting the part covered by the sea. During the Cretaceous times, the area was probably all land excepting the part covered by the sea. During the Tertiary and Quaternary seas, the area was probably all land excepting the part covered by the sea. Since Eocene times, none of the state was submerged, excepting possibly the west for only a part of the time. Mineral Resources.—Tennessee
TENNESSEE 419

On some of the high ridges are found balsam and spruce and at lower elevations black, red and post oak. The slope type consists largely of chestnut, oak, white, black, post oak and hickory. There is also to be found some loblolly pine, sour wood and black gum. The cove type represents the heaviest growth and greatest variety. Topography and soil both favoring. Here is found yellow poplar, basswood, magnolias and black walnut. In addition chestnut, white oak, beech, sugar maple, hemlock, red oak and hickory, together with a sprinkling of black birch, bittersweet, locust, ash, buckeye, sour wood, elm, cherry, sassafras and sycamore. Certain coves contain many of the above species and others few. Forest fires prior to 1907 were very destructive but are not to be compared to those of the Northwest. The necessary brevity of this article leaves much of interest unsaid.

Game.—In the early days Middle Tennessee was termed by the Indians the "Happy Hunting Grounds." Until some years after the war the whole State was blessed with an abundance of game of many species, deer, bear, wild turkey, grouse and quail. Among the migratory birds, ducks, geese, snipe and wood pigeons were found in great numbers during the winter and spring months. By the year 1900, however, conditions had been so changed through the activities of market hunters, "game hogs" and game dealers that it was difficult to find game sufficient to afford any sport. This fact impressed upon conservationists the necessity of some law to prevent extermination. The first general Game Law (chap. 169, Acts 1903) met with violent opposition in the general assembly and passed by a narrow margin. The act to protect non-game birds (chap. 118, Acts 1903) was also passed at this session. The benefits of the Game Law, however, were speedily made so manifest that by 1905 the legislature created the Department of Game, Fish and Forestry (chap. 455, Acts 1905) and added to the law of 1903 many important features (chap. 515, Acts 1905). By 1907 game had greatly increased. A close season on deer was established and several hundred deer in a private park near Nashville were purchased and freed. They soon scattered and under protection have greatly increased. Public sentiment now secured the passage of the first general Fish Law (chap. 451, Acts 1907) and Forestry Law (chap. 397, Acts 1907). Both of these measures had been "side-tracked" in the preceding legislature. In 1909 an attempt was made to legislate the State warden out of office. The Supreme Court declared the measure unconstitutional (14 Cates, 45). In 1915 another like effort was made and again the Supreme Court sustained the incumbent of the office (Howser v. Fulton). Tennessee is cursed with factional politics. Redfoot Lake, now the property of the State, can be made one of the finest game and fish preserves in the country. It has long been an El Dorado for hunters and fishermen. Public sentiment now strongly favors game and fish laws. It is necessary for their enforcement. Without this public sentiment back of it, the law is typically a "dead letter." With the establishment and operation of the game farm, the outlook for game in Tennessee is encouraging.

Fish.—Few States in the Union have as numerous streams so well adapted for fish as
TENNESSEE

Tennessee. Many flowing into the rivers are fed by cold springs and are unexcelled for bass, trout, land-locked salmon and perch. Prior to the movement in 1903 for the protection of game and fish, little attention was given this valuable asset. Seining was frequent and discriminating not uncommon. Little attention was ever paid to local laws. It was not until 1907 that the general Fish Law was passed (chap. 469, Acts 1907). This law was sought to be amended in 1915 (chap. 152, Acts 1915) and the State Warden also removed from office. The Supreme Court held this could not be done, but did not pass upon the other features of the bill.

It has been a hard struggle to protect fish in Tennessee. The people have not been educated to the need of their protection. The fine waters, and particularly Reelfoot Lake, should supply fish food in greatest abundance at reasonable costs and out of season, like the English sparrow, has been a great misfortune. Eradication of either seems impossible. There has also been a decrease of fish from the pollution of streams. This is a common act, but most uncivilized practice. The agencies at work are known to be inadequate. The development of manufacturing industries with no restrictions upon disposal of waste is fast ruining many fine streams and the fish have become unattainable from the tainted of the water. The mountain streams of the eastern division, where the population is not sufficient to cause damage by sewage, are often affected by sawdust. Seining, dynamiting and pollution are combining to destroy the fish of the State. Drastic measures must be adopted. It is feasible to keep wastes out of the waters and it is possible to turn them into profit through valuable by-products. A campaign of education as well as law is essential to accomplish the needed results.

Soils.—The soils of the Great Smoky Mountains are mostly rich clays and loams. Those of the valley of East Tennessee are mainly red to brown clay and loam that are very productive, though there are narrow belts disturbed by extreme alterations that are porous. Those of the Cumberland Plateau are in parts sandy and in others clayey. The former are not productive and should never be cleared; the latter are not strong, but are susceptible of great improvement. Those of the Highland Rim are in parts fairly good, in others poor, but all can be improved and brought to a high state of cultivation. Those of the Central Basin are very productive clays and loams, and most of the area is in a high state of cultivation. The soils of the western slope vary from those that are sandy and of little worth, through loams and clays that are fairly good and susceptible of great improvement to the rich loess area near the Mississippi, and the rich though narrow alluvial bottoms of the Mississippi, Tennessee and smaller streams.

Agriculture.—The area of Tennessee is 42,022 square miles, or 26,912,000 acres of which 21,000,000 are farm lands and more than one-half of this area is improved. The principal crops and stock are corn, rice, wheat, and cotton, leading in importance in the order named. Clover, timothy, soy beans, cow-herd's grass, lespedeza, vetch and alfalfa grown for hay.

The production of strawberries and totoes has become one of the spring feasts especially in Gibson and adjoining counties. From these and other points vast quantities of vegetables and fruits are shipped to the New York markets. The entire State offers ideal conditions necessary to successful fruit culture. Stock raising is an important industry. Hogs are an important product. Poultry raising is extensive, and dairying is generally followed near the larger cities and towns.

Stock raising in all its branches is generally followed, but this industry is far short of possibilities. Some advantages the stock raises enjoys in this State are an agreeable climate, a high price for products, and a market in which the demand is always in excess of supply. In short, as a stock-raising center Tennessee has no superior and but few equals among the States of this Union. The grass section of the State has bred some of the finest roofing and the finest harness in the world.

Agricultural Department.—The office of the commissioner of agriculture of Tennessee was established in 1871. It was then housed in the old state capitol. The present building was completed in 1874 and is the Federal office building.

The Agricultural Department has been steadily increasing in importance and has become of supreme importance to the State view of the fact that a population of 2,000,000, 80 per cent are farmers and planters more than ever before have become interested in scientific farming and farming not as a means of livelihood but as a proper business.

The soils of Tennessee are well adapted to diversified farming and respond bountifully to modern methods. In fact, as an all-round agricultural state, Tennessee is unequaled in any other region in the United States in the variety, profusion, character and quality of its farm products. Wonderful possibilities exist in the soils, climate, physical structure and drainage of the agricultural areas, and frequent demonstrations of great crops are reported to the Agricultural Department from the three grand divisions of the State, as the result of applications for crops and results, sometimes on the richest and most modest of intensive methods applied in the preparation of the land and the cultivation of the crops, exemplifying the versatility and capacity of such lands and the progress of their development.

There are three assistant commissioners of agriculture, who hold office by appointment of the commissioner, and whose work is in his direction. The appropriations by the General Assembly for the salaries and expenses of the various offices under the commissioner's direction for the fiscal year 1918 approximate $35,000.

Scientific farming is making rapid strides in Tennessee, and the State's splendid citizens have become fully awakened to the truth that "co-operation is essential to success." The
TENNESSEE

...nstrated at the farmers' institutes, meeting held annually in each three grand divisions of the State—Tennessee in May, West Tennessee in Sep-

... it are cut yearly.

...e of products, the flour-mill and grist-

...try stands but little below that of

...and timber products. The soil and

...itions of wheat and corn; but this in-

...ses not depend upon local supplies of

...rial; for much wheat and corn are

...into Tennessee mills from the West

...Northwest, and the milling in transit

...erried for many years by Nashville.

...ville's largest milling center, has tended

...ate this industry and place it upon a

... and stable basis.

...manufacturing industries of Ten-

...the industries are found in

...machine-shop products; printing and

...; cars and general shop construction

...rs by steam railroad companies; oil,

...d and coke; iron and steel blast fur-

...naces; textiles, and a very large list of other

...industries aggregating 4,775 establishments in

...1914 and covering almost all articles manufac-

...ured to meet the ordinary demands of modern life.

...The summary of the manufactures of Ten-

...ee for 1914, prepared by the Bureau of

...ensus, gives the following statistics: Number

...of establishments, 4,775; persons engaged in

...manufactures, 38,514; proprietors and firm

...members, 5,142; salaried employees, 8,999;

...age-earners (average number employed dur-

...ing the year), 74,373; primary horse power,

...365,857; capital, $211,423,000; services, $44,910-

...00 (including salaries $11,828,000, wages $33,

...022,000); materials, $123,430,000; value of prod-

...ucts, $212,071,000; value added by manufac-

...ure (value of products less cost of materials),

...86,641,000.

...This summary shows a consistent increase in

...the census report of 1914 as compared with

...that of 1909. In the order of their importance,

...from a percentage point of view, the increases

...for the several items named are as follows:

...Salaries, 28.8 per cent; payments in goods,

...materials, 18.7 per cent; primary horse power,

...8.4 per cent; value of products, 17.7 per cent;

...wages, 17.1 per cent; value added by manufac-

...ure, 16.3 per cent. It must be borne in mind

...that the United States Census with reference

...to manufactures excludes hand trades, building

...trades and neighborhood industries and takes

...account only of establishments conducted under

...the factory system. Furthermore, they cover

...only establishments having annual products

...valued at more than $500. The four large cities

...of the State, Nashville, Memphis, Chattanooga

...and Knoxville, have more than one-fourth of

...he total establishments of the State. In these

...cities are most of the very large manufacturing

...enterprises, such as the following in Nashville:

...Milling, printing, car-shop construction, stoves

...ranges, fertilizer, tobacco and lumber. In

... Memphis lumber and allied wood-working

...industries, industries connected with cotton, par-

...icularly cottonseed oil mills, molasses mills.

...In Chattanooga iron and steel manufactures,

...hosiery mills, knitting mills, wood-working

...plants. In Knoxville marble enterprises, wood-

...working establishments, knitting mills.

...Speaking generally, the outlook for manufac-

...tures in Tennessee is exceedingly encour-

...aging, and it is likely that in the years to come

...this State will be a very large manufacturing

...State. This result will be brought about largely

...by two causes, cheap hydro-electric power and

...proximity to great natural resources.

...Transportation.—Growing out of the agita-

...tion for internal improvements about the

...year 1830, the State undertook with enthusiasm

...promotion of railroad development. The South

...Carolina Railroad, chartered in 1828, the

...construction of which began in 1829, doubtless fur-

...ished an impulse to the movement. The desire

...was for an outlet to some southern port for

...the products of agriculture and industry. The

...first railroad chartered in the State was the

...Memphis Railroad Company, a proposed line

...from Memphis to Pulaski, on 12 Dec. 1831.

...The line was never built. In 1836 the Hiwassee

...Railroad was chartered and completed in 1837,

...probably the first work ever done on a

...railroad in the State. This line now forms a

...part of the Southern Railway between Knox-

...ville and Chattanooga and was completed in
1856. In 1845 the Nashville and Chattanooga Railroad Company was chartered and the track between Nashville and Chattanooga was finished in 1856. This was a complete line of railroad operated in the State. In 1845 a great commercial convention was held at Memphis, over which John C. Calhoun presided, out of which grew the Memphis and Charleston Railroad, now a part of the Southern Railway.

The steam railroad mileage of the State for the fiscal year ended 30 June 1914, exclusive of switching and terminal companies, was 4,105.55, or 1.63 per cent of the total mileage of the United States. The State had 985 miles of line for each hundred square miles of territory and 18.42 miles of line for each 10,000 inhabitants. In 1870, with 1,492 miles, it ranked 12th in its proportion to the total mileage. In 1914 its standing in this respect was 29th, while as to mileage on the basis of territory it was 28th and on population 38th. Prior to the Constitutional Convention of 1870, the State gave large aid to railroad development and up to the Civil War period, had issued bonds for that purpose amounting to approximately $15,000,000.

For the calendar year 1914 the State levied taxes against 39 railroad corporations, having an assessed value of distributable and localized property of $80,782,245, upon which the tax for State purposes alone was $317,755.40. Excluding the special excise taxes of the government, the railroads in the State pay in annual taxes approximately $448 per mile of road. The six railroads in the State operating or controlling more than 50 miles of line, and which embrace about three-fourths of the total mileage, are as follows: Louisville and Nashville Railroad Company, 1,888 miles, including the Nashville, Chattanooga and Saint Louis Railway, with 989 miles; the Southern Railway Company, 945 miles, including the Mobile and Ohio Railroad Company with 119 miles, and the Virginia Southwestern Railway with 101 miles; the Illinois Central Railroad Company miles; the Tennessee Central Railroad Company, with 294 miles; the Cintra Orleans and Texas Pacific with 143 miles, and the Carolina, Chat and Ohio Railroad with 35 miles. The rates of the State are equitable and the railroads have a maximum rate of two and a half cents.

For the most part, the railroads are an unusual degree in the development resources along their lines. The street railway mileage in the State was 309.9, and had an assessed value of $14,607,308.99.

The Water-Power Resources of Tennessee

To state in definite figures the water which can and ultimately will be obtained from the rivers of Tennessee is a possibility. Any comprehensive water-power development must, for location, ignore political boundaries. For this reason it is not possible to segregate the power resources of one State from the neighboring States. Further, the quantity of power to be obtained from any given stream is wholly a question of the possible storage of water in reservoir construction of which forms an essential part of the water-power development. The evolution of reservoirs is itself complex, involving questions of vested rights, the cultural value of lands to be flooded, the location of railroads which are already established and as to the rendering of great many other attractive water-power projects impracticable. Further, other questions of a nature no less vital to the estimate of power potential in a single river.

Such figures, therefore, as may be presented are to be regarded merely as approximate estimates, and the following tables have been compiled with great care from all the available data, must be so interpreted.

**Summary of the Water Power Available for Development, Without Storage, Within Tennessee. Minimum Horse Power During the Six High-Water Months.**

**T**otal available for two hundred of the time

*The United States Geological Survey concludes, 12,000,000 horse power of the Tennessee River from Chattanooga to Nashville, but the above statement would not permit of the development of this power. A report of the chief engineer of the United States army, 20,000 horse power, or 140,000 horse power for the entire river system, is not considered as realistic. In miles the river is 300 miles from Knoxville to Nashville.

*1. A September, 1913, the small water power of the State capable of being developed by individual enterprise is estimated to be 50,000 horse power. The writer estimates the total power of the resource of Tennessee, from the report of the Chief Engineer of the United States army, 20,000 horse power, or 140,000 horse power for the entire river system, is not considered as realistic. In miles the river is 300 miles from Knoxville to Nashville.*
TENNESSEE

The total amount of power which a company can produce, even with the cheap coal, will render available 100 per cent more than double the above estimate.

The development of the State in the future will necessarily depend on the construction of additional power plants. The Power Company has consented to supply power to Caney Fork, and to the Cumberland River. The Company's new power plant at Caney Fork, near Greenville, will furnish power to the Nashville Railway and Light Company and other railroads in the neighborhood.

The Tennessee Power Company has already completed within the State the third water-power plant, to develop power on the Tennessee River. The Company's new power plant at Caney Fork, near Greenville, will furnish power to the Nashville Railway and Light Company and other railroads in the neighborhood.

The Tennessee Power Company has consented to supply power to Caney Fork, and to the Cumberland River. The Company's new power plant at Caney Fork, near Greenville, will furnish power to the Nashville Railway and Light Company and other railroads in the neighborhood.

The estimated value of property owned by the State in 1883 was $1,579,475; estimated value in 1914, $5,316,378.

Sources of Revenue.—Taxes on polls, on property, on incomes, on sales of land, on exercise of privileges, on litigations, from fines and forfeitures, from merchants, from peddlers, and from collateral inheritance tax. All taxes must be uniform.

Exemptions.—One thousand dollars, personal property of each resident taxpayer; United States, State, and municipal property not used for rental; religious, charitable, scientific, literary and educational property, subject to certain minor limitations; agricultural and mechanical associations worth less than $10,000; all public thoroughfares and parks dedicated to public use; all growing crops, direct product of the soil.

Banks and Banking.—The following figures largely exhibit the condition of banks in Tennessee in March 1910:

Tennessee has a modern banking law. The State banks are regarded with exceptional con-
TENNESSEE

fidence by the public. It is optional with the State banks to assume double liability of stockholders. The State under its constitution cannot become the owner in whole or in part of any bank.

Government.—The separation of the powers of government into legislative, executive and judicial departments was specifically recognized in 1796. The State under its constitution, also, without mentioning it, so organizes the government. Under the 1776 constitution the legislature elected the governor, who was given no veto power until 1870. Until 1853 the judges of the principal courts were elected by the legislature. Not until after 1834 were the justices of the peace elected by the people. The North Carolina and early Tennessee courts adopted with little hesitation the doctrine of judicial review of legislation. The power of the legislature has been made subject to gradually increasing limitations, both procedural and relating to the variety and scope of its enactments. In 1870 the reaction against the arbitrary acts of the reconstruction governors resulted in the decrease of the powers accorded the governor.

The constitution of Tennessee has reflected its economic and social history. The simple agricultural commonwealths of the 18th century, after securing the people against the encroachments upon their "rights" which had become so frequent under royal governors, demanded only an outline of the frame of government and a few other elementary provisions such as the regulation of the suffrage. The power of the land speculators showed itself clearly in the requirement of a specific land tax in 1796. The enthusiasm for internal improvements was apparent in the constitution of 1834; reaction against its abuse, and against prevalent careless methods of dealing with corporations, in the constitution of 1870. The relative decline of agriculture and the vast increase of mining and manufacturing interests, as well as the trend of population city-ward furnish the economic background for a new convention.

Education.—The present school system controlled by a State board of education; the denominational schools and colleges, the private preparatory schools and the several city systems constitute the means of education. Educational upbuilding has been marked since 1872, which is the time of the beginning of the three chief agencies within the State, namely: (1) The system of public schools, inaugurated by the State legislature; (2) The establishment of George Peabody College for Teachers by the Peabody Board of Trust, and (3) The founding of Vanderbilt University. The general growth of education has been from the eastern boundary of the State toward the west. Of the three grand divisions — East, Middle, West — East Tennessee has had the highest and most general development, while Middle Tennessee is second and West Tennessee the lowest.

Public Schools.—The University of Tennessee is the head of the public school system with all departments located at Knoxville, except the medical and dental colleges which are at Memphis. The department of agriculture maintains jointly with the United States Department of Agriculture and the State department of agriculture, an extension division which takes to every county experts of every kind needed for farm development. Farm demonstration agents are employed in the counties receiving this service. Support is received from the Morrill Act Fund of 1890; the Nelson Fund, Act of 1907; the Land Grant Fund, Act of 1862; the Hatch Fund, Act of 1887; the Adams Fund, Act of 1906, and from the appropriations of the State constitution. The annual expenditure is from $350,000 to $400,000. An attendance of 1,000 students is maintained beyond that of the Summer School of the South which annually registers 1,500 attendance. Control of the university is centered in a board of trustees appointed by the governor, one from each Congressional district of the State.

The State board of education has under its direction the normal schools, the high schools and elementary schools through the officers of instruction. This board is appointed by the governor and consists of nine members, with the stipulation that not more than three members shall be from any one grand division of the State. The offices filled by the State superintendent of public instruction are: State high school inspector, presidents of the normal schools, teachers of the normal schools, supervisors of elementary schools, conductors of teachers' institutes and the examiners of teachers' examination papers. Other duties of the board are: Examine teachers under a uniform State law; examine applicants for the position of county superintendent of schools; apportion the school fund as outlined by law; adopt schoolbooks, both elementary and high school; outline all courses of study; certificate all teachers, county superintendents and graduates of the elementary and high schools, and to issue such regulations as may be needed under legal provisions in the general supervision of the public school system.

The school fund is derived from county levies, which vary in amount, and are collected by the county treasurers. However, one and one-half mills on the dollar of assessed property is mandatory for all counties through a State enactment. Also, the general education fund established in 1909 provides that 33 1/3 per cent of the gross revenues of the State be expended for school purposes, same to be divided as follows: 61 per cent for elementary school; 13 per cent for county superintendents; 10 per cent for county supervisors, consolidated schools, industrial work, salaries of county superintendents; 6 per cent to county high schools; 2 per cent to the Cookeville Polytechnic Institute; 13 per cent to normal schools; 7 per cent to the State University. A poll tax of $2 supplements this fund. The aggregate fund is approximately $8,000,000 — apportioned by the State Board of Education to a school population of 780,000 with 12,000 teachers whose average salary is $50 per month for a term of 130 days. Four normal schools are maintained, one of which is for negroes — with an annual total enrollment of 2,500. Seventy-one counties out of 96 have county high schools with an enrollment of 12,500.

The Roman Catholic Church maintains 2 parochial schools, with 4,170 pupils, one college for boys with 350 students, five academies for
th 619 pupils, two orphan asylums with
ians, making a total of 5,464 young peo-
people under Catholic care out of a Catholic
on of 19,000.

The famous Webb School in Knoxville is the pioneer of college prepa-
schools in the territory southwest of the
Ohio. Others of the same type whose
purpose is to train boys for college are

Institute.—The following in
is receive their support from the State:
entral Hospital for Insane located near
le; the Western Hospital for Insane
Bolivar; the Eastern Hospital for
located at Bearden; the Reformatory
ys located near Natchez; the Tennessee
School located near Nashville; messeer Confederate Soldiers’ Home at
age; three of the larger counties in

Tennessee have their own industrial schools,
namely, Shelby, Knox and Hamilton.

Throughout the State are a great many
stitutions which derive their support through
ditional contributions from individuals,
through societies organized for that purpose,
such as the Masonic Home located near Nash
ville, the Odd Fellows Home at Clarksville
the Old Woman’s Home at Nashville. Many counties in the State maintain charity
stitutions such as county asylums, poor
ghouses. The State has also in the past given
aid to private institutions such as the Ten
essee Children’s Home, Finding Society
nd the School for Blind Girls.

Penal Institutions.—Penal institutions are
the penitentiary, or State prison, to which per
sons convicted of felonies are sentenced; and
county jails used for the detention of persons
 awaiting trial, or those who have been convicted
of felony and are temporarily to be con
veyed to the penitentiary. Sentences for
terms less than one year are to the county
d, and persons fined by the criminal courts
and failing to pay such fines are also im
prisoned therein. Under the law a county jail
may be declared to be a workhouse in which
the prisoners may be worked on the highways
during the term of their sentences, or
until their fines shall be paid according to a
schedule of valuation placed upon their labor.
The cities also have workhouses for the
punishment of infractions of city ordinances
authorized by State law. Workhouse prisoners
may be transferred from one county to an
other, and hence the labor of prisoners from
several counties may be applied to highways in
one county together, an arrangement due to
the fact that in most counties there are very
few county prisoners.

The penitentiary, or State prison, was es
lished under an act passed in 1822, and be
gan to receive prisoners in 1831. It was con
ducted under the direct management of the
State until 1870, except when held by the
United States military forces from 1862 to 1865,
and except when under an abortive lease in
1867. From 1870 to 1867 the lease system
was in force, although the State at the same
time employed a superintendent, wardens and
physicians, to look after the interests of the
prisoners and State, as well as could be done
under the system.

The act of 1893 provided for a change to
the State account system, with a provision
permitting the hiring out of a part of the con
victs at the main prison under contracts for
labor by the day; also for the purchase of
farm and coal lands. A farm of 1,100 acres,
lying in a large bend of the river six miles
below Nashville, was bought and a commodious
modern prison was erected thereon. Later
2,400 acres were added to this prison farm.
For coal mining purposes the State purchased
the Brushy Mountain tract of 12,000 acres in
Morgan and Anderson counties, and later pur
chased "Herbert Domain" of 10,000 acres in
Bledsoe and partly in Cumberland, White
and Van Buren counties. This latter tract is
supposed to contain good coal, but it has not been
opened. In the same act the State is forbid
ned to mine by convict labor except in the
State’s mine. A large number of convicts are
employed at Brushy Mountain, the number on 1 Dec. 1914 being 616, while those in the main prison were 1,243; total, 1,859. White convicts were 651, colored 1,208. Females 62, all at Nashville.

At the main prison two-thirds of the convicts are employed in manufacture, blacksmithing, carpentry, and domestic work, etc., under direct workgangs; the remainder are similarly employed on contracts with outside parties, but all are kept under the eye of trusted State officials to see that the humane provisions of the law are carried out.

During 1915-16 200 convicts were hired to Campbell County, and 50 to Williamson, and employed in working on public roads at 10 cents an hour. This new departure seems to be successful; there is a strong movement so to employ the mass of the convicts in the future.

The Indeterminate Sentence Law is in force.

In 1915 an act was passed creating the Board of Control, with its office at Nashville, whereby the several public institutions of the State Reformatory, the Tennessee Industrial School, asylums for the insane, deaf, dumb and blind schools, are brought under one board for their better and more uniform management. The statistics of the operations of this board have not been issued for 1915-16.

For a number of years following 1897, when the new system for the prison went into effect, profits over expenses were large, often running over $200,000 net profits a year, but in more recent years the receipts have not much exceeded expenses.

While the convicts were employed under the lease system and many of them confined in the old prison which was, from 1887 to 1897, within the city limits of Nashville, the death rate was very high, being at times over 3 per cent; the report to the end of 1914 shows a death rate of 9.3 per cent.

There are two institutions which are penal in character, the Tennessee Reformatory for Boys and the Tennessee Industrial School. The reformatory is in a different part of Davidson County from the main prison, but is in a way connected with it, and to it are committed young convicts with a view to reformation.

The Criminal Courts may send any convict under 18 years of age to this reformatory, and nearly all such are so disposed of. The population of the reformatory is 497.

The industrial school is designed for the care of young persons who are without the care of guardians or provident parents and such as are found wandering or loitering in company of evil repute. The pupils or inmates of the industrial school, number 890. Several different counties maintain institutions of the same kind, and they are recognized by the courts. The discipline is of great value, and there are many pupils who have not been placed in the school by reason of any complaint against them.

The act of 1911 establishes the Juvenile Court and divides young offenders and unfortunates into two main classes, namely, delinquent and dependent. Delinquents are those who have committed some penal offense, while dependents are such as have been mentioned herein in connection with the industrial school.

The cities are divided into districts, each having a district or juvenile court, but in nearly all the counties this position is assigned to the judge or chairman of the County Court. No person under the age of 16 years can now be tried and sentenced, in the first instance, to the penitentiary, but it being the duty of the judge of the Criminal Court whenever a person of such age is indicted to turn such youth over to the Juvenile Court. The Juvenile Court shall send him to the reformatory, industrial school, or other institution of the kind, or may commit him to the care of a guardian, for a definite period; and shall retain supervision until the youth shall be of age.

The person accused has free legal counsel, and his parents may defend him. If the youth prove totally incorrigible, after due effort at reform, he may be tried later as any other criminal and sentenced to prison. By the act of 1915 capital punishment was abolished.

**Archaeology.**

**Eolithic and palaeolithic Man.**—Where and when man first appeared on this continent, and how he came into the section now known as Tennessee is still undecided. It is claimed, and also denied, that remains of man of same geological age and culture as that of the earliest and rudest of eolithic and palaeolithic man at Europe have been found in several sections of the United States, but no well-authenticated finds of such have been made in Tennessee. If eolithic or palaeolithic man ever existed on this continent, the caverns and rock-shelters of the Cumberland and Tennessee valleys offered ideal places for their abodes. These were about the right distance below the great ice fields—which reached to the Ohio River, at or near the end of the last great ice age—offered practically the same climate and shelter in which eolithic and palaeolithic man were found in Europe.

**The Mound Builders.**—Formerly it was believed that the ancient mounds and fortifications of this section were built by a long-vanished race of people, of lighter complexion and different from the Indians. This belief originated from some of the early Indians telling the whites that the Indians did not build the mounds, but they were built by an earlier white race, which the Indians conquered and exterminated. Modern research has proved this to be untrue. It is now well established that these great earthworks were built by Indians.

The contents of these mounds, and the manner in which they were placed therein, are of the same nature as those of the ancient races among the whites. The mounds were found in connection with the mounds, for seats for their religious houses, and for the residences of their chief men. Scattered along the larger water courses of Tennessee are probably ancient mounds. Each mound is usually accompanied by a village site and hundreds of ancient graves. These remains are of various different ages and show somewhat different artifacts and customs. It is probably true that...

that date it has taken an active and leading part in all the wars in which the country has been engaged. In the War of 1812 she furnished 28,000 troops and had double the number that any other State in the battle of New Orleans, fought by General Jackson—one of her sons—on the 8 Jan. 1815, in which the British commander, General Packenham, was killed. In the several Indian wars east of the Mississippi in the States of Florida, Georgia, Alabama and Tennessee, furnished nearly all of the soldiers engaged, as well as the commanding officers—Jackson, Houston, Coffee and Carroll. The happy ending of these wars gave peace and security to life and property to the people of these States against the torch, tomahawk and scalping knife of the cruel, treacherous and relentless savage. The principal battles in these Indian wars were Tallahatchee, Tuscaloosa, Emucktaun, Etowah, and Oconee, on the Tallapoosa River, and the decisive battle of the Horseshoe, which ended the Creek War— their noted chief and leader, Red Eagle, being captured.

The next link in her military history is the five years of the Mexican War, from 1846 to 1848. Under the terms of the Treaty of Guadalupe Hidalgo, she was entitled to 10 regiments of foot and 3 of horse, and she furnished 5 regiments of foot and 1 of horse. In the war with Mexico she furnished 10,000 troops, and in the three years of the Mexican War, 1846, 1847 and 1848, furnished 12,000 soldiers. In the war with Mexico she furnished 10,000 troops, and in the three years of the Mexican War, 1846, 1847 and 1848, furnished 12,000 soldiers. In the war with Mexico she furnished 10,000 troops, and in the three years of the Mexican War, 1846, 1847 and 1848, furnished 12,000 soldiers.

In the War with Germany in 1917-18 the State's gross quota was 25,515; enlistment credits totaled 25,515; draftees enlisted, 11,899; the net quota, 14,525. The number of registrants under the Selective Service Law was 188,946, of whom 54,827 were called for examination. Of these 15,909 were accepted, making the ratio to those called for examination 31.02 per cent. There were 34,069 colored registrants, of whom 7,940 were called for examination and 2,666 were accepted. The aliens from Entente countries, who registered, numbered 794; 73 were from neutral states; 44 were alien enemies.

State Formation.—The State of Tennessee was formed out of the western half of North Carolina. The first white men of whom we have any account to set foot on Tennessee soil were De Soto and his band of adventurers, in 1541. In 1662 La Salle built a fort which he called Prudhomme, where Memphis now stands. Fort Loudon on the Little Tennessee River, 30 miles below Knoxville, was built and occupied by the British in 1756. In 1760 it was surrendered to the Indians, who destroyed it and destroyed the British claims to the Tennessee land. It was called The Watoga Settlement. In 1771 Parker and Carter set up a store to trade with the Indians where Rogersville now is. This was called The Carter Settlement. The next year Jacob Brown established the Cumberland Road. In a short time many settlers built cabins around these stores. Another settlement was made on the Holston River, which soon became an important centre. These pioneers, being far from the mother State, without government, and without protection, in 1772 organized themselves into the Watoga Association, the purpose of which was to protect themselves and to dispense justice among the colonists. The leaders were John Sevier and James Robertson. The Watoga Association more soldiers during our Civil War than any other Southern State, North Carolina furnishing a few thousand more to the armies of the South than she did.

She furnished active service 1 lieutenant-colonel, 9 major-generals, 33 brigadier-generals and 153 colonels, with lieutenant-colonels and majors in proportion. She had nine general officers killed in battle to wit: Zollicoffer, Hatton, Smith, Tyler, Strahl, Carter, McCloud, Adair and Kcranet. She furnished nearly all of the soldiers engaged, as well as the commanding officers—Jackson, Houston, Coffee and Carroll.

The semi-military organizations of bison and chapters had their origin in Nashville. The celebrated Ku Klux Klan (q.v.), which worked for peace and security, not only for her own people, but for the entire South, also originated in one of her towns—Pulaski—in the county of Giles.

To show to what extent Tennessee was the theatre of active hostilities from 1861 to 1865, the general government maintains seven cemeteries in the State, in which 42,000 Federal soldiers are buried.
The foundation of the Commonwealth of Tennessee by Andrew W. B. Jones, and the independence of the United States, formed a great and trying test of the valor and patriotism of the people. The Tennessee of 1776 was a country in which the war had been waged for several years. The British and the American forces were in constant冲突 with each other. The people were divided in their opinions, and the government was weak and inefficient. The Tennessee of 1776 was a country in which the war had been waged for several years. Carolina could in fact be extended to them. The insurrectionary state of Franklin adopted the constitution which North Carolina had framed on declaring its independence in 1776. After the cession of North Carolina's western possessions to the United States, the organic law of the land was the act of Congress for the government of the Territory Northwest of the River Ohio, made applicable to the Southwest Territory by a separate act.

With this experience in constitution-making and having before them the newly-adopted Constitution of the United States, the people of Tennessee sent their representatives to a convention at Knoxville in 1796 to form the constitution under which they were to live as a State of the Union so soon as Congress should recognize their demand for Statehood. Like the North Carolina constitution, it was adopted in committee and not submitted to popular vote. William Blount, governor of the Southwest Territory, was president of the convention and Andrew Jackson, a member, is said to have suggested that the name of the new State should be Tennessee.

The constitution of 1796 remained unchanged until 1834 when another convention, with William B. Carter as chairman, met in response to a genuine popular demand for alterations that would bring the constitution in accord with growth of the State and the spirit of the times. A new instrument was drawn up and submitted for adoption to the electorate as established by it.

Amendments were adopted in 1835 and 1865 and in 1869 a convention to meet the following year was called by the legislature. John C. Brown was made president by the convention. In 1897 a proposal by the legislature to hold another election was disapproved by the voters and in 1904 a number of amendments submitted by the legislature were likewise rejected.

Aside from the inevitable constitutional evolution through court decisions, legislative and administrative action and the changing conditions of the people, the rapidly changing political and social life of the last generation has met with no constitutional response. Previous to the Civil War, however, the naturally gradual development of the Tennessee constitution corresponded with that of State constitutions generally. In length and complexity it advanced from the less than 5,000-word instrument adopted by North Carolina in 1776 to the 14,000-word constitution of 1870. The North Carolina constitution placed property qualifications on both voting and office-holding. In 1796 what amounted to manhood suffrage was established for freemen. The 1834 constitution omitted all property qualifications but disfranchised free negroes. The 1870 constitution contains much added detail, but few changes of general importance. The 18th century declarations of the rights of individuals have continued almost unaltered to the present.

Civil and Political History.—During the early years of Statehood the two problems of chief importance were the danger from the Indians and the settlement of land titles. The two early centres of Tennessee were far apart, divided by rough mountainous country. It was many years before one could journey from Knoxville to Nashville without crossing land in the possession of Indian tribes. Strip by strip the land was bought from the Indians by the United States government. The region between the Tennessee and the Mississippi rivers known as "the Western District" was not open to white settlement until 1818; the last lands held by the Cherokee Nation in the southeastern corner of the State, were not purchased until the treaty of New Echota.

Land titles were derived from North Carolina. Ownership was acquired through military warrants by which the State undertook to pay its soldiers in land, or by purchase, through which means much of the North Carolina paper currency was redeemed. Liberal rights of preemption were given to squatters. Upon the cession of the Tennessee country to the United States, and the later cession of the State to Tennessee, there arose a long and complicated dispute to which North Carolina, Tennessee and the United States government were parties. This matter of the public lands greatly affected the development of political, internal improvement and banking. In the earlier period speculation in land also was a noteworthy factor.

For many years John Sevier was the most prominent figure in the State's life. His influence was identified with East Tennessee, the oldest section of the State. As the middle and western parts were settled, Indian wars and national affairs brought into prominence the personality of Andrew Jackson, but when Jackson became President resentment on the part of some of his actions and against his efforts to continue domination over Tennessee politics led to the rise of a vigorous Whig party, which usually prevailed in national elections. From 1835 to 1853 Tennessee was a bitterly contested State. Its relatively large population and the closeness of its vote gave it a prominence in national politics. Hugh Lawson White, John Bell, Andrew J. Donelson were nominees for the Presidency or Vice Presidency who were unsuccessful. James K. Polk was elected President in 1844. and Andrew Johnson Vice President in 1864. The prominence of these, and host of other men, was due to the fact that Tennessee in this period constituted a type and was a true representative of the West. Within the State were signs of internal improvement, especially railroads, banking, education, were prominent in political discussion. The State was almost entirely agricultural, the population of the towns being relatively very small. Slavery existed all over the State in East Tennessee, however, there arose a decided anti-slavery movement which ran its course when the most active opponents of the system emigrated from the State. Physical differences left a positive stamp upon the attitude of the different sections of the State toward slavery. East Tennessee had relatively few slaves; the western district, on the contrary, developed like Mississippi. Sentiment in the State was conservative and devoted to the Union. The two problems of chief importance were the danger from the Indians and the settlement of land titles. The two early centres of Tennessee were far apart, divided by rough mountainous country. n support of the Union. The course of events soon led to the domination of Tennessee, strongly Unionist in sympathy, by forces who kept open the communication with the Southwest to

is, while the Federal successes at Port and Fort Donelson, and the occupation of Tennessee into the possession of the Federal forces under whom Andrew Johnson appointed governor. The régime of Union..

Tennessee was perpetuated after the adoption of the new Government by devices and by the exercise of the power of the State to hold the peace of the State by its control of the resources of the State. The State has been divided into four districts, each with a territorial governor, and each with a representative in the State legislature. The State is divided into four districts, each with a territorial governor, and each with a representative in the State legislature. The State is divided into four districts, each with a territorial governor, and each with a representative in the State legislature.

The State has a population of 4,789,000, and a total of 1,081,290 females and 1,103,491 males. The total voting population is 552,668,78 per cent being white. The total number of children of school age (6 to 20 years) is 738,475. The total number of illiterates in the State (over 10 years) is 221,071, representing 13.6 per cent of the total population. As compared to 20.7 per cent in 1900. The total number of dwellings in Tennessee is 444,814. Total number of families, 462,533. Average number per family, 4.7.

Immigration.—Immigrants to the State are mostly welcomed with that geniality and hospitality which the new South has inherited from the old. Tennessee is not dominated by the arrogance of wealth, neither is it overbalanced by its city population. Prejudice of the country against the town or of town against country is a thing of the past. The numerous commercial organizations offer inducements to capital with the assurance that though a stone wall might be built about the State, yet its resources are so great and diversely scattered that a 10 times its present population would have available every necessity, every comfort and every luxury.

In conclusion, it may be said truly that Tennessee is large in area, in wealth, in industries and truly magnificent in its possibilities, and the day for indulging provincialism is forever gone.

GEORGE C. PORTER.
TENNESSEE—TENNYSON

TENNESSEE, a large river formed by the Holston from Virginia and the French Broad from North Carolina, which unite near Knoxville, in eastern Tennessee. It flows southwest, entering Alabama in the northeastern part of the State and continuing southwest to the centre of Marshall County, where it turns northward and flows across the northern part of Alabama, re-entering Tennessee in Hardin County. From here the course of the river is nearly due north across the State of Tennessee and the western part of Kentucky to the Ohio River, which it enters at Paducah, Ky. The length of the river is about 800 miles; from the source of the Holston to the mouth of the Tennessee is about 1,200 miles; the area drained is about 40,000 square miles. It is navigable, without artificial aid, to Florence, in Lauderdale County, Ala., a distance of 280 miles from Paducah. Just above Florence are the Muscle Shoals, about 20 miles long, which are navigable for about one mile in spring. A canal has been built to overcome this obstruction to navigation. Above the Shoals, the river is navigable for light-draft steamers nearly all the year. The navigable waters of the upper course of the river, together with the Holston, are about 930 miles. The principal tributaries are the Clinch, Duck, Elk, Hiawasse, and Sequatchie rivers. The Tennessee is the largest tributary of the Ohio River, entering the Ohio 10 miles from the mouth of the Cumberland River. See BOUNDARIES OF THE UNITED STATES.

TENNESSEE, Army of the, one of the divisions of the Confederate army in the Civil War. After the battle of Shiloh (q.v.) it was commanded by General Halleck and later by Grant, Sherman and others.

TENNESSEE, University of, the State university located at Knoxville, Tenn. It was established in 1794 as Blount College; a non-sectarian institution and was incorporated by the first general assembly of the Territory southwest of the Ohio; in 1807 the name was changed to East Tennessee College and in 1840 to East Tennessee University. In 1869 the State legislature gave to the university the control of the Congressional land grant of 1862; in 1879 it was further recognized as a State institution by an act connecting it with the public schools of the State, and in that year its name was changed to the University of Tennessee. The board of trustees consists of 14 members appointed by the governor and confirmed by the senate for a term of 12 years from each Congressional district and two each from Knoxville and Memphis; the governor, the commissioner of agriculture and superintendent of public instruction, being ex officio. The university is coeducational. It comprises colleges of liberal arts, agriculture, including experiment stations, engineering and law at Knoxville; colleges of medicine, of dentistry and school of pharmacy at Memphis. Military science and drill are a part of the curricula and are required of the men students in the freshmen and sophomore classes. In 1902 a teachers' summer school was opened on the university grounds with the co-operation of the college of agriculture and the principal sciences. The university has a division of extension, including agriculture, home economics, public health, rural engineering and education. Short winter courses are given in the agricultural, home economics and engineering departments. The campus proper at Knoxville contains 39.9 acres, at Memphis 1.7 acres, and the university farms contain 1,634 acres; there are 18 buildings, including dormitories on the campus. The productive funds amount to $427,000; the annual income to approximately $800,000; the library contains 40,000 volumes. The students number 2,400 to 2,500 normally and the faculty over 250.

TENNESSEE CENTENNIAL EXPOSITION, held at Nashville, Tenn., in celebration of the State's 100th anniversary of its entrance into the Union. Its dominant purpose was to show the history and development of the State and to emphasize its resources. The site chosen was West Side Park, a former race-course, a tract of about 200 acres. More than 100 buildings were erected, and the departments included agriculture, art, commerce, construction, education and hygiene, government, history, machinery, mineral industries, transportation, women's work, etc. The president of the exposition was John W. Thomas. The total attendance was 1,780,714; the receipts were $1,101,285, exceeding by $89 the disbursements. Consult Just, The Official History of the Tennessee Centennial Exposition' (1898).

TENNIEL, ten-nil', Sir John, English cartoonist: b. London, 1820; d. 1914. He received no regular art training. In 1845 he was selected by public competition to paint a fresco in the Houses of Parliament at Westminster, but he is better known as a book-illustrator and a cartoonist in Punch, on whose staff he worked during the 50 years 1851-1901. He also illustrated a number of important books. He was knighted in 1893. His cartoons are unique in contributions to a comic paper, being of classic severity in line and expression and often tinged with a tragic seriousness of meaning which exalts their author as not only a great caricaturist but also a great poet. This can be more powerful than the political suit which characterizes the majority of them, a satire whose geniality neither deadens the life nor blunts the point of their irresistible humor.

TENNIS. See LAWN TENNIS; RACKET.

TENNYSON, Alfred, Lord, English poet: b. Somersby, Lincolnshire, 6 Aug. 1809; d. Aldworth, near Haslemere, on the border of Sussex and Surrey, 6 Oct. 1892. His boyhood was passed at his father's country rectory, in an atmosphere that was full of poetry and music; and at a very early age he began to try his wings in verse. Some of his youthful efforts were published in partnership with his elder brother Charles, in 1827, in a volume entitled 'Poems by Two Brothers.' Two years later he entered Trinity College, Cambridge, and became a member of an intimate society called 'The Apostles,' which included some of the most brilliant young men in England. Among them was Arthur Henry Hallam, the closest friend of Tennyson. In 1829 he won the Chancellor's Medal with a poem in blank-verse called 'The Princess.' (See SUMMER POET.) In 1830 he published 'Poems, Chiefly Lyrical,' a slender volume of new and delicate melodies.
er his father’s death in 1831, he left without taking his degree, and for 60 t followed he gave himself to a poet’s h a clear resolution which never volume of poems published in 1832 a distinct growth in strength and skill. it a tiny book, but there was a quality ich more than made good a lack of it be Lady of the Lake, The Isle of the l-Eaters, The Palace of Art, and um of Fair Women, revealed the of a true dreamer of dreams, gifted magic which translates visions into The Miller’s Daughter, The May and ‘New Year’s Eve,’ showed the one who felt the charm of English nery and common life with a senti- fresh and pure and deep that he on be able to lay his hand upon the r of the people.

Before this highest potency of the poet’s d come to Tennyson, there was need nism of conflict and sorrow, to purify in the mere love of art for art’s sake, hence in becoming a masterly in the art of exquisite verse—and to consecrate is to the severe and noble service of and truth. This liberating and experient was enfolded in the poem which fell upon him in Arthur Hal- liden death at Vienna, in 1833. How us irretrievable loss shook the poet’s ow closely and how strenuously it m to face the mystery and the mean- life in lonely spiritual wrestling, was closed, after 17 years, in the famous ‘Memoriam.’ But the traces of the and some of its fine results were seen lier, in the two volumes of ‘Poems’ appeared in 1842, as the fruitage of a silence. ‘Ulysses,’ ‘Morte d’Arthur,’ son Stygites,’ ‘Dora,’ ‘Locksley Hall,’ on of Sin,’ ‘The Two Voices,’ and nortal lyric, ‘Break, Break, Break,’ the work of ‘An idle singer of an empty day.’

I had entered into his poetry. His d been born again, from above. He place with the master-minstrels who s a full voice out of a full heart, not sterie, but for the age and for the 1 the recognition that Tennyson really to this higher class of poets—a on which at first was confined—to a cted circle, but spread by degrees to r reading public—that prepared an audience for his first long poem, which appeared in 1847. The sub- s the eternal “woman question,” in the form of an epic, half heroic and orous; the story of a king’s daughter right to emancipate (and even to her sex from man, by founding a L woman’s college, but was conquered or at least modified), by the love of us, chivalrous, dreamy prince, who nd married her. The story is un g. The blank verse in which it is beauty, though it is often too ornate. lusion of the poem is a superb tribute to “the eternal womanly.” But the little interludes of song which are scattered through the epic shine as the chief jewels in a setting which is not all of pure gold.

In 1850 the long-delayed and nobly-labored elegy on the death of Hallam was given to the world. It is hardly too much to say that ‘In Memoriam’ stands out, in present vision, as the most illustrious poem of the 19th century. C e r tainly it has been the most frequently trans lated, the most widely quoted, and the most deeply loved. It is far more than a splendid monument to the memory of a friend. It is an utterance of the imperishable hopes and aspirations of the human soul passing through the valley of the shadow of death. It is a unique group of lyrics, finished with an exquisite artist’s care, which is only surpassed by the intense and steady passion which fuses them into a single poem. It is the English classic on the love of immortality and the immortality of love.

In the same year with the appearance of this poem happened the two most important events, of Tennyson’s career. He was married in June to Miss Emily Sellwood, a lady of artful and beautiful endowments, who proved herself through a long line of unselsh devotion the true partner of a poet’s existence. And he was appointed in November to succeed Wordsworth as poet laureate.

His first official poem was the stately ‘Ode on the Death of the Duke of Wellington,’ in 1852. The majestic march of the verse, its freedom, its organ-toned music, its patriotic vigor, and the lofty solemnity with which it closes, give it a higher place than can be claimed for any other poetical production of an English laureate for a public occasion. ‘The Charge of the Light Brigade,’ written in 1854, was a trumpet-note that rang through England and echoed around the world.

‘Maud’ was published in 1855. It is a lyrical monodrama, in which the hero, a sensitive and morbid man, with hereditary tend ency to madness, tells the story of his re demption from misanthropy and despair by the power of a pure love, unhappy but victorious. The variety of the metrical forms in this poem, the passionate tenderness of the love songs, the beautiful truth of the descriptive passages, and the intense personality of its spirit give it a singular charm, which is felt most deeply perhaps by those who are young and in love. Tennyson himself said I think ‘Maud’ is one of my most original poems.‘

In 1859 began the publication of the epical sequence called the ‘Idylls of the King,’ the largest and in some respects the most important of the works of Tennyson. The first group contained ‘Enid,’ ‘Vivien,’ ‘Elaine’ and ‘Guinevere.’ The second group appeared in 1870, and consisted of ‘The Coming of Arthur,’ ‘The Holy Grail,’ ‘Pellae and Etta’ and ‘The Passing of Arthur.’ In 1872 ‘Gareth and Lynette’ and ‘The Last Tournament’ were published; and in 1885 ‘Balin and Balan’ was printed in the volume entitled ‘Tiresias and Other Poems.’ The division of ‘Enid’ into two parts—‘The Marriage of Geraint and ‘Geraint and Enid’—makes the epic, as it now stands, consist of 12 idylls. Each of these clothes an ancient legend from the Arthurian
TENNYSON

Cycle in the richest and most harmonious of modern blank verse. The idylls are so far independent that any one of them might stand alone as a complete poem. But there is a connecting thread running through them all in the threefold love-story of Arthur, Guinevere and Lancelot, and in the history of the Round Table. The underlying motive of the whole series is to shadow forth the war of Sense against Soul. The idylls are to be interpreted, therefore, as movements in a symphony, the theme of which is the rightful royalty of man's spiritual nature, seeking to establish itself in a settled reign of law, and constantly opposed by the disorderly and disintegrating elements of humanity.

In 'The Coming of Arthur,' it is doubt that threatens the kingdom; in 'Gareth and Lynette' the conflict is with false ambition; in 'The Marriage of Geraint,' with pride; in 'Geraint and Enid,' with jealousy; in 'Balin and Balan,' with suspicion; in 'Merlin and Vivien,' with lust; in 'The Holy Grail,' with whatsoever organ voice was stifled. The power of unlawful love, which has crept through all the court, and Arthur's Round Table is dissolved in ruin— but not without a vision of peace for the king who has kept his soul sustained, and a dim promise of new hope for some future age, when he shall return to bloodless victory.

Tennyson has not allowed the ethical purpose of these poems to confuse their interest or bedim their beauty. They are not in any sense an allegory. The tales of love and light-erancy, of tournament and battle and quest, are vividly told in the true romantic spirit, lighting up the olden story with the thoughts and feelings of to-day. There is perhaps a touch of over-elaborateness in the style; but after all the figures stand out as distinctly as they ought to do in such a large tapestry. In the finer idylls, like 'Guinevere' and 'The Passing of Arthur,' the blank verse moves with a grandeur and dignity, a broad, measured, fluent harmony, unrivaled in England since Milton's time.

The rest of Tennyson's poetical work includes his dramas — 'Queen Mary,' 'Harold,' 'Becket,' 'The Cup and the Falcon,' and a few others—and several volumes of miscellaneous poems, such as 'The Earl of Arden' (1881), 'His Tragic Tale' (1879), 'Ballads' (1880), 'Tresses' (1885), 'Locksley Hall Sixty Years After' (1886), 'Demeter' (1889) and 'The Death of Génon,' published posthumously in 1892. The great age to which his life was prolonged, the unwavering fidelity with which he devoted himself to the sole pursuit of his chosen art, the freshness of spirit which made him delight in labor to the very last, and the fine versatility of mind with which he turned from one field of production to another — this taught him to pass that both in amount and in variety of works Tennyson stands in the front rank of English poets; but two can be thought of — Shakespeare and Robert Browning — who produced more.

In 1883 a title of nobility was offered to Tennyson through Mr. Gladstone. This honor, which he had declined at least once before, he now accepted; and in January 1884 he was admitted (we can hardly say elevated) to the peerage — taking his title, Baron of Aldworth and Farrington, from his two country houses, in Sussex and in the Isle of Wight.

It would be difficult, of course, to size the style and estimate the various and fertile poet in a brief statement of the qualities in the Tennyson which are unmistakable and which are characteristic:

1. His diction is singularly lucid, melodic, and musical. He involves the phrase in its force and strength. Not only in his choice of metres, but choice of words and cadences, we see an influence controlling his verse. So results in a loss of force or definiteness, makes it poetry, whether in the lines of 'Locksley Hall,' or in the measures of the shorter songs, possible. Any one who recites it aloud, how natural it is to fall, as Tennyson did, into a rhythmical tone, almost like this close relation of his poetry to be felt also in the quality of subtle-ness, of intimate and indefinable charm, makes his brief lyrics as perfect as of their kind in the world's literature.

2. He has an extraordinary truthfulness of touch in natural description and appears equally in minute, pre-Raphaelite, where he speaks of the color of different trees in early spring, or in which a wave-crest is reflected in hollow before it breaks; and in landscapes, where he renders the thing, the coming storm, or the still glory of autumnal morning, in a few broad lines to this the quality of blending and interlacing all his epistles and descriptions with the poem, so that they do not the feeling but enhance and deepen, have one of the traits by which the Tennyson is most eagerly distinguished.

3. His range of imaginative sym- shown in his ballads and character very wide; but it moves for the natural and normal rather than eccentric lines, his respect from those of Browning to press the feeling of the philosopher's tius, of the peasant in 'Rizpah,' of in 'The Children's Hospital,' of the fighter in 'The Revenge,' of the intrepid lover in 'Ulysses,' in order to each, not that which is exceptional that which is most deeply human.

4. His work reflects with artistic the scientific and social movement. The discoveries and inventions of are translated into poetry. His verse the planets are molded of star-dust and of an unfinished creation is still in the possible, often, to assign dates by an allusion to a comet, or some critical event in history of mankind. It is true that many of the new devices to bring uranium. He takes a dark view of the elements of 19th century civilization he feels the forward movement would be
TENNYSION

Poetry mirrors truly the spirit of modernism — with shadows. In its form, so in its spirit, the verse of Tennyson expresses a constant and controlling sense of law and order. He is in the camp from the poets of revolt. Har-

ioritism is sober, steadfast, thoughtful, iding. His love moves within the bounds of purity and reverence. His conception of the absolute is never akin to blind force, but car-

thin itself the higher elements of intelligible and voluntary restraint.

Self-reverence, self-knowledge, self-control. —

These three alone lead life to sovereign power.

The poetry of Tennyson is pervaded by a nd religious spirit. His view of the —his view even of the smallest flower blossoms in the world—is illuminated through and by his faith in the Divine and goodness and beauty. He cannot see of a purely physical universe. Nothing has written could have been written as

he had been an atheist or an agnostic.

Tennyson takes more from the side of the feelings, imitate spiritual instincts and cravings of life. The strongest of these is the desire for a life beyond the grave. To this for immortality he gives full play, and it some of the strongest and sweetest tones music. From 'The Deserted House' to 'ing the Bar,' his poetry is an evidence of the conviction that death cannot end all, that in the life that is to come elevates his conception of the life that now gives a new meaning to duty and to love.

Then we think of the many noble poems he has written and expressed, — 'The Two', 'The May Queen,' 'Locksley Hall,' 'Arden,' 'The Leper's Bride,' 'Guinevere,' 'In Memoriam,' 'Vastness,' 'Wages,' may well call Tennyson the poet of the life influence upon the thought and feeling age has been far-reaching and potent. stood among the doubts and confusions of latter days as a witness for the things e invisible and eternal, — the things that ay forget if they will, but if they forget their hearts wither and the springs of run dry. His verse has brought new courage to the youth of to-day who the spirit of the invasions of materialism. In the conflict for the enlargement of faith to e the real results of science, he stood as a leader. In the great silent reaction from the desperate solitude of a age the clear bright, calling the unwilling exiles of belief again. And when he passed away from home at Aldworth, with the moonlight on his lips, the poet felt as for a mighty prophet, oiced for him as a poet who had finished

his course and kept the faith. See Enoch Arden; Idylls of the King; In Memoriam; Locksley Hall; Maud; Princess, The.

Bibliography.—Editions: Standard editions of Tennyson are the Cambridge edition by W. J. Rolfe (Boston 1898); Cabinet edition (1 vol., ib. 1899; 2d ed., 1899); Household edition (ib. 1899); Riversideside edition (7 vols., ib. 1904); New Popular edition (3 vols., ib. 1906); Globe edition (New York 1907); Eversley edition, by Hallam, Lord Tennyson (5 vols., ib. 1908); Everyman's Library (ib. 1910); 'Works of Tennyson, with Notes by the Author,' edited with Memoir by Hallam, Lord Tennyson (ib. 1913); The Farringford edition, by Eugene Parsons; Athenæum Press edition (12 vols.); by Henry Van Dyke and D. L. Chambers (1912). Concordances and Bibliographies: Baker, A. E., 'Concordance to the Poetical and Dramatic Works of Alfred, Lord Tennyson' (London 1914); Brightwell, D. TENNISON, Frederick, English poet: b. Louth, 5 June 1807; d. Kensignton, 26 Feb. 1898. He was elder brother of Alfred Tennyson (q.v.). He published several volumes of poems of considerable merit, namely: 'Days and Hours' (1854); 'The Isles of Greece' (1860); 'Daphne and Other Poems' (1891); and 'Poems of the Day and Year' (1895).

TENNISON-TURNER, Charles, English poet: b. Somersby, Lincolnshire, 4 July 1808; d. Cheltenham, 25 April 1879. He was an elder brother of Alfred Tennyson (q.v.), with whom he collaborated in the 'Poems' of 1827. He took the additional name of Turner by royal license on succeeding to property at the death of a great-uncle. He became vicar of Grasby, Lincolnshire, in 1837, and published 'Sonnets' (1864); 'Small Tableaux' (1868), and 'Sonnets, Lyrics and Translations' (1873). In 1880 these were reprinted with additions, under the title 'Collected Sonnets, Old and New.' These writings manifest that he possessed much poetic genius. His greater brother regarded some of his sonnets as among the finest in the language, among them being 'The Rookery'; 'Lettie's Globe'; 'Orion'; and 'The Lion's Skeleton.'

TENOCHTITLAN, ten-och-te-tlan', the ancient name of the City of Mexico. See Mexico.

TENOR, the highest natural adult male voice. Its compass generally extends from C in the bass to G or A in the treble. Professional singers may take from C to C'. The qualities of the tenor render it suitable to the expression of tender and delicate sentiments. In a vocal composition of four parts the tenor forms the second middle part, deeper than the alto, but higher than the bass; but in the song of four male voices, the tenor, as the first voice, has the chief melody, and as the second is the higher middle voice. The clef of this voice is the C clef on the fourth line of the staff, but the treble or G clef is commonly used, though an octave too high. A singer having a high-pitched voice, or a musical part for such a voice, is also termed tenor, and sometimes a voice, tuned between the bass and the alto is so named. See Voice and Voice Culture.

TENORITE, the native black oxide of copper, CuO, occurs on the lavas of Vesuvius in small black scales of brilliant metallic luster. It is susceptible to wear and weathering, and the solution formed by the decomposition of chalcopyrite and other copper ores.

It occurs in Ducktown, Tenn.; Morenci, Ariz., and elsewhere.

TENOS, te'nos, Greece. See Tinos.

TENSA, a river in the southwestern par of Alabama, the eastern channel through the united waters of the Tennessee and the Alabama rivers pass to Mobile Bay. The western channel is called Mobile River (q.v.). At the mouth of the Tensas is Fort Blakely where took place an engagement between the Union forces and the Confederates, 25 March 1862. See Fort Blakely, Siege and Capture of.

TENSKWATAWA. See Tecumseh.

TENT, a portable dwelling-place formed of flexible material, as blankets, hides or more commonly canvas, stretched with cords on poles. Tents are chiefly used in Europe and the United States as shelters for soldiers, although the fur-hunters in the country, following the Indians, made partial use of them. The most common form of tent is the A tent, having a ridge-rod across which a canvas is slung and sloped to form the main roof, the sides being fastened by cords to stakes in the ground and the wings being hung for sides. When a hoop is used instead of a ridge-rod as the main support it is a bell-tent. The circus tent usually has two or more main masts, with ridge-rod or ropes between them, and a vast spread of canvas reaching to the ground.

TENT-CATERPILLARS, caterpillars of some moth of the genus Clionarura, especially the apple-tree or spring species (C. americana) of the northeastern States. The moth is of medium size and plain colors. Its eggs are laid in autumn in the form of bands of 300 to 400 glued about the twigs of fruit-trees. They hatch early in spring, and the caterpillars begin to spin nearly forked twigs a triangular silken web or tent, in which they take shelter and grow; many other trees as well as those of the orchard are affected. They go out in the daytime to feed on foliage and at night gather inside the web, which should be burned at night when it is populous, or destroyed by a spray of kerosene. The caterpillars become pupa in June, and then a long, hairy, with a white dorsal stripe and numerous fine crinkled black lines on a yellow ground, united below into a common black band, with a blue spot on the side of each ring. Then the caterpillars spin their dense white tough cocoons behind the loose bark, or boards, and the moths appear about July 1. Another species, often very destructive to the foliage of shade trees, is the forest tent-caterpillar moth (C. disstria), whose caterpillars are to be distinguished by a row of spots instead of a line along the back. The more common tent-caterpillars of the Pacific Coast are the larva of the early C. californica and of the later C. costreca, both orchard-pests. The last-named live in colonies but do not make tents.

TENTACULIFERA, a sub-class of the Infusoria having no cilia in the adult condition but provided with them during the embryonic period. The distinguishing feature of the group is found in the so-called tentacles which are very highly differentiated organs, some adapted for piercing, while some again are adhesive. They are emitted from the entire surface of the body or occur
s at the angles. Such tentacles are capable of protrusion and retraction, and have the distal end expanded into a bulb. In structure a tentacle is tubular with a central core of thin-walled tissues. When partly retracted a band of constrictor muscles appears as a spiral ridge inside the hollow lumen. There are several branches such as Dendrocometes, sessile on plates of small fresh-water crustacea, idroroma, a larger colony, attaining a length of two millimeters and superficially an extraordinary resemblance to a zoophyte. In the latter the nucleus is an axial structure branching out from the entire colony. Young forms are by division or gemmation, and are nourished by virtue of a ciliary covering on the outer surface of the colony when the sets of tentacles are replaced by the tentacles when the colony settles down in a permanent environment.

THE CENTURY. The tenth century is esteemed as one of the lowest in achievement. Undoubtedly fewer arts and documents representing physical and intellectual accomplishment have come from it than from corresponding periods in other centuries. The principal reason for this is to be found in the almost continuous invasions of the centuries that followed. Those who were most affected by this condition were the Germans and the French, over the possession of Lorraine which culminated nearly a thousand years ago. The German emperor of that time, Otto, invaded and devastated the whole country of the Franks almost to Paris, and was forced to make a disastrous retreat and the greater part of his army perished in a battle on the Aisne.

England after the magnificent reign of Alfred continued for some time to grow in peace and prosperity. Alfred's son Edward (reigned 901-25) conquered Mercia and East Anglia, strengthened the government and protected his people against invasion by the building of many strongholds. He encouraged town development and patronized learning, founding schools, though the tradition of any connection between the Saxon schools of this time and Oxford or Cambridge is mythical. Æthelstan (925-40) further extended the Saxon rule so that all of the old Saxon Heptarchy (seven kingdoms) came under his domination. He commanded in the "great battle" famous in subsequent history against an allied army of Danes, Scots, Gaels and warriors from the Orkney Islands. These Northern peoples with their great claymores always struck terror into their enemies before this but Saxon troops proved capable of withstanding their charge. Æthelstan came to be looked upon as one of the most important kings of Europe and royal alliances with his family were eagerly sought, his sisters Edwina and Editha marrying the kings of France and Germany. He may be called the first king of all England. In the second half of the century, however, the Northmen landed in England in large numbers and gradually secured a firm foothold. The Danes under their king, Sweyn, threatened to overrun the country and their withdrawal was obtained only by paying a ransom. Needless to say this only proved to be a bait for more invaders from the Northern countries.

A more hopeful development came at the end of the century with the introduction of Hungary into European history. Stephen, one
of the chiefs of the Hungarians, was with his father received into the Church and proceeded to make his people Christian. He was crowned as king (977) and his reign is mainly in the next century, but the spirit which led him to convert little Christian Gisulf of Capua and the prelates of Cluny and to found a series of hospices for pilgrims in Jerusalem, Rome, Ravenna and Constantinople so that travelers from his country might have a refuge when they visited the holy places of the 10th century. He encouraged learning and did much to break the savage spirit of his people. His court became a refuge for the English royal family when Canute conquered the English and he deeply influenced Saint Margaret of Scotland. The tradition of social helpfulness established by him culminated in Saint Elizabeth of Hungary in the next century.

The one country in western Europe in which the Northmen were unable to gain foothold was Spain. When the Northmen landed at Galicia they devastated the country for a while, but were defeated and almost exterminated in the battle of Clontarf (939). After this, the Christian kingdom of Leon was the initial step in this and the prelude to the heroic age celebrated in the Spanish chronicles and ballads. Abderrahman III (981-993) under whom the Almoravids rose to its greatest height, was defeated in 986 by Ramiro II, king of Leon and Asturias (died 950), in the great battle on the plain of Simancas (31 July 939). After this the Christians continued to advance in power and the Arabs to recede.

The most interesting character of the period is Dunstan, archbishop of Canterbury, proclaimed saint by popular estimation of the good work he did for his people. He was probably born early in the century in a well-to-do family. In his youth he was a favorite at court until jealousy led to his banishment. Disillusioned with worldly things he became a hermit at Glastonbury but after a time the fame of his life as a solitary led the king to recall him as an adviser. Dunstan took advantage of his place at court to encourage learning and patronize art. He himself was deeply interested in the arts and crafts and the making of beautiful things and after his death he became the patron saint of the goldsmiths' guild. He is said to have taken part in the making of bells and organs as well as the altar vessels. Nothing delighted him more than the teaching of boys in the cathedral school and he encouraged manual training as well as intellectual development. The rich who saw his good work provided him with funds in abundance and he used them for the building and restoring of churches and the establishment of schools. He reformed monastic life which had suffered severely during the disturbed period while the Northmen were landing in England. Dunstan was most famous, however, for his care of the poor and the needy. He was often called upon to act as judge in law suits and his maintenance of the rights of widows and orphans made him popular. He died in 988 and until the martyrdom of Saint Thomas of Canterbury was the favorite saint of the English people.

The most significant intellectual event of the century was the writing of a series of plays by Hroswitha, a Benedictine nun of Gandersheim, St. Gall, and Cloisters of Cluny and to a series of histories for pilgrims in Jerusalem, Rome, Ravenna and Constantinople so that travelers from his country might have a refuge when they visited the holy places of the 10th century. He encouraged learning and did much to break the savage spirit of his people. His court became a refuge for the English royal family when Canute conquered the English and he deeply influenced Saint Margaret of Scotland. ogland was ruled by Canute. Fian ne the seat of manufactures of linens and for the cheese and the wine of id Genoa began their great com - rees in connection with the trade East. The Moors in Spain under nan III built some beautiful buildings cities, and set an example to put on an attraction for the many who came down to the Spanish to make their studies at famous schools.

AL EVENTS OF THE TENTH CENTURY.
the Elder, King of the Angles and Saxons, on of Alfred the Great, makes peace with the settled in East Anglia and Northumbria, and as the “Laws of Edward and Guthrum.” en from Norway and Denmark, from this year throughout the century, continue to ravage the Russian, British, Irish and French coasts, and although they rejected from Spain, extend their depreda - tions. They establish colonies in Normandy, upon the Danish, and in the northern islands.

duke of Franconia is elected emperor of the he Powler becomes Henry I, King of Germany, y and north Italy are divided into doksdoma - nicipalities. The third or Saxon dynasty commences with Henry I who extends his territory: increases his estates several margraves. The silver mines of G are discovered. Industry and wealth increase. The Elder, King of the English, and is “chosen as father and lord” by Saxon, Danes, Norwegians and Welsh after 16 campaigns.
the Elder dies and is succeeded by Adelinado selects the Saxon Heptarchy.

of Germany stems the Hungarian invasion, the Great succeeds his father Henry I as King and concludes peace with Louis IV of France after war.
ain breaks out over Lorraine and is ended by brother Bruno, Archbishop of Cologne.

Ungarins are finally driven out of Germany, eating them in a brilliant victory at Lechfeld. y defeats the Slavs who had ravaged Saxony, apet is made Duke of France.
ha, dramatist. Benedictine religions, and the poet, who composed "De idonis" to the emperors Otto I and Otto II.
the Martyn becomes King of England.

nd is colonized from Iceland by Northmen who Christian missionaries there. They also reach the North American continent. The dissolution of the Frankish Empire and the third dynasty, Hugh Capet the of the third dynasty is elected King of France, unestan, archbishop of Canterbury, dies.
I is crowned King of Hungary and enters into relations with Christian leaders of Western becomes a Margrave. The Grecian Empire is restored to the Bulgarians on Mount Haemus and Russian invasion. The Turks in possession of nd Syria extend their empire and give the title to their rulers.

at honorary. Villainage or serfdom is in Western Europe. The principal towns republics. Hereditary estates on a military establishment. The dukes and counts become Arab learning attains a high standard. The only education founded by Charlemagne is obliterated in the upheavals of the Frankish but faith and learning are safeguarded by the for the intellectual advancement and uplift of y.

James J. Walsh, f "The Thirteenth Greatest of Cen - JRE is a legal term denoting the reign of the which title to real estate is held, ated during the feudal system of England. Defined the relation which existed be - tween the lord of the manor and the tenant. The term tenure in its modern signification is extensive and may implicate the mere possession of real property, or the particular manner by which same may be held. A tenure paid for in services was formerly known as socage. See also FEUDAL SYSTEM.

TENURE OF OFFICE, the manner by which an office is held, as well as the duration of its term.

TENURE OF OFFICE ACTS. (1) An act of 15 May 1820 which provided a four-year term for certain officers, such as collectors of customs, etc. (2) An act of Congress passed in 1867, vetoed by President Andrew Jackson and passed over his veto on 2 March. The chief provision of the act was that requiring the consent of the Senate to the removal of any officer appointed with its advice and consent. In case of the misconduct of officers thus appointed, except judges, when the Senate was not in session, the President might suspend such officer and designate another to perform his duties until the Senate should act in the case. Many other objectionable provisions were included in the bill, which was aimed at limiting the power of President Johnson. The latter’s disregard of the act in removing E. M. Stanton from the Secretarship of State was one of the main grounds of his impeachment. Under Grant’s administration in 1869 many sections of the act were stricken out, and in 1887 it was practically repealed altogether. (See JOHNSON, ANDREW, Consult McLaughlin and Hart, “Cyclopedia of American Government” (New York 1914), and “Statutes at Large” (III, 352; XIV, 430; XVI, 6; XXIV, 500).

TEOCALLIS, té-ó-kál’ís, the ancient temples of Mexico, of which there are two which remains. They are distinguished by a pyramidal base, square in plan, and rising in stories or terraces, or in an incline of 45 degrees, to an upper platform, on which the temple stands. The most extensive is the pyramid of Cholula near Mexico, said to have been built before the arrival of the Aztecs. In plan it measures 1,440 feet each way, and has four terraces, reaching a height of 177 feet. Its area is nearly four times that of the great Egyptian pyramid at Giza, but in strength of material and skill of workmanship it is vastly inferior, and is now merely a mass of ruins. At Palenque, in Yucatan, is a better-preserved temple. The pyramid rises in an incline, consisting of an unbroken flight of steps, 280 feet square and 60 feet high. The temple is 76 feet wide in front and 26 feet deep and is ornamented with bas-reliefs in stucco and hieroglyphic tablets.

TEOSINTE, a fodder-plant. See GRASSES OF THE UNITED STATES.

TEPHIRITE. A mineral consisting of manganese ortho-silicate 2MnO·SiO₃, contains 70 per cent MnO; abundant at Franklin Furnace and Sterling Hill, N. J.

TEPIC, tā-pē’k, Mexico. (1) A territory on the Pacific Coast between the states of Jalisco and Sinaloa, organized under Mexican government in 1889; area, 11,273 square miles. It is a mountainous country inhabited by tribes of semi-independent Indians. It includes the volcano of Ceboruco, still active. The Santiago and Macquarri rivers flow through it. There are
rich mineral deposits, little operated. Pop. about
175,000. (2) The capital, Ténc, lies about 25
miles inland from the port of San Blas, with
which it is connected by a railroad. It stands
on a commanding plateau, and manufactures
cotton-cloth and tobacco, and has a population
of about 17,000.

TEPLITZ, tér'lit's, or TÖPLITZ, tér'lit's, Bohemia, a watering place in a mountain valley,
30 miles southeast of Dresden. Its interesting
features are the castle with its beautiful
grounds, the town church, bathing establish-
ment, Rathaus, etc. Its mineral baths are the
most celebrated of the country. They consist of
12 hot springs, allh-thermal, and are of
great efficacy in rheumatic affections. The
Triple Alliance between Austria, Russia and
Prussia against France was signed here in 1813.
Pop. 27,000.

TERAMO, tér'a-mó, Italy. (1) Capital of
the province of its own name, at the confluence
of the Tordino and Verzola, 40 miles northwest
of Chieti. It is a bishop's see, and the cather-
dral dates from the 14th century. The municipal
offices and the exchange are the principal
buildings. The remains of Roman baths, ther-
as and aqueducts indicate the site of the
ancient Interamna. The manufactures include wax, pottery, leather, straw hats, orna-
mental furniture and cream-of-tartar. The
ascent of the Gran Sasso is made from this point. In 1460 a fierce battle was fought here
between the Milanese allies of the king of Spain
and the forces of the Duke of Anjou of France.
The ruins of the castle of San Flaviano, in the
plains nearby, mark the site of this conflict.
Pop. of the commune about 25,070. (2) The
province lies in southern Italy, and is traversed
on the west by the Abruzzi Mountains. Several
streams flow through the province to the Adri-
atic. Wine, grain, oil and silk are the chief
products, and the fisheries are important. The
Ancona-Brendisi Railway follows the coast,
with a branch to Teramo, the capital. Pop.
320,000.

TERAPHIM, small images or objects
similar to the household gods of the Romans,
and which are mentioned in several places in
the Bible. The reverence paid to them appears
to have been very ancient. They were human
in form, and from being merely venerable, or
used as aids to devotion, might easily become
objects of idolatry. The earliest mention of
teraphim is in Genesis (ch. xxxi, 19), where
Rachel is said to have stolen her father's
teraphim, which Laban (ver. 30) calls his gods.
In the story of Micah (Judge xv, 5) the word
occurs in our Authorized Version. It was a
teraph that Micah, David's wife, put into the
bed (1 Sam. xvi, 14) to deceive the messengers
of Saul. Josiah is represented (2 Ki. xxiii, 24)
as putting away the teraphim. In Ezek. xxi,
21 they are represented as used by the king
of Babylon for purposes of divination. Con-
stantin, Benson, L. 'Hebraische Archaologie'
(Tübingen 1867).

TERATOLOGY, that branch of biological
and anatomical science which treats of abnor-
malities or monstrous growths in the structure
of plants and animals. While ancient writers
dealt with such deviations from normal types of
structure, malformations appealed to their
imagination as portents of objects of origin, rather than to their defici
tions as subjects of investigation. 18th century superstition began to
physical observation, and the study of
causation in monstrousities became
portant branch of natural history. In
the germ is regarded by many embryologists as the original cause of some human
tereditary persistence of certain defects in numerous cases resulting. Other malfo-
forms are believed to be due to disease of the brain or the uterus, and to various
disorders. Consult Moquin Tandon, 'De teratologie vegetale' (1841); Fish
's 'Transactions of the Solec Society of the State of N.Y.,
66-67-68; Masters, 'Vegetable Teratologia' (1869); Penzig, 'Pflanzenteratologie'
94'.

TETRIBUM, one of the rare minerals found chiefly in the minerals of the
gadolinite group. It belongs to the yttrium phosphate family and has an atomic weight of 158.8.

and the siphon tubes is a much wrinkled
band, by which the teredo adheres to row."
appearance of the teredo burrow is very

Outwardly the piece of timber in-
shows a number of very small holes. y it resembles nothing more than a
hese. The channels run in all direc-
tions, sometimes so close to each other that the
wood separating them is as thin as paper. But
between the holes there is always a partition,
for the animals never interfere with each other.
Their sense of hearing seems to enable them to
tell when they are approaching the outside of the
wood or are nearing another burrow and
they turn aside. The holes are always lined
with irregularly laid shell and they generally
go with the grain. Like many other mollusca
the teredo passes through a long series of com-
plicated metamorphoses before arriving at full
maturity. The eggs, from the beginning of the
breeding season in May, are confined in the gill
cavity. Here they have their first period of
growth. From the gill cavity the embryos are
discharged in the form of free-swimming ani-
imals covered with vibrating cilia or hairs, by
which they swim. In this stage they are almost
exactly like ciliated infusoria. Next they lose
these locomotive filaments and develop a rudimen-
tary bivalve shell. In the third stage their
relation to other bivalves is apparent in their
resemblance to the common mussel. They have
a mantle and shell covering their entire body
and another sort of cilia replaces those lost.
This bivalve character is further established
by the development of a long foot used for
creeping and by the appearance of eyes and
organs for hearing. These eyes, however, dis-
appear as the animal elongates and the loco-
motive cilia are lost. In this stage the young
teredo, settling on some convenient piece of
wood and starting with a hole about the size
of a pin-head, begins his burrow, and enlarges
it as he goes on, until he has reached his full
growth.

The fact that the ship-worm does not use as
food the wood it excavates, but simply passes
it through its body, has much to do with the
failure of many attempts to make wood teredo-
proof by poisons. Up to date creosote and
dead oils are the remedies which have given
the best results. The piece of lumber to be so
treated is first steamed. Next the air is ex-
hausted and the poisonous or noxious com-
ound is forced in under a pressure of 400
ounds to the square inch. Usually, however,
this system fails of complete desire. From
Christiania, timbers poisoned in this manner
were found to be, three years later, quite
riddled with teredo. In some instances, how-
ever, piles so treated have been known to re-
main free from ship-worms for as many as
15 to 20 years.

Although poisoned timbers are often used
for such structures as government docks (which
must be as permanent as possible), for ordinary
piers and for submerged work, the expense of
so treating the wood is greater than the
the cost of periodical renewal. Of course the
most thorough defense would be one which pre-
vented the entrance of the young animal. Cop-
per-sheathed vessels are quite free from its at-
tacks, while copper paint, creosote or coal tar
frequently applied has the same effect. Piles
may be defended by broad-headed nails closely
driven, for the ship-worm seems to avoid enter-
ing any wood impregnated with iron rust.

A large species of teredo (**T. gigantea**), from
Sumatra, has been found to measure from four
to six feet, and to have a diameter of about
three inches. It bores into the solid mud, and
TEREK.—TERHUNE.

does not appear to destroy timber like its smaller neighbor. Consult Cooke, 'Mollusca' (London 1898); Verrill 'Invertebrates of Vineyard Sound' (Washington 1873).

TEREK, té-rék', Russia, a river in Circassia, which rises in Mount Kasbek, at the north of the Caucasus, among icy glaciers. It follows a northwesterly course through a narrow valley, then turns east and after dividing into numerous branches enters the Caspian Sea by a delta. Its entire length is nearly 400 miles, only a small distance being navigable. The main tributaries are the Ardon, Uruch, Malka and Baskan on the left; the Sunsha, Assa and Argun, on the right. A series of small fortifications for protection against the mountains tribes are built along the river from Moscod to the foot of the pass over the Great Caucasus, where the descent is made into Georgia.

TERENCE, té-rénς (PUBlIIUS TerentIUS APER), Roman writer of comedies: b. Carthage, Africa, between 185 and 195 B.C.; d. probably in Greece, 159 B.C. While yet a child he was bought by Publius Terentius Lucanus, a Roman senator, who took him to Rome and gave him a liberal education. His sister having emancipated the young African now assumed the name of his benefactor. Lelian and Scipio Africanus (the destroyer of Carthage and Numantia) admitted him to their intimacy, and as some aver, assisted him in the composition of his plays. In his 24th year he went to Greece, where he is said to have translated 108 of Menander's (q.v.) comedies. Six comedies of Terence's alone are extant—the 'Andria,' the 'Ennius,' 'Hecatommiiromenos,' 'Phormio,' 'Hevra,' and the 'Adelphi;' his last piece, brought out in Rome the year before his death. The comedies of Terence were much admired by the cultivated Romans for their exquisite style, the language of Cicero, Caesar and the orators, and were likewise esteemed for those maxims and moral sentences. If we compare him with Plautus, his only important predecessor, we miss what Caesar styled the 'vis comica,' that sparkling wit and humor which made Plautus the model of Molère. On the other hand, Terence has the finer vein of sentiment, the more subtle power of characterization and the purer latinity. He was indeed the founder of polite comedy, the comedy of society in Europe and his influence has been felt throughout the whole history of literature. Most of his plays follow closely the originals of Menander, but from the fragments of Menander which remain they do not appear to be mere translations. The comedies of Terence have been translated into English by the elder Coleman and several others. (See Aen- over.) Consult 'The edition of Bentley' (1726); Vollbehr (1846); Dzitakzo (1848); and Conrad, 'Die metrische Composition der Comödien des Terentius' (1876).

TERESA, té-résą (Sp. tá-ré-sa) Saint (properly Theresia), Spanish conventional reformer: b. Avila, Old Castle, 28 March 1515; d. Alba, 4 Oct. 1582. Her attention was drawn in childhood to the lives of saints and martyrs and when she and her brother were children under 10 they set off into the country of the Moors in hopes that some infidel would seize and kill them on account of their faith and that they would thus obtain the crown of martyrdom. Defeated in their object they attempted to become hermits. Her father, a nobleman, Don de Cepeda, placed her, after the death of her devout mother, in a monastery at Avila when she was 16 and though she lived for some years there without any of her early religious enthusiasm, a change came over her at 20 and she took the veil. Her new spirit of devotion was deepened by reading the 'Confessions of Saint Augustine' and being much distressed by the apparent decay of discipline which she saw around her, she founded in 1562 another convent at Avila, dedicating it to Saint Joseph and introducing a new order, the Discalced or Barefooted Carmelites, also called Teresians. She began by making this a genuinely mendicant order, but modified this detail of the rule in obedience to her superiors. From this mother house there sprang 16 other institutions of the same order since 1525 and in later part of her life in traveling from one to another of these branch houses and the staff, cross and rosary she wore on these pilgrimages are still preserved at Avila. She was seized with her last illness in the palace of the Duchess of Avila, but at her own request was carried to her convent of San José, where she expired surrounded by her followers. Gregory XV canonized her (1622) and appointed 13 October as her festival and Urban III declared her the second patron saint of the monarchy of Saint James (Santiago) being the first. This decree was confirmed by the Cortes in 1812. She also has a worldwide reputation as a mystic, and among the most famous of the books of devotion which the Roman Catholic Church can boast are her five works: 'Discours o Réencion de Su Vida' (1562); 'El Camino de la Perfección' (1563); 'El Libro de las Fundaciones' (1577); 'El Castillo Interior' (1581); and 'Santos Concepciones del Amor de Dios.' These have been translated into most of the languages of Europe. Consult 'Saint Theresa' (edited by Cardinal Manning, 1865); Graham, 'Santa Teresa' (1834); Jameson, 'Legends of the Monastic Orders'; Thérèse et son Mysticisme' (1893); Joly, 'Saint Teresa' (1903); and 'Vie de Sainte Thérèse, Ecrite par Elle-même' (15th edition, edited by Jules Peyré, 1904).

TERHUNE, té-rún', Albert Payson, American fiction writer, traveler and journalist: b. Newark, N. J., 21 Dec. 1872. He was graduated from Columbia in 1893 and in 1898-9 traveled on horseback through Syria, investigating leper settlements, living among the Bedouins, etc. He has been connected with the New York Evening World since 1895 and is an expert writer on historical topics. His publications include 'Syria from the Saddle' (1890); 'Dr. Dale: a Story Without a Moral' (with his mother, Marion Harland, 1900); 'Caló Convoye' (1907); 'The Fighter' (1907); 'Dad' (1914); 'Damon and Pythias'; 'Golumbe Stories'; 'Stories of the Superwomen'; 'The Woman' (1912); 'Dollars and Cents' (1913); 'The Years of the Locusts' (1915), etc. He is also the author of the New York World's famous Popular Educational Series that has been running in 50 American newspapers since 1906.
TERHUNE — TERMITES

RHUNE, Mary Virginia Havens in Harland), American novelist and in domestic science; b. Amelia County, Dec. 1831. She began to write for the been 14 and in 1856 was married to Ed- tion. She conducted Baby- or two years, established the Home- n 1888, was a department editor on the Saint Nicholas and Wide-Awake and of the Philadelphia North. Her works are widely and her cook-books and articles on nd management are of practical value ensively circulated. The latter include in Sense in the Household' (1872); her Year-Book' (1877); 'Marion Har- dodel Housewife'; etc. She was the or of the movement to finish the monu- er Mary Washington’s grave and wrote erance of her purpose 'The Story of washington' (1892). Her other works 'Alone' (1854); 'The Hidden Path? Nemesis' (1860); 'Husbands and (1868); 'Loiterings in Pleasant Paths' His Great Self' (1892); 'More Colo- nestories' (1899); 'Dr. Dale,' with her P.Terhune (1900); 'Distractions of (1906); 'Where Ghosts Walk' The Long Lane' (1915), etc.

LINGUAITE, a native oxychloride gury, occurring in minute monolich in the recently-discovered mercury de- f Terlingua, Texas. It is transparent, ulphur-yellow color, brilliant adamam- grade, hardness between 2 and 3, specific 37. It is intimately associated with the mercury minerals, eglosite, and dite. See American Journal of Science XVI, September 1903.

M, in law, (1) a limited or specific of time. (2) The time during which may legally transact business. In the States terms vary according to the of judicial business and the available (3) The time set for the payment of 4) An interest or estate in land for a ace, as a year. If the term is for life hold and, therefore, treated as ready if for years only, it is merely a peri- ter, and the event is personal. (5) the period within which a party ral to produce evidence to support assert in his plea.

MINAL MORAINE. See MORAINE.

MINI MERERE. Study in the prov- falentine. In a cool, clear night of the mo- and late winter. The scene is bright, a snow, and the San. River is in a cataract where In the winter the river is frozen over. The water is very cold, and the ice is hard. The river is wide, and the water is deep. The scenery is beautiful, and the air is fresh. The snow is white, and the trees are covered with snow. The sky is blue, and the clouds are white. The river is broad, and the water is clear. The scenery is beautiful, and the air is fresh. The snow is white, and the trees are covered with snow. The sky is blue, and the clouds are white. The river is broad, and the water is clear.

MINETTE. In the garden, a type of hand- and used, it was witt- shipped in Italy as Jupiter Terminus. The or- gin of this worship was attributed to Numa, who ordered that every one should mark the boundaries of his land by stones consecrated to Jupiter Terminus and hold these stones up every year at the festival of the Termini, sacrifices of cakes, meal and fruit. This law also applied to the state, but the public termini were neglected in the later period of Roman history, while the termini of private property long retained their sacred character. A Ter- minus stood in the temple of Jupiter in the capitol. On Roman coins a Terminus is represented like the Greek Herm, a square column surmounted by a head.

TERMITES, WHITE ANTS, or DUCK- ANTS, a family of insects composing the order Isoptera, which have a superficial resemblance to ants, though far removed from them in structure, being allied to the Mayflies. They also resemble ants in being social insects, living in colonies and building masts or hives. They are widely distributed in tropical countries, but also occur in the temperate parts of North and South America and a few have established themselves in Europe. Their food consists for the most part of wood, especially in a state of incipient decay, but they also eat a great variety of substances, including dead comrades and excrement. The termite society consists for the most part of wingless, sexually immature individuals, children, potential of both sexes, which do not grow up. Besides these workers there is a less numerous caste of largeheaded, blind, strong-jawed soldiers, but these are not so well differentiated as among the true ants. The workers collect food, form bur- rows and tunnels, build "hills" and care for the males, eggs and larvae. The males and females have wings, which the latter lose after impregnation. Then, indeed, the female or queen undergoes a remarkable change, be- coming enormously distended with eggs and sometimes attaining a length of two or three inches or more. A large cylindrical package, in shape, like a sausage and as white as a bolus. As only the abdomen swells, the sur- rounding disproportion between anter and post- erior parts is very striking. The sexual dimorphism is extremely pronounced, having been known to lay 60 eggs in a minute or above 5000 eggs in a day. In the royal chamber a male also is kept. It is hardly necessary to say that the queen could not live if the queen. For to under- stand the importance of a most notice that it is spring, the young winged male and females leave the nest at a warm, after which party take place, the sexual activity of the stu- amination of the termites.

E. M.
comprise a public and a high school, 1 receipts and expenses of the munici- ount to about $7,500. Pop. 2,000.

A BAIXA. See MARTA OF THE LOW-

A COTTA, hard baked clay or 12 of exceptionally good quality, of ture, hard and durable. The 'Eng-

nace of Architecture,' completed be-

was much use in England of ma-

de with cement, speaks of it as arti-

2; but the term has also been used 3 that ancient earthenware of which the painted Greek vases which are so in the history of art, and the inferior interestings pieces of Etruria. In com-

2, however, the term is employed for 3 clay as is used in connection with e, whether in actual building, as follow mass of the baked clay takes of a stone, or where a solid casting e material is used for molded string-

ed the like, in this way replacing differs from brick in being harder, quality and molded to some special ornament.

cotta is exposed without a coating of namel, and its brown color constitutes article. Japanese figures — groups, the like — which were called "imita-

3" when they were first brought to untries are really terra cotta. They very beautiful in design, having the r of modeling and perfect finish of artis which is found in the Japanese. The raku-yaki, that interesting brown h is used for tea-jars and tea-bowls joy of the collector, is also a variety cotta.

European Middle Ages terra cotta, and also covered by a colored enamel, for roof tiles, and also for the much orate pieces employed for crestings, ially for those finials (in French h are used where the hips of the roof dge and where in this way a saiment reduced. These finials often include vane which, however, would be com-

wrought iron. The custom of using u in these ways lasted into the time ival of classic architecture, and some 3st interesting pieces are French of century: the custom not disappearing complete establishment of pseudo-

formity of design throughout Europe, ops pierced with decorative openings which the smoke might issue were also cotta and the custom still lingers nly built houses of Italy. Greece and d, where chimneys are built of hard thenware tiles set in strong cement d in this way made very light and decorative pieces were also made of tal; but in the way of architectural the most important development was Ilha Roubia ware (qui), which h-

st often spoken of as terra cotta be-

s covered completely by an opaque hich receives a most brilliant and olychromy, adding in this way color e in the most emphatic and interest-

n since antiquity. Still such pieces as

do the door-heads of many churches in Florence and elsewhere and the magnificent altar-backs; the lavabos or washing-fountains and the like throughout central Italy are among the most effective pieces to be found in that region. The most extensive and splendid work in Della Rob-
bia ware is the broad frieze of the Hospital at Pistoia.

In the 18th century terra cotta, which had always been used by the French sculptors for the permanent form of many works of art, re-

ceived a fresh impulse from the practice of Jean Antoine Houdon (q.v. see also UNITED STATES, SCULPTORS OF), Claude Michel (q.v.) (called Clodion) and others, among whom should be named certain makers of medallions as well worthy of study as the bronze medall-

ions of the Italian Renaissance. In modern French practice portrait busts are very fre-

quently made in baked clay, the same artistic quality being given them as to works in bronze or marble. The difficulty caused by the shrinking of the piece in the drying and subsequent baking is only to be met by extreme care in the selection and preparation of the material. The piece shrinks, but it may be made to shrink uniformly and without disturbing the symmetry.

Modern architectural terra cotta continually comes to the front as a material allowing of much richer treatment at a reasonable price than carved stone; but for some reason it never becomes very general in its application. A large business building in New York had its roof brackets or consols made of this material before 1855. The old Boston Museum of Fine Arts contained much decorative terra cotta brought from England and this front was com-

pleted about 1865. The constant demand for fireproof materials by means of which the exter-

ior of a large building may remain without serious damage in spite of a hot fire across the street has made concrete, brick and terra cotta the obvious material for the facing; but stone, marble and granite still retain their places in many structures.

In making monumental figures, groups, de-

signs, etc., of terra cotta the steps are: Mixing and kneading the clay; molding the clay; baking, for taking off any blemishes; baking; coloring and sometimes gilding. Modeling by hand is now rare, except in designing for a mold. The high grade work acquires its perfection largely by careful retouching. Baking requires to be performed slowly to permit evaporation of the moisture without injury. The coloring is mostly done after firing, solid body colors being employed, as browns, blues and reds, with occasional black or bright colors for sane de-

tail. Some of the Roman terra cottas are in a fine state of preservation though dating back 2,000 or more years.

Within recent years there has been a marked increase in the use of terra cotta, often colored, for ornamenting steel and concrete buildings and for roof-tiles. Consul Strack, H., 'Brick and Terra Cotta Work During the Middle Ages' (Boston 1914); Walters, H. B., 'The Art of the Greeks,' (London 1906) and the 'Annual of British School at Athens.'

TERRA DI LAVORO, têr-râ-dê lâ-vô'rô. See CASERTA.

TERRA VERDE, or VERTE (Italian "green earth"), a green mineral pigment used
by painters in oil. A deposit of this earth is found in the neighborhood of Verona, Italy. There is a similar deposit in the island of Cyprus. The native green found in Italy is a silicious earth colored by protoxide of iron, which contains about 20 per cent, and is of extreme value as a permanent and brilliant tint in landscape painting.

TERRACES, successive benches or levels along the sides of valleys. A valley may show one or several terraces, varying greatly in height and in width. If composed of rock they are known as rock terraces. These may result from the presence of hard layers of flat-lying rock, as on the sides of the Grand Canyon of the Colorado. In other cases they are the results of successive uplifts, a narrower valley each time being inscribed within the broader older valley, leaving a remnant of the older valley bottom as the terrace. Alluvial terraces are composed of stratified gravel, sand or clay. Their history is usually more complex. After a given valley has been eroded, the first step is the filling of its basin with alluvium to some depth. This may be brought about by many causes. Particularly did it occur during glacial times, when the streams flowing away from the Ice front were overloaded, filling them above their glacial outwash. Any cause which, after the valley is filled, will start the rivers to eroding, will obviously leave a gravel bench on one or both sides of the river. This renewed erosive activity may, in the case of glaciation, be merely the melting away of the glaciers, with the consequent return to normal conditions. It may be the result of uplift and rejuvenation of the streams, or it may result from climatic or other causes.

TERRACINA, tér-rá-ché'né, Italy, in the province of Rome, on a golf of the same name, near the Pontine marshes, about 18 miles north-west of Gaeta, and 56 miles southeast of Rome. It is a historical town lying on the Appian Way. It was sacked in 409 and again in 508. It is the see of a bishop and has a cathedral and handsome episcopal palace. The cathedral is built in the Italo-Byzantine style and incorporates the pillars of an ancient temple. Excavations have revealed the remains of a splendid temple of Venus. The main occupation consists in the fisheries. Pop. of the commune about 12,000.

TERRAPIN. See DIAMOND-BACK TERRAPIN; Turtles.

TERRAPIN, tér-a-pin, a tortoise of the family Emydidae. There are several different members of the family, all of which are fresh-water or tidewater. The name is also applied to the "elephant terrapin" of the Galapagos. Terrapins are held in great favor by epicures, especially in the United States.

TERRAE HAUTE, tér’é hót (French, meaning "high land"), Ind., city, county-seat of Vigo County, on the Wabash River, and on the Chicago and Eastern Illinois, the Evansville and Terre Haute, the Indianapolis, the Chicago, Terre Haute and Southeastern, and the Cleveland, Cincinnati, Chicago and Saint Louis railroad. It is 178 miles south of Chicago, 168 miles northeast of Saint Louis, 152 miles northwest of Cincinnati, and 72 miles west of Indianapolis. There are more than a
dozens lines of railroads entering
of which were built in 1905. It is most prominent railroad and
cities of the Middle West. Terre
of the oldest settlements in the State, it was laid out as a city, and in 1824 chartered.

Topography.—The city is beautiful on an elevated plateau, amid its surroundings. It is connected with side of the river by several large bridges, and for the use of the there was constructed a fine bridge (price, $27,000). There are several park
broad streets in summer time present a appearance. The residential part has
edifices in most beautiful surroundings.

Industries.—The city is in a natural region and in the centre of comprising over 2,000 square miles, a fuel supply which, at the present rate of consumption, will not be exhausted for 200 years. Coal is shipped from here to points within a radius of 400 miles. It is a distribution point for about 1,500 carloads per day. The city is the industrial and commercial center of a large portion of the western part of Illinois. The manufacturing industries embrace rolling foundries, distilleries, breweries, flour
hospitals, car works, railroad shops, factories, stamping works, feed
works, factories, and carriage factories. The vicinity are large deposits of shale and a great number of clay plants are in operation nearby. In 1910 (government census), the number of manufacturing establishments was 170; total capital invested in plants, $371,000; average employees yearly, 5,000; annual wages paid to employees, $2,219; material used during year, $8,657; annual value of products, $21,793,000; due to the failure of the natural gas supply in places, there has been since 1910 an abundant mixture of natural gas and liquid fuel. The railroad facilities accounts for the large increase in population.

Public Buildings.—The prominent buildings are the government building, county courthouse, city hall, opera house, Union station, the schools, churches, institutions, hotels and several business.

Charitable Institutions and Orphanages.—The Rose Ladies' Aid Society cares for the number of the poor, and has the home for old ladies. This home has an endowment of $100,000. The other institutions for the relief of the sick and aged are Saint Anthony's Hospital (bui in 1860), in charge of the Sisters of Charity of Charity of Providence; Rose Dispensary, endowment, $300,000; building, $130,000; Hospital (Protestant), endowment, $300,000; Rose Dispensary, endowment, $200,000; number of church aid societies.

Education.—The educational institutions are the Indiana State Normal School, which annually enrolls over 1,000 pupils; Polytechnic Institute, founded in 1883; two public elementary schools, Roman Catholic and Lutheran parish schools.
TERRELL — TERRIER

(Roman Catholic); Saint Mary’s of the Is, a school for girls; a public library and a branch, and Normal and Polytechnic Institute.

and Finances.—The three national banks have a combined capital and surplus of $1,000,000; one savings bank has depositing $1,700,000; and three loan companies, capital and surplus $1,000. The average annual cost for maintenance and operation is $400; the public school costs about $29,000; the total $50,000.

The city is governed by a mayor and council. The mayor appoints all officers, and the council appoints the city manager, who in turn appoints all other officers.

RELL, tér’él, Joseph Meriwether, politician: b. Greenville, Ga., 6 June 1819; yachtsman, b. in February in 1884 and 1886 was elected to the house of representatives. He was noted for his statesmanlike ability and was attorney-general for that State. He resigned in 1902 to accept the appointment of governor of Georgia, to which he was elected in October of that year.

RELL, Tex., city in Kaufman County, Texas, with Midland and Dallas, about 30 miles east of Dallas. It is industrial and stock-raising region, being the largest wagon cotton market in the hief manufacturing establishments are railroad shops, cottonseed mills, cotton gins, cotton compresses, and factories for the manufacture of use dresses, sun bonnets and aprons, a large trade in wheat, oats, cotton, hay, and livestock. The principal buildings are the North Texas Hospital for the poor, Carnegie Library, Elks, Home, academy, and city hall. There are churches. The educational institutions are Texas Military College, a select training school for boys with military and civil courses; two high schools (one for white and one for Negro students), graded and academic, and one private primary school. Three of the combined capital of $600,000, has a commission form of government, ative, referendum and recall features nment in hands of commission of five, each of the three wards of the city from the city at large, the functions being invested in the chairman of the commission.

Commissioners elected for two years being elected one year and three years.

The MSS. AUSTRALIANS. See La Barraca.

RESTRIAL, or CONTINENTAL, °TS, those laid down on land in continental sediments laid down in the sea may be alluvial, formed by rivers plains: glacial, formed by glaciers; wind-blown material such as sand dunes; or lacustrine, laid down in lakes. Terrestrial deposits, like marine, may consist of gravel, sand, shales, and conglomerates, sandstones and shales. Terrestrial limestones are rare, though they may form in swamps, or as wind-blown shell fragments, as the eolian limestones of Bermuda. Continental deposits are not likely to be as extensive or as regular in composition as marine beds, since the conditions under which they are formed are more variable. They are often marked by rain prints and sun cracks and by fossils of land plants and animals. See section on Sedimentary Rocks, in article on Rocks.

TERRESTRIAL MAGNETISM. See MAGNETISM.

TERRIER, the name of several small breeds of dogs. The terriers were originally used for capturing foxes and for killing rats and other vermin, and several kinds are still employed in these and similar occupations. Some are good watch-dogs, and others are useful as retrievers. The most popular variety is the fox terrier, which came into fashion about 1830. It is generally white, with a smooth, dense, hard coat; its chest is deep and not broad; neck fairly long; nose black; ears small, V-shaped, pendulous. The maximum weight is about 20 pounds, and in accordance with a cruel practice the tail is frequently docked. There is also a wire-haired variety of the fox terrier. The bull terrier, for show purposes all white since 1860, is a larger animal produced by crossing a terrier with a bulldog. It has a long, tapering head, black nose, long and slightly arched neck, wide and deep chest, short, close, stiff, glossy coat and a comparatively short, tapering tail. The Boston terrier is a new and popular American breed, of great docility, kindness and quality. The Irish terrier, a trifle larger than the fox terrier, is of a reddish-yellow, wheaten or light-brown color inclining to gray, with a hard, wiry coat free from silkiness. Its chest is deep and medium wide; head long and flat; nose black; ears V-shaped and pendulous; neck long and slightly arched, and its tail usually docked and carried high. The Scotch terrier, a smaller animal, has a rather short, wiry, very dense coat of various colors, such as steel-gray, brindle or grizzled, black, sandy and wheat. It has a tapering muzzle, black nose, small, prick or half-prick, sharp-pointed ears, short thick neck, broad and deep chest, uncult tail carried high with slight bend. The Skye terrier, the smallest of useful terriers, may be of any color. Its coat is double, the under part consisting of short, close, soft hair, and the outer part of long, hard hairs, free from curl or crisp. It has a long head, black muzzle, prick or pendant ears, deep chest, long and gently crested neck and short legs, and its tail may be carried either high or low. The Clydesdale or Paisley terrier is a kind of prick-eared, silky-coated Skye terrier. One of the modern varieties is the Welsh terrier, about the size of the fox terrier, with a close, wiry coat of sand, tan or black, grizzle and tan color. There is also an English white terrier, not unlike a small bull terrier. The Dandie Dinmont is a favorite small one, of a pepper or mustard color, with a moderately long coat consisting.
of harsh and soft hair mixed but without wiriness. Its large head is covered with soft, silky hair; nose black or dark; ears large and pendulous; tail of moderate length, with a regular row of hairs; hind feet. Bedlington terrier is a slightly larger form, somewhat similar to the Dandie Dinmont. The black-and-tan or Manchester terrier has the head long, flat, tapering; nose black; ears small, V-shaped, hanging; neck long and tapering; chest narrow and deep; tail of moderate length, tapering; coat close, smooth, short, glossy; color jet-black and mahogany tan in different parts. He was produced by long years of skilful selection by the Manchester mill-hands of England, and is one of the smartest, pluckiest vermin-killers and most interesting pets on the list. The Schipperke resembles it, but is of German origin. One of the largest of the terriers is the Airedale, with pendulous ears, deep chest, high tail, hard, being straight and close, and of a tan, black or dark grizzle color. The Yorkshire is the best known of the small top terriers. Consult Lee's 'Modern Dogs' (1896); Huntington, 'The Show Dog in America' (Providence 1901).

TERRIGENOUS, derived directly from the land, a term applied to those marine sediments like sands and clays, which are of direct land origin, as contrasted with pelagic deposits accumulating in the deep sea as the result of organic agencies, which extract their substance from solution in sea water. See section on Sedimentary Rocks in article on Rocks.

TERRITORIAL COURTS. See COURT.

TERRITORIAL EXPANSION. See UNITED STATES--TERRITORIAL EXPANSION OF.

TERRITORIAL WATERS. See INTER-NATIONAL LAW.

TERRITORIES, in the United States, certain parts of the national domain which have not been formed into States. Starting with 13 States it has been the policy of the United States in taking in new territory to require of the inhabitants evidences of fitness for self-government. This nation first added to its territory by the Louisiana Purchase, in 1803, 828,000 square miles. Florida and another territory to the total of 72,000 square miles were annexed in 1819; Texas in 1845; Oregon in 1846; the Mexican cession in 1848; Gadsden Purchase (30,000 square miles) in 1853; Alaska (591,000 square miles) in 1867; the Philippine and Hawaiian Islands in 1898; Guam and Porto Rico in 1898 and later (about 125,000 square miles); the Panama Canal Zone (436 square miles) in 1904; the Danish West Indies (now the Virgin Islands) of 142 square miles in 1917.

Of the above only the District of Columbia, Alaska and Hawaii are regarded technically as "territories." The others that have not been granted Statehood are held as "possessions." it having been decided by the United States Supreme Court in 1901, in the "Insular Cases," that Congress can create appropriate forms of government for the new territories and legislate differently for such possessions.

The Philippines are at present governed by a commission of seven members selected by the President. The commission is subject to the power of legislation and administration by the President of Congress passed in June 1902, under the power of legislation and administration by the President, and the determination of the legislature. The Philippines are now governed, provided by law, within two years following the date of enactment of the said law, if a state of government exists in the islands, an election held for members of a legislative council; to which the upper house is to consist of members of the Philippine Commission.

As this is done the powers of local government, if now exercised by the Philippine Commission, will pass to the legislative assembly. no great degree of local self-government allowed nor are the islands rep. Washington either by a commission or otherwise.

The inhabitants are not citizens of the United States and the determination of political and civil status is left to the government. The Samoan Islands and Guam are governed by military and naval governors, respectively. The unorganized domestic Territories have governor, judicature, and other officers appointed by the President, but have neither legislature nor delegate in Congress. A local self-government has recently been established in 100 incorporated towns of 300 inhabitants each. District of Columbia is governed by three commissioners, two of whom are appointed by the President from civil life and the third appointed by the engineer corps. The general charge of the administration District, including the appointment of officers, is made by the District, except the appointment of officers. The law-making body, as in the case of Alaska and the Philippine Islands, is the House of Representatives. Half the House of Representatives is from States, and the District has no delegate to the House of Representatives. If a State is admitted, the half is from the United States, and the other half by residents.

Hawaii has obligated itself to incorp- horize the inhabitants into the American Union as soon as consistent with the principles of the Constitution. All the States thus far out of territory acquired from foreign except Texas and California, have passed through the territorial stage. No general rule is the requirement of the Territory shall be as the ratio of representation in Congress; this has often been disregarded, usually for political reasons. Thus Nevada was given political purposes when its population exceeded 20,000, while Utah was admitted long after its population exceeded 20,000. For a more detailed discussion of this subject see the articles on separate State and Territory.

TERROR, Mount, Antarctic E. Mountain situated close to N. (q.v.) on the coast of Victoria Land, 30° S., and long 167° E., its height 16,945 feet. It was discovered in 1841 by Sir Ross and named after one of his ships.
TERROR, Reign of — TERRY

ROR, Reign of, the period of the Revolution extending from the downfall of the Girondists, June 1793, to that of the 

ROR, The White, the period of British reprisal in the Second Restoration, 1678-1701. It was so called from the flag (le drapeau blanc) of the Royalists, ordered to be raised by a proclamation of James II. It was also called the White Flag of Amnesty, published in 1701, but not observed by the French. It proposed a truce, by which the French army was to retire to their own territory and to pay for the losses of the English. The French, however, refused to accept the terms of the flag, and the war continued. The flag was raised again in 1702, but the terms were not accepted. The flag was again raised in 1703, but the terms were not accepted. The war continued until the signing of the Treaty of Utrecht in 1713.

TERRY, David S., American jurist: b. Todd County, Ky., 1823; d. Lathrop, Cal., 14 Aug. 1899. He served in the Texas War against Mexico under Gen. Sam Houston and later in the war between the United States and Mexico. He was a member of the California State Supreme Court in 1855 and became chief justice in 1857. He strongly opposed the procedure of the vigilance committee. In 1859 he killed Sen. D. C. Broderick in a duel near San Francisco. He had been an uncompromising opponent of the extension of slavery, particularly in Kansas, and was active in the California campaign of 1859 and in one of his speeches made certain statements regarding the war. After service in the Confederate army during the Civil War Terry resumed practice in San Francisco.

TEROUGH, Charles, British historian: b. 1864. He was educated at Kings College, Cambridge, and graduated B.A. 1886, and M.A. 1891. He lectured in history in several noted schools and was professor in the University of Aberdeen in 1888-1903. He became a well-known writer and authority on historical subjects, his best-known publications being "The Life of the Great Artists of Europe" (1899) and "The Rising of the 1745" (1900; new ed., 1903). He was awarded the Royal Society's Gold Medal (1901) for his "The Coronation of James I" (1902); "The Young Pretender" (1903); "John Graham of Claverhouse" (1903); "The Scottish Parliament" (1906); "Craig's De Unione," trans. with notes (1909); "A Short History of Europe" (3 vols., 1911-15); "Bach's Chorals" (2 vols., 1915); "The Army of the Solemn League and Covenant" (2 vols., 1917). He also prepared catalogues of the publications of the Scottish historical clubs and an index of papers relating to Scotland.

TERRY, Ellen Alice, English actress: b. Coventry, Warwickshire, 27 Feb. 1848. She is the daughter of an actor and her parents were both actors and she made her first appearance at the age of eight, under the management of Mrs. Charles Kean, at the Princess's Theatre, London. A little later she won high praise as the young Prince Arthur in "King John." During the periods of 1860-63 and 1867-68 she acted with various stock companies, first appearing with Henry Irving in 1867, at Katherine to his Petruchio in "The Taming of the Shrew." She was married early in life to G. F. Watts, the painter, but the union was dissolved and she was married to E. A. Wardell in 1864, and again on 3 May 1907 to James Carew. She was absent from the stage 1868-74 and in 1875 won her first great success as Portia in a revival of "The Merchant of Venice" at the old Prince of Wales Theatre. This she shortly followed with the title role in W. G. Will's play, "Olivia," the result being that Henry Irving made her his leading lady and the long artistic partnership at the Lyceum Theatre was commenced. Some of her impersonations at the Lyceum have been Ophelia, Portia, Desdemona, Juliet, Beatrice, Lady Macbeth, Cordelia, Margaret in "Macbeth," "Faust," the Queen in Will's "Charles I," Pauline in "The Lady of Lyons," etc. In company with Irving she has several times visited
the United States and has been invariably successful. While still with Irving she joined Mrs. Kendal and Bebohmx Tree in a revival of ‘The Merry Wives of Windsor’ at Her Majesty’s Theatre in 1902. She was honored by a jubilee performance at Drury Lane Theatre, London, in 1906. She published ‘The Russian Ballet’ (1913). Consult her autobiography, ‘Story of My Life’ (New York 1908).

TERRY, Henry Taylor, American lawyer: b. Hartford, Conn., 19 Sept. 1847. He was graduated from Yale in 1869 and was admitted to the bar in 1870. In 1876 he became professor of law at the Imperial University, Tokio, Japan, but returned to New York in 1884 and resumed practice the following year. In 1894 he again went to Japan and resumed his former position of professor of law. In 1912 he resigned his professorship and was made professor emeritus. He returned to the United States but did not resume active practice.

He is the author of ‘First Principles of Law’ (1890); ‘Leading Principles of Anglo-American Law’ (Philadelphia 1884); ‘The Common Law’ (Tokio 1895); besides various articles in American and English legal journals. He received decorations from the emperor of Japan, the Order of the Sacred Treasure (II) and of the Rising Sun (III).

TERRY, Milton Spenser, Episcopal clergyman: b. Coeymans, N. Y., 22 Feb. 1840; d. 1914. He was educated at the Charlottesville Seminary and at the Yale Divinity School. He held various pastorates near New York between 1863 and 1884 when he was made head of the Hebrew Free Neighborhood, and professor of Christian doctrine in the Garrett Biblical Institute at Evanston, III. Wesleyan University gave him the degree of S.T.D. in 1879; in 1871 he was made a member of the American Oriental Society and in 1883 of the Society of Biblical Literature and Exegesis. In 1881 he published ‘Man’s Antiquity and Language,’ which was followed by a number of scholarly publications in studies in Semitic, Biblical Hebrew, Biblical Hermeneutics (1883); ‘Silvyn Se of the 19th Century’ (1890); ‘The New Apologetics’ (1892); ‘Biblical Apologetics’ (1898); ‘Moses and the Prophets’ (1901); ‘The New and Living Way’ (1914); ‘The Mediation of Jesus Christ’ (1902); ‘The Prime of Christian Doctrine’ (1906); ‘Biblical Dogmatics’ (1907); ‘The Shinto Cult’ (1910); ‘Baccalaureate Sermons and Addresses’ (1911). He also published several Biblical commentaries.

TERTIARIES, ter’sh-ə-riz, members of the Third Order of various religious societies in the Roman Catholic Church. They are generally lay members of religious orders who follow ordinary vocations and duties in their communities, yet participate in certain work of a given order. Shortly after the institution of the Franciscan Order by Saint Francis of Assisi in the beginning of the 13th century, numbers of lay people were affiliated with the Franciscans under certain rules and restrictions, which bound them more systematically to a life of penance and devotion than ordinary persons living in the world. The regulations of the Third Order, in other words, united them to the Franciscan Order and the laity affiliated with them as proper order, uniting in one secular all over the world and regulars in community. Leo XIII recommended Order in an especial manner to the throughout the world, as a means of sanctification to be embraced by lay desired to lead a more devout life. The Dominicans also had their Te instituted by Saint Dominic himself, what year is uncertain. It was known Military Order of Christ, originally of knights and noblemen, whose duty to wage war against heretics. After the founder this became the order of the dominicenmens of Saint Dominic; for both and constituted the third order of Te These Tertiarians, without making vows, had the assurance of great spri leges through the observance of ass and prayers; they continued in the ment of their civil and domestic relation few companies of Dominican sisters Third Order, particularly in Italy, monastic life, and became regular most celebrated of whom is Saint Claire. Other religious orders after ample of the Franciscans and Dom established tertiary associations; the the hermits in the beginning of the 15th and later on the Minims, the Servi Carmelites and the Trappists. At the time there are numbers of the laity the world affiliated with the third of observing their regulations while still in their secular vocations in the work DOMINICANS.

TERTIARY PERIOD, the space geologically considered, immediately the present, and occupying the larger part of the Cenozoic era; a rock system then formed. It is preceded by the Cretaceous. Tertiary strata were at founded with the supercontinent of Europe and it was long before their re actors were realized. They occur me in patches;—some of them of origin, others of fresh-water or of co derivation. Rocks of this age were described by Cuvier and Brongniart in 18 Paris Basin, where they are well and highly fossiliferous. The shells of these deposits were recognized as differ those of the modern time, though related while the bones of quadrupeds were of extinct species. Similar strata in other parts of Europe were subsequent. Those of Italy were found in low hills the Apenines on both sides fr of the Po to Calabria and called by who studied them, the Sapinum fosils of these beds were of a mo type than those of Paris or London neighborhood of Bordeaux, in the France, another series of Tertiary dis covered and described by M. dau 1825. The several hundred species described from these beds were f
n those of the Paris Basin and those naphoapnines, and to possess an inter-
laracter between the two. Subse-
was found that strata contemporane-
ose of Bordeaux overlie the Parisian in the limestone of the English naphapnine beds in Piedmont.

and 1829 Lyell conceived the idea tertiary beds might be subdivided ac-
the percentage of living species in the strata (French conchologist, compared ) Tertiary with about 5,000 living he result arrived at was, that in the ta, or those of London and Paris, about 31 per cent of recent species, dle Tertiary of the Loire, Bordeaux, 17 per cent of recent species and er Suhapenine Tertiary from 35 to it of living species. These results resulted in 1833. In formation still eur, which Lyell studied in Sicily, y attain a vast thickness, the per-
living species was found to be 90 or these four series Lyell applied the cene, Miocene, Older Pliocene and ocene. A still later formation (Post-
was called Pleistocene, in which the all of recent types, but the mam-
y of extinct species. The most im-
egent modification of this nomenclature se introduction of the term Oligocene; to include strata formerly classed Upper Eocene and partly as Lower r. The generally recognized divisions se up are now given as Eocene Oligo-
ene and Pliocene. At present much is laid upon the numerical method ion employed by Lyell and Deshayes. tious deposits of the typical Tertiary tars, London, the Loire Basin and enne series became well known, a f comparison became established, by lar deposits of other regions could ned. This is the method employed deeding to which division a given uld belong.

nor characteristics of geography, and animal life of the Tertiary were those of the present time, but land of less extent and were more largely y interior fresh-water basins. The the early Tertiary was evidently d more moist than that of the period t, types of plants now strictly tropi-
covering areas now under Arctic nd influences. In the United States ic and Gulf coast plain under-
eated submergence and emergence. first half of the period, the site of Coast Ranges was largely under in mid-Tertiary the Coast Ranges ve line time nearly form. The great western interior one upheaval at the close of the pre-
iod (Cretaceous) in the formation g Mountains. During Tertiary these extensive buildups on the s and in the intermontane basins, beds of terrestrial gravel, sand and w lake deposits were also formed, were active during much of the in the Rocky Mountains westward,ick beds of ash and very extensive

lava flows, as on the Columbia Plateau in Oregon and Washington. Marine Tertiary beds are found on the Atlantic and Pacific coasts. The most important of these are the strata of the Atlantic coastal plain with its expansion in the Gulf of Mexico. On the Atlantic Coast the Eocene beds are mostly clays and greensands which rest unconformably upon the Cretaceous strata and are unconform-
averlay by the Miocene beds. All of these beds are highly fossiliferous, shell predomin-
ating. In the Miocene is a great bed of diatomaceous earth (q.v.) from 200 to 300 feet thick. In South Carolina, Pliocene beds make their appearance. No Oligocene strata are known from the Atlantic Coast. On the Gulf Coast the Eocene is well represented and rests upon the Cretaceous. It consists mainly of marls, greensands, clays and sands. Both Oligocene and Miocene are represented on the Gulf Coast. The Oligocene is characterized by a warm-water or subtropical fauna. The cene beds of the Gulf States represent the ad-
vent of the colder water fauna from the North. Pliocene beds of the age of those formed in South Carolina are extensively developed in Florida.

Tertiary deposits are well developed in the interior of the United States between the Miss-
sissippi River and the Rocky Mountains. They consist of non-marine strata, partly lacustrine, partly eolian and partly made up of wash from the mountain sides in the form of coarse alluvial cones or fans. In these deposits nu-
erous bones of extinct mammals are found, of which extensive collections have been gath-
ered in the various museums of the country, particularly in the American Museum of Natu-
ral History in New York. Most of the deposits are in isolated basins, and can only be correlated by their vertebrate fauna. On the Pacific Coast, all the epochs of the Tertiary are represented, being in part marine, in part terrestrial.

Life of the Tertiary.—At the close of the Cretaceous period all the flying reptiles and dinosaurs, and most of the marine reptiles, seem to have become extinct; and the Tertiary formations, so far as known, yield only forms of Vertebrata essentially similar to those of the present day. Among fishes, all of the exis-
ting suborders and many of the existing families or even genera seem to occur in the Eocene. Among the invertebrates, ammonites, belemnites and most of the crinoids had passed away when the Tertiary era began; and forms came in, whose descendants are now familiar to us. The Mammalia suddenly appeared as the dominant type on all the continents and the evolution of many of the minor groups can be traced. Primitive tapirs and primitive horses, with four toes (Orohippus and Eohippus) occur. Among the Oligocene mammals may be mentioned the Miohippus or horse with only three functional toes. The peculiar Oredon occurs in beds above the Titanotherium and represents a type intermediate between hog and deer in structure. Early camels, the ear-
est true carnivores, early bats, squirrels and rodents and marsupials also occur in these beds. Miohippus, a still more modified horse, occurs in the John Day and the Deep River beds; in the latter also occurs the oldest mastodon. In the Loup Fork beds occur Procarnus, Mastodon and dogs of the genus Canis. Con-

See CENOZOIC ERA; CHEROKEE STAGE; CLAIBORNE STAGE; EOCENE; MIocene.

CHARLES LAURENCE DAKE.

TERTIUS GAUDENS (Lat.), a diplomatic phrase meaning a mischief-maker; a third party who rejoices while two others are quarrelling and hopes to profit by their disjunctions.

TERTULLIAN (Quintus Septimiua
Florens Tertullianus), ecclesiastical writer. b. Carthage, c. 160; d. c. 230. The son of a pagan centurion in the proconsular service, he received a fine literary education and became as conversant with Greek as with Latin. He studied law and probably practised it, while he displayed a mind of great ability and perception. In his writings he displayed intimate knowledge with juristic terms and methods. In early manhood (not later than the year 197) he was converted to Christianity by the admirable courage of the martyrs, although the precise date is not known. He was married, but this did not prevent him from being ordained priest, probably of the church at Carthage. About the middle of his career he publicly joined the Montanists and the vigor which he had displayed in defense of the faith against paganism was then displayed against the Church. Saint Jerome mentions certain affronts of the Roman clergy which may have provoked the fall of the great apologist. Since Tertullian was of a fiery nature, extreme and inclined to rigorism, the new prophet (as Montanism was styled) with its severity in morals and in discipline had a natural and powerful attraction for him. But his restless spirit could not long be satisfied with Montanism and he became the leader of a separate sect, called after him Tertullianists. Tertullian was the most fecund, original and powerful genius in all the history of Christian Latin literature, which he in fact created. Nearly all of his works are of a polemic character and this brings out strikingly his penetrating intelligence, vast knowledge and inspiring eloquence. His style is energetic and concise, sometimes at the expense of clearness. Saint Jerome says that he is full of ideas but difficult to read. However, his works were seldom quoted until after the 16th century renaissance. It is not easy to draw a hard and fast line between Tertullian's Catholic and Montanistic works. To the years 197-198 belong the apologetic writings 'Ad nationes' (2 books), 'Apologeticum,' 'De martyris' (4 books), 'De testimonia anime' and 'Adversus Judaeos.' Other works of approximately the same period, but of less certain date, are 'De prescriptione haereticorum,' 'De oratione,' 'De patris et filium et Spiritum sanctum,' 'De cultum,' 'De idololatria,' 'De patria' and 'Ad uxorem' (2 books). The Montanistic writings, including those tinged with Montanist as well as those wholly Montanist, are 'De corruptione virginum et virginibus velandis,' 'Adversus Hermogenem,' 'Adversus Heresum,' 'Adversus Valentinianum,' 'De anima,' 'De Christi,' 'De resurrectione carnis,' 'Ad Fraceseum,' 'De paliolo,' 'De pudicitia monomagia,' 'Ad Scapulam,' 'Ad martyrum in Scapulam.' Tertullian's 'Apologeticus' dressed about the year 197 to the provinces of the empire in which Christians, if not the first of the Latin tribes in point of time (see TERTULLIAN, SCAPULUM), is one of the first in the impetus subject and its literary beauty. Important works of Tertullian have notably the lengthy Montanistic work 'Apologia.' The Vienna 'Corpus scripturorum ecclesiasticorum' contains an edition of Tertullian's works. 'Ante-Nicene Library' contains translations nearly all of his works.

Bibliography.—The patrologies of the Church and others and the bibliographies of the Church and others and the bibliographies of the Church are not mentioned in this article. See TERTULLIAN, SCAPULUM (1903); Fuller, John, Jr., 'Tertullian and His Times' (London 1894); 'A Dictionary of Latin Biography,' Vol. IV, London 1897.

HERBERT F. V.

Sometime of the Department of Latin, University of America.

TESLA, Tesla, Nicola: b. in the province of Lika, Austrian Croatia, in early education in Gospić, attended a Real Schule, Karlstadt, against 1873; studied at the Technische Schule, Graz, capital of Croatia, the intention of becoming a professor of mathematics and physics, but became interested in electricity and took up and completed his engineering course. He afterward studied telegraphy and languages at Prague and Munich, keeping up meantime his electrical engineering studies. For some time he was employed in the government telegraph engineering department as an assistant and when invented several improvements which attracted attention. Then he became engineer for a lighting company in Paris and next in attention to the United States as a pioneer in the field of electrical and experience. He formed a connection with the Edison company at Orange, N. J., but gave up this engagement in order to be entirely free in his work. He has made himself well known throughout the many practical inventions and the brilliancy of his ideas as to the possibilities of electrical science. These ideas aroused widespread interest, have in degree diverted attention from the contributions of Tesla to the world of electrical science, and most of which were developed in the Tesla laboratory which he established for the purpose of electrical research. Tesla's researches in electric created a new field of electrical research in which the possibilities of electrical science have been exhausted. He was the first to conceive an effective method of undulating current, converting electrical energy more simply, effectively and economically than by the direct current. He invented the modern principle of the
field, embodied in the apparatus used
anmision of power from Niagara
has also invented many new forms
as, transformers, induction coils, con-
are and incandescent lamps, the oscil-
ating steam-engines, and dynamos, etc.

ings of Nicola Tesla' (1894) and the
ectrical trade journals.

RETTA. See TREASURY, THE LITTLE
OF THE D'URBERVILLES, the
in the novels of Thomas Hardy,
shed in 1891. The sub-title, "A Pure
fully Presented," explains Hardy's
ough technically guilty of an of-
ociety and ultimately hanged
mer of her seducer, the heroine,
resented throughout as the victim
stance or, more exactly and more
ically of the author, as the victim
ant and malignant fate. This is per-
in the brutal and emotional Aesch
le, but it is also quite as destructive
istic temperament, of everyday life
are. The main point appears in the
phrase in the last paragraph of the
uicide was done and the President
notions (in Aeschylean phrase) had
port with Tess." The tragedy, as
ardy's more sombre stories, is in-
ful. As in the best of the
ovels, there is the usual fully and
drawn background of local scenery
mbers, whose characters are carefully
id are vivid portraits of local types
duals. The novel is rich in rural and
enes, of which the description in the
le the seven "phases" of the book is
ily skilful and beautiful. On pub-
 Tess of the D'Urbervilles" attracted
eal of attention by reason of its sub-
treatment of which was thought to
and to too searching an attack on
s, but the literary and poetical skill
or has never been better displayed
he descriptions of customs, life and

-PAPER, slips of unsized paper
olutions of vegetable coloring mat-
a are liable to the presence of acids
is, and, in some instances, of special
ounds. The most common test-
itmus and turmeric papers; the
apers are colored with an aqueous
le of a blue substance obtained from
pecies of lichens, the latter with a
pirit of a yellow powder obtained
ng the roots of a species of Curcuma
 in India and Java. Blue litmus is
acid, the blue color being again by
alkalis; turmeric is turned brown.
There are also pheno-phthalein and
al paper, which cannot be classed as
coloring matters, though organic,
use of papers soaked in inorganic
is, is not infrequent in analytical

-AMENT. See Bible.

ICLE, one of the two genital glands
le in which the spermatozoa and some
 constituents of the semen are
formed; a testis. The term is also applied
either of the posterior tubercles of the optic
lobes or corpora quadrigemina. The testicle
proper lies in the scrotum, is of an oval form
and is mostly invested with a pouch or closed
space of serous membrane, the tunica vaginalis,
derived from the peritoneum during the descent
of the gland from the abdomen into the
scrotum. The organ consists of a central por-
tion or body, an upper enlarged extremity, the
globus major or head, and a lower extremity, the
globus minor or tail. Lying upon the pos-
terior border of the testicle is a long narrow
flattened body, the epididymis. To this border
is attached the spermatic cord, composed of
arteries, veins, lymphatics and nerves, con-
ected together by areolar tissues and invested
with fascia. This cord ends in the internal
abdominal ring. It is accompanied by the vas
deferens, the excretory duct of the testis (a
continuation of the epididymis), which passes
through the ring into the pelvis to the base of
the bladder, where it unites with the duct of
the vesicula seminalis to form the ejaculatory
duct, which terminates in a slit-like orifice in
the prostatic portion of the urethra. Underneath
the tunica vaginalis is the tunica albuginea,
or fibrous covering of the testicle, and beneath
this coat is the tunica vasculosa, or vascular tunic,
composed of a plexus of blood vessels, united
by delicate areolar tissue. The glandular-
lar structure of the testis consists of from 250
to 400 lobules, each composed of from one to
three or more minute convoluted tubes, the
tubuli seminiferi. These tubules unite into
larger tubes, which carry the seminal fluid
from the testis to the epididymis.

The testicle is subject to hypertrophy, atrophy,
injuries, acute or chronic inflammation,
cystic diseases, fibroma, malignant disease and
neuralgia. Inflammation of the testicle (or-
chitis), as that of the epididymis (epididymitis,
q.v.), is usually attended with much pain
and swelling and a feeling of weight and great
discomfort. The use of a properly fitting sus-
pensory bandage affords much relief; but the
treatment of diseases or disorders of the testicle
should be entrusted to a physician. (See also
Spermatozoa). The removal of both testicles
renders a man impotent—a eunuch. Castra-
tion is the surgical operation of removing the
testicles, and is performed on horses, steers,
etc., to render them more docile and tractable.
It is generally recognized that castration re-
duces the will power and interferes with various
brain functions.

TESTIMONY, in general, the evidence
given by a witness orally in a legal proceeding;
from the Latin testimonium (testimony);
teslis, a witness. It may be secured during a
trial in court, or before a duly authorized com-
mmission. Although commonly so used "testi-
mony" is not synonymous with "evidence"
which is of broader significance and may in-
clude papers marked in a proceeding. Testi-
mony is usually deducted through questions
asked directly by counsel which may be fol-
lowed by cross-examination and redirect ex-
amination. (See Evidence). Consult Wellman,
F., 'The Art of Cross-Examining' (New York
1903); Wrottesley, F. 'The Examination of
Witnesse in Court' (London 1910, rev. ed.).
TESTIMONY, Psychology of. Applied psychology recognizes three groups of problems bearing on certain evidence in law. These deal with the part of a witness, the possibility of learning if he is concealing important facts; and the mental condition of the accused. Both lawyers and judges understand that differences in evidence given when both perception and memory are concerned do not necessarily imply dishonesty. Payton shows that individual differences may be expected and that by carefully comparing the effect of such differences a fair amount of accuracy may be attained. By carefully questioning observers of an enacted scene it has been found that errorless reports are an exception, that a narrative form gives greater accuracy and that both range and accuracy in reporting increase with practice and may be thus made nearly perfect. The reaction experiment has given excellent results but still lacks perfection. If it is desired to learn whether the mind of a witness or accused person is normal, the usual mental tests may be applied with good success. See CRIMINOLOGY; SULLIVAN, H. C. 'Criminal Psychology' (Boston 1911); Jung, C. J. 'The Association Method' (in American Journal of Psychology, Vol. XXI, Worcester 1910); Münsterberg, H., 'On the Witness Stand' (New York 1908); id., 'Psychology, General and Applied' (New York 1914); Whipple, G. M., 'The Observer as Reporter' (in Psychological Bulletin, Vol. VI, Baltimore 1909).

TESTING, in chemistry. See ANALYSIS.

TESTING MACHINES. Testing machines are employed to determine the physical properties of metals, and other materials such as cement, used for engineering and structural purposes. They are used especially in the testing of steel. The prime requisite of a material to be used in engineering operations is the property termed "strength," which is its capability to withstand the action of forces that may be applied to it in various ways so as to produce tensile, compressive, bending, shearing and twisting strains. Very often the force applied is a combination of two or more of these strains or stresses, and the metal is called to meet the tests of abrasion or wear. Physical tests are of two general classes — those made to determine the suitability of a grade of material for a particular purpose, and those by which the effects of differences in chemical composition, and different methods of manufacture, on the properties of the material, are studied scientifically.

The most satisfactory method that may be employed for this purpose is to actually load a specimen of the material under test and gradually increase the load up to the breaking weight, and observe the effects thus produced. Such a method, however, is too slow and cumbersome, since the loads required for even the simplest commercial tests are very seldom less than 50,000 pounds, and loads ranging from 150,000 to 250,000 pounds are commonly used, and make the direct application of weight impracticable in most cases. Therefore, various machines have been devised by which any load, from the smallest that is perceptible to the subject, to the breaking load, may be readily applied and its weight accurately determined.

Of these are two general types — those by which the specimen is loaded by hydraulic press, and those employing generally combined with a train of straining, rupturing or crushing pieces without injury to the machine, while measuring or weighing the strains, is the testing machine, which has frictionless weights, weighing heads, and is large enough to test the strain of important materials. Its disadvantages are due to the difficulty of keeping the load filled with a suitable liquid, the difficulty of keeping the packing of the plungers in order and the intermittent application of load by the strokes of the pump.

In both types the load is applied in a way that it acts through some form of machine which enables the operator to determine instantly the weight of the load amount of the force being applied.

The general construction of the machine is shown by the accompanying diagram. The Kiehl machine, which may be used to subject a suitable specimen of the three classes of strains — direct, direct compression and the transverse bending, so that the weight of the load can be accurately determined. Referring to the illustration, the open sliding head (a) may be moved up or down the two screws (bh) which are operated by power derived from any convenient source transmitted by belts on the pulleys (cc) of the machine, which are loose on their shafts, and be driven with a cross belt on one and an on the other side in opposite direction. Each lever (d) actuates friction clutches (e) and the motion of the pulleys with its shaft is communicated to the gearing and thus raises or lowers the head (a). By using the lever (f) and the wheel (g), the clutches may be so combined as to give various speeds to the sliding mass, which may be required in different classes of The stationary head (x) is supported by guides which rests upon the platform of the scale. The weighing beam (l) carries a movable counterpoise which works on rollers along the beam, but (m) operates a screw or chain which is the top of the beam and enables the operator to bring the counterpoise in line with the weight of the loading to be determined.
poise out along the beam gradually as is increased and thus observe con-
weight of the load being applied. In the poise may be arranged to be
advised and in side as shown in Fig. 5. The set is then drawn down by the screws, null on the specimen presses the stand-
the head (g) down upon the platform of
and causes the weighing beam to rise, pression test, the specimen is placed
platform of the scale and the sliding
lawn down upon it. In a transverse
test, the specimen is placed on two

standing close to each other.
er somewhat resembled the back of a,
and served to shelter the men from
rom above. The name was
 a structure movable on wheels
rs for protecting sappers in under-
defenses of an enemy.
ANUS, a disease characterized by
some or all of the voluntary muscles.
s vary in rigidity, and strong ex-
ns attend their recurrence. Tetanus
oxemia, and occurs in several varie-
most familiar of which is lockjaw
, whence it is commonly called by this
he disease in all its forms (tetanus ne-
uerperal tetanus, idiopathic, trau-
 rheumatic tetanus) is caused by the
bacillus, which was discovered by
84. Kitasato cultivated it in
bacillus in a slender rod, roust-
xing in surface soil, dust, manure,
as a rule occurring singly except in
It lodges in some wound, often a
unnoticed wound, and the produc-
de disease is always a proof of its
Exempt from this rule, however, is the bacilli not pass beyond the point of infection
into the body. The real nature of the tetanus poison has not yet been determined, but its
virulence is deadly in the extreme, and it is rapidly absorbed by the body in which it has
found lodgment. It is carried through the body in the blood.
In milder cases the spasm of tetanus may be
localized in certain muscles. Various the-
tories regarding the action of the poison have
been held by pathologists and the satisfactory
explanation is still being sought by specialists
in bacteriology and toxicology. Following
childbirth, tetanus may infect both mother and
child, and the average death rate from this
disease, always high, is especially so among
children. Surgical operations are sometimes fol-
lowed by tetanus, but antiseptic surgery has
doubtless lessened its frequency, and among
diseases it is regarded as rare. Within about
10 days after an injury resulting in the infec-
tion, it sets in, the muscles along the
neck and those of mastication being usually
first affected. The patient can neither mastic-
ate nor freely open his mouth. Often the
progress to general rigidity of the muscles is
very rapid, and convulsions of extreme viol-
ence ensue. Respiration is arrested and death
is often caused by this suspension. In other
cases it results from spasm of the glottis,
or from exhaustion produced by the violence of
spasms.
There is no satisfactory treatment of tet-
anus, but such as physicians adopt is both local
and general. Nothing is more important than
careful cleansing of wounds, however slight,
for precautionary purposes. Antitoxic disin-
fectants must be used, capable of destroying
the poison produced by the bacilli as well as
the bacilli themselves. Iodine solutions should
be thoroughly applied to every tetanus wound.
Potassium bromide, chloral, calahar bean, mor-
phine and antimony produce good results, and
opium and chloroform are employed for their
quieting effects. Amputation is sometimes re-
sorted to. Increase of fluids in the body by
drinking or by intravenous injection, and the
increase of diuresis aid in eliminating the
poison. Antitoxin serum (see SERUM THERAPY), prepared from the blood of
the immunized horse, has proved a true remedy
for tetanus, and many cures have been affected
by its early administration. Preventive meth-
ods, especially those of inoculation, are now
receiving the earnest attention of specialists.

TETON MOUNTAINS, Wyoming, a very
high and rugged granite range on the west
side of Jackson Hole south of Yellowstone
Park in the northwestern part of the State.
The highest peak, Grand Teton, is 13,747 feet
above sea-level. It is 17 feet higher than Fre-
mont Peak and 38 feet lower than Gannett
Peak of the Wind River range, the latter the
highest point in Wyoming and the northern
Rocky Mountain region.

TETRACHORD, in music, a scale-series
of four notes. The word in its present use
signifies a half of the octave scale. The fundamental system in ancient music was the tetra-
chord, or system of four sounds, of which the extremes were at the interval of a fourth. It	was superseded by the hexachord. See Music.

TETRACYMITE, a native bismuth tellu-
rude, often containing some sulphur and a trace of selenium. It occurs in pale steel-gray, met-
talic, foliated masses, in scales or more rarely in small rhombohedral crystals. It is soft	and gets marked paper, its hardness being 1.5 to 2; while its specific gravity is high, 7.2 to 7.6. It occurs in Austria, Sweden and various localities in Virginia, North and South Car-
olina, Georgia, Arizona and Montana. It is also called telluric bismuth.

TETRAGRAMMATON, a Greek term	meaning "the word of four letters," and applied to the sacred Hebrew name of the Deity. It was considered improper to pronounce the divine name, and, therefore, an abbreviation of four letters was substituted, the most fa-
vorite being Y H W H," which occurs 3,800	times in the Masoretic text of the Bible. The true name of God was uttered by the ancient	Jewish priests only during worship in the temple. On the day of atonement the service required the high priest to pronounce it 10 times; but it was held to be impious to pronounce the sacred name promiscuously, hence this tetra-
grammaton "Y H W H" came to be pronounced by readers as Ya be, Ia be, Yave, Yahm, Iae, Yah, etc. For some reason it also became cus-
tomary to mark paper, its hardness being 1.5 to 2; while its specific gravity is high, 7.2 to 7.6. It occurs in Austria, Sweden and various localities in Virginia, North and South Car-
olina, Georgia, Arizona and Montana. It is also called telluric bismuth.

TETRAHEDRITE, or GRAY COPPER,
a common and valuable ore of copper and silver. It is essentially a copper sulphantimon-
ite, differing from tenanteite into which it passes by insensible gradations only in the pre-
ponderance of antimony instead of the arsenic which distinguishes the latter. Its color and streak are usually steel gray; it often has a brilliant metallic lustre; its hardness varies widely from 3 to 4.5; its specific gravity is also quite variable, being from 4.6 to 5.1 in ordinary tetrahedrite, 4.5 to 5 in the argentifer-
ous varieties (freibergite), 4.7 to 5.03 in the mercurial varieties (schwartzite). It crystal-
lizes in the isometric system and owes its name to the fact that its crystals are invariably of tetrahexagonal form. It occurs at many localities in Austria, Germany, Eng-
land and Colorado, and is very widely distributed in massive form in copper and silver mines all over the world.

TETRARCH, tē-trárk or têt-rák (Greek
tetraark), a term which meant the ruler of one-
eighth of an empire or of a country, as it was applied by the Romans to subordinate princes with
territories, especially in Palestine and other parts of Syria in the early Christian period. The sons of Herod the Great, Philip and Herod Antipas, who reo	the lesser shares of his realm, were tetrarchs, while Archelaus, who received the principal portion, had the title of ethnarch.

TETRAZZINI, Luise, Italian soprano Florence, 1874. While yet a child she per-
formed several operas and her sister (afterward wife of Campanini) on the operatic stage. She studied at the Liceo Musicale in Florence and after but three months had made her début in "L'Africaine" in 1893, the part of "Irene." She afterward sang in several Italian cities and her continental successes were so great that she was called second Patti. Finally she made such a success at Covent Garden that Oscar Hamme	secured her in 1908 for the Manhattan House in New York. Her operatic career was continuous and she made a number of successful concert tours. As a singer she was noted for a voice of phenomenal power and great flexibility, coupled with unequaled technical perfection. See a coloratura soprano.

TETUAN, tē-tōo-ân', Morocco, a town on the northern coast of Africa, 33 miles east of Tangiers. It is defended by a fort. It is the only open port of the country on the Mediterranean, and has a short distance of Gibraltar. It is well built and many of the handsome private residences are the homes of Moorish exiles from Spain. The town is surrounded by flourishing gardens, groves and orchards. The Hebrew merchants carry on a large trade in fruit, wool, silk, girdles, leather and cereals. Provisions are exported to Ceuta.

TETZEL, tē-tzēl, or TEZEL, J.
agent for papal indulgences in England about 1453; d. there, August 1519. He was ordained toward the end of the 15th century. He soon began to appear in public as a preacher and gained a great reputation for his orational gifts. When in 1514 Leo X issued a proclamation granting an indulgence to all who would contribute to the building of Saint Peter's at Rome, Tetzel was selected to preach those provinces subject to the jurisdiction of the archbishop of Mainz. Luther was one of those against this indulgence who were answered by Tetzel and the decision of Wittenberg burned the annulling market place. Tetzel himself received a severe reprimand from the papal court who was sent to settle the dispute. Indicted at Rome from the charges which had been brought against him, he died in prison in the Dominican Convent. His life has been the occasion of a controversy owing to the part he took in the break of the Reformation, but recent investigation has shown how much to rehabilitate his character. His life has been written by C. H. M. (1840); by Körner (1880), and by K. H. G. (1883).

TETRYL. Tetryl is an explosive substance having the formula NO₂C₃NO₂, whose structure is tetryl azide or preferably trinitrophenylamine.
Another common name in use for it is prepared by dissolving lime in sulphuric acid and treating this with nitric acid. Pure tetryl looks like a yellow tint. It fuses at C. and solidifies at 128.7°. Its heat of combustion is 40.8 calories. It is more powerful in TNT or picric acid but more sensibly so. It is used as reinforcement for detonators, as the explosive core of a booster for high explosives and as a component of some nitrate explosives such as Foster, and is costly for general use. It is some-

sonous, producing an irritation of the

TEUTONIC LANG UAGES. The Teu-

tonic, or Germanic, languages are unmistakably of a common origin. They comprise English, German, Frisian, Flemish, Danish, Norwegian, Icelandic and Gothic. The latter prevailed from the 4th to the 7th centuries A.D. over a large portion of the south-west and southeast of Europe, and in it we find the oldest written documents; however, both the Goths themselves and Gothic are now wholly extinct. German again includes both High and Low German, with their varying dialects, often differing very materially in their structure from each other. All these tongues, though deriving as they do from a common source, have differentiated greatly in historic times, so much so that most of them are quite unintelligible to the members of the other branches. Again, as far as written records are concerned, these date from very different periods. Thus, we know the Bible translation of Bishop Ulfilas (Wolf) of the Ostrogoths, parts of which in a fair state of preservation are kept in the University Library of Upsala, Sweden, and dating from the 4th century. This trans-

translation manifestly shows that Gothic even at that early time was a highly articulate language. Anglo-Saxon literature takes its rise in the 7th century, though some earlier fragments are probably incorporated in later works. The earliest German records date from the 9th century. In that of the Dutch from the 9th century. Frisian, a subdivision of certain very marked characteristics, does not become known to us by as much as a line till the 12th century, and in that century, too, the Scandinavian tongues for the first time make an appearance in preserved records, though it is not till the 15th century really that much of this is visible. Not until the last-mentioned period, either, do Swedish, Danish and Norwegian begin to contrast sharply in their interior construction and phonetics. Icelandic went its own course, on the other hand, being little influenced, by reason of geographical remoteness, by the cognate tongues further south. However, these northern idioms are at least rich in comparatively early inscriptions, in Runic characters, and afford much food to the philological searcher. Likewise both inscriptions and other early literary remnants discovered in the northern lands exhibit all the various stages of develop-

ment, back even to a few types (like Icelandic).
more archaic and rude than Gothic and dating from as early as the 3d century A.D. Moreover, some deductions as to the general style of the various early Teutonic dialects spoken by those tribes with whom the Romans came into contact from a. e. 150 to about a. d. 350 may be drawn from that of another group of Teutonic chiefs and other men of prominence, as these names were usually emblematic and compounded of descriptive adjectives or nouns, and these would show that on the whole during these 500 years the Teutonic vernaculars were fairly constant and not subject to rapid changes.

Certainly, the Germanic languages stand out clear and well-defined as a separate group of the Indo-European family, their nearest relationship being, in some respects, with the Italic and Celtic, in others with the Slavic tongues, and forming part of the western division. Most characteristic for the Teutonic idioms, from the philological point of view, is their manner of using the Indo-European explosive sounds, which were lost or new consonants injected; n, for example, was eliminated before the s; final explosives and nasals were thrown out; their vowel system was in a general way a close assimilation to that of our vowels, as also our consonant sounds. The accent in the Teutonic tongues shifted, after remaining indeterminate for ages, to the first syllable. This must have been as early as a. e. 100. Alliteration was employed in a great deal, both in ordinary prose and in poetry, and this as far back as the time of the Cerausci, during the Augustan era of Rome. Alliteration also served to distinguish leading families or tribes from each other, the letter s, for instance, serving the Scambri as a special mark of this nature. It was similar in the case of other Teutonic idioms. The phonetic characteristics, too, seem to have become fixed about the beginning of the Christian era. Dialectical differences existed even then, but were not nearly so pronounced as they have become since, a fact which the most ancient Runic inscriptions emphasize. On the whole, the Teutonic languages in their most primitive forms with which we are acquainted were more melodious than in full verse and not so overburdened with consonants as we find them now. Gothic, which at a very early stage became separated from the body of the language by reason of far wanderings and long-continued influences exercised on it by the adjoining and surrounding Latin and Greek populations, underwent a number of important emphatic changes. So much so indeed that after the lapse of some three or four centuries of this influence Gothic, as spoken both by Ostrogoths and Visigoths, as also by the Vandals, Goths and other eastern Teutonic tribes, must have become scarcely intelligible to their kin who had remained on Germanic soil. This becomes reasonably certain by comparing the literal translation of Úfbola with contemporaneous specimens of German or Scandinavian. The latter two linguistic bodies, however, seem to have undergone their greatest internal alterations during the 6th and 7th centuries A.D. The vernacular of the Vandals, Goths and other eastern Teutonic tribes seriously differed from the Gothic. As for the chief parts of the early Germanic grammar, of the three numbers in vogue in Indo-European languages, the dual does not seem to have been used in the Teutonic idioms. In cases taken over from early Ar-}

TEUTONIC ORDER—TEWFIK PASHA

more archaic and rude than Gothic and dating from as early as the 3d century A.D. Moreover, some deductions as to the general style of the various early Teutonic dialects spoken by those tribes with whom the Romans came into contact from a.e. 150 to about a.d. 350 may be drawn from that of another group of Teutonic chiefs and other men of prominence, as these names were usually emblematic and compounded of descriptive adjectives or nouns, and these would show that on the whole during these 500 years the Teutonic vernaculars were fairly constant and not subject to rapid changes.

Certainly, the Germanic languages stand out clear and well-defined as a separate group of the Indo-European family, their nearest relationship being, in some respects, with the Italic and Celtic, in others with the Slavic tongues, and forming part of the western division. Most characteristic for the Teutonic idioms, from the philological point of view, is their manner of using the Indo-European explosive sounds, which were lost or new consonants injected; n, for example, was eliminated before the s; final explosives and nasals were thrown out; their vowel system was in a general way a close assimilation to that of our vowels, as also our consonant sounds. The accent in the Teutonic tongues shifted, after remaining indeterminate for ages, to the first syllable. This must have been as early as a.e. 100. Alliteration was employed in a great deal, both in ordinary prose and in poetry, and this as far back as the time of the Cerausci, during the Augustan era of Rome. Alliteration also served to distinguish leading families or tribes from each other, the letter s, for instance, serving the Scambri as a special mark of this nature. It was similar in the case of other Teutonic idioms. The phonetic characteristics, too, seem to have become fixed about the beginning of the Christian era. Dialectical differences existed even then, but were not nearly so pronounced as they have become since, a fact which the most ancient Runic inscriptions emphasize. On the whole, the Teutonic languages in their most primitive forms with which we are acquainted were more melodious than in full verse and not so overburdened with consonants as we find them now. Gothic, which at a very early stage became separated from the body of the language by reason of far wanderings and long-continued influences exercised on it by the adjoining and surrounding Latin and Greek populations, underwent a number of important emphatic changes. So much so indeed that after the lapse of some three or four centuries of this influence Gothic, as spoken both by Ostrogoths and Visigoths, as also by the Vandals, Goths and other eastern Teutonic tribes, must have become scarcely intelligible to their kin who had remained on Germanic soil. This becomes reasonably certain by comparing the literal translation of Úfbola with contemporaneous specimens of German or Scandinavian. The latter two linguistic bodies, however, seem to have undergone their greatest internal alterations during the 6th and 7th centuries A.D. The vernacular of the Vandals, Goths and other eastern Teutonic tribes seriously differed from the Gothic. As for the chief parts of the early Germanic grammar, of the three numbers in vogue in Indo-European languages, the dual does not seem to have been used in the Teutonic idioms. In cases taken over from early Ar-
Tewksbury — Texas

Arkansas, was established in 1877; Saint Rose of Lima Academy is in Texas; Texarkana Industrial College opened in 1904. There are excellent banking facilities and good newspapers. The majority of the inhabitants are American born; about 650 foreign born and 4,200 of negro descent. Pop. (Ark.), 1,898 (1880) 3,528; (1900) 4,914; (Tex.), 1,890, 2,852; (1900) 5,256. Since 1900 the cities have grown considerably and the United States census of 1910 showed the population to be about 9,790; the 1918 estimate is 12,500.

Texas, the most centrally located of the southern tier of the United States, is much the largest of the Union and is popularly known as the "Lone Star State." It is bounded on the southeast by the Gulf of Mexico, on the east by Louisiana, on the east and north by Arkansas, on the north and east by Oklahoma, on the west and north by New Mexico and on the southwest by Mexico. It lies between lat. 25° 51' and 36° 30' N. and between long. 93° 30' and 106° 40' W., and extends, therefore, east and west nearly 800 miles, north and south nearly 750. Its land area is 262,400 square miles and its coast line nearly 440 miles. According to United States census estimates it had a population of 4,700,000 in 1919 and a total wealth of $6,859,909,141 in 1912. Texas is divided into 252 counties and is a political but not a physical geographic unit. The State was admitted into the Union in 1845, having been for 10 years previously an independent republic.

Topography. — The general surface slopes upward fairly uniformly toward the northwest from sea-level to 4,000 feet and more. The Gulf deepens but slowly off shore and long barrier islands enclose along most of the coast shallow lagoons and bays whose total area is about 3,500 square miles. Padre, Galveston and Matagorda islands and Matagorda Peninsula are the longest of these barriers. Dredged channels aided by jetties allow large vessels to enter Galveston and Corpus Christi bays and Sabine Lake. The southeastern and eastern third of the State is quite flat but is diversified by very low hills along its northwestern boundary which rises to 500 feet or 600 feet above sea-level and which is marked toward the south by the Balcones Scarp and toward the north by the White Rock Scarp. The middle third of Texas is mainly level or nearly level country, but is marked by numerous hills which chiefly in the southwest, cluster thickly enough to make large areas of rather rough contour. Except for the Trans-Pecos region west of the Pecos River, the northwestern third of Texas, rising northwesterly from sea-level, is about 2,000 feet on the east to 4,000 feet on the west, is a part of the almost level great plains, but is cut more or less toward the east by the head streams of the larger rivers. West of the Pecos and nearer the Rio Grande, upon a plateau with an altitude of 3,000 to 4,000 feet, rise the Guadalupe, Franklin, Quitman, Davis, Organ, Chinati, Chisos and other mountains. Two peaks considerably exceed 8,000 feet and 18 are higher than any east of the Mississippi. The mean elevation of Texas is 1,700 feet.

Rivera.— As a consequence of the northwesterly rise all the rivers flow in a general southeasterly direction. The Canadian and the Rio Grande, with its tributary, the Pecos, rise
in the Rockies outside Texas. The Red, the Brazos and the Colorado rivers rise on the Staked Plains. The Sabine, the Neches and the Trinity rise in the northeast, the Guadalupe, the San Antonio and the Nueces rise in the central part of the State. The Canadian and the Red rivers are parts of the Mississippi River system. The other rivers discharge into the Gulf along the Texas coast, all except the Brazos emptying into bays which they are siltting up. Owing to slight and irregular rainfall over their upper drainage areas, the larger rivers are not well adapted to navigation, nor do the streams in general afford much constant water power. The Rio Grande divides Texas from Mexico, the Red and Sabine rivers dividing Texas partially from Oklahoma, Arkansas and Louisiana.

Geology.—Archeozoic rocks are represented only in the Llano, Van Horn and El Paso regions where, and in the Marathon region, limited exposure of Cambrian and Ordovician strata are to be found. Scarcely any Silurian and Devonian rocks have been discovered. In north central Texas, Car}-boniferous strata estimated to contain 8,000,000 tons of bituminous coal and a vast quantity of recently discovered petroleum outcrop over an area of 13,500 square miles. West of the coal-bearing area the Permian Red Beds outcrop over 25,000 square miles. The Jura-Trias system is unimportant, outcropping only along the scarps of the Staked Plains. In the Trans-Pecos region are lesser outcrops of the Cretaceous, Permian and Jura-Trias. Exception being made of the Llano region and the Permian-Carboniferous areas, the middle third of Texas from the Rio Grande to the Red River is covered by Upper and Lower Creta- ceous areas in the proportion of two to five. The long Balcones Scarp marks a fault which divides the Upper Cretaceous on the east from the Lower on the west. The Eocene and Pleistocene, separated by a narrow Oligocene and a Miocene-Pliocene strip, occupy all of south central Texas and on the eastern edge of Texas east of the treeless areas. Many of the Basin Range type; basaltic outbursts are to be found widely but sparsely scattered through the southern Upper Cretaceous. In the Llano region vast masses of granite are exposed. Some 20,000,000,000 tons of lignite are estimated to lie in the Eocene Beds. The marine Neocene of the Coastal Plain contains immense petroleum deposits, but petroleum has also been found in large quantities in the Eocene, Cretaceous and even the Carboniferous. Over a thousand square miles of the Eocene are some easily accessible beds of good limonite.

Climate.—The lines of equal rainfall run nearly north and south, the rainfall diminishing from 55 inches in the east to less than 10 inches in the west. The average for the State is 33 inches. Variations from annual averages are common and very wide departures from monthly averages are almost the rule. Evaporation steadily increases from 45 inches at the east to 90 inches at the west. Obviously Texas ranges from humid to arid. Eastern Texas has about 60 per cent of the sunshine. The mean annual temperatures from 55° (35° in winter, 75° in summer) extreme north (Panhandle country) to 76° in winter, 84° in summer) in the extr. Over most of southern and eastern Texas the mean summer temperature is about 81°. Temperatures of 95° are not infrequent, the extremes being 115° and -16°. In winter temperatures at Amarillo and Brown ville differ by 24°, in summer by 9°. H temperatures are much modified by the evaporation and by the Atlantic trade which blow regularly through the area, are frequently interrupted in winter or oppositely directed northerly which blow great violence, sending the temperature sometimes as much as 50° in a few hours. Snow and freezing occur along the coast during the severer northerly and winter day or so. The climate on the lakes is healthful.

Flora.—The large size, varied rain temperatures of Texas unite to produce a variety of plants and animals. A trace of Canadian Life Zone is to be found on of the highest western mountains, lower down by more abundant species of the Transition Zone. The Staked Plateau of north and irregular strip extending to Kerr County, and most of the Trans-Pecos above 4,000 feet are in the Upper Sonoran. The remaining nine-tenths of the State is in the Lower Austral (cotton producing) Zone. The western and larger half of the Lower Austral is Lower Sonoran, the rest is Upper Sonoran. There is a semi-tropical Gulf S. of the Lower Austral as well as arid and arid areas in the Lower Sonoran. Cotton, palmetto, hickory, magnolia, osage orange, sycamore, willow, holly, and loblolly pine abound in eastern Elms, pecans, cottonwoods and willows, the streams with oaks, cedars, hackberry mesquite, etc. In the Texas east of the treeless areas. Many of the cacti, especially the prickly pear, grow in the Lower Sonoran area. Wild flowers abound species and individuals. The various grasses are largely supported by industry.

Fauna.—Prairie dogs, jack-rabbits, ground squirrels, skunks, rats and mice are the commoner animals. The coyote and mule deer, protected by law, are taming their numbers. The wild buffalo and the antelope, bear, panther and puma are nearly as abundant. Armadillos are common south. A great majority of the North American species of birds have been found in Texas. Characteristic and common birds are the Arizona Jay, mockingbird, lark, red bird, meadow lark, swallows, doves, and turkey hawks. The wild turkey is rare. Thirty varieties of lizards and snakes are known. The horned toad is the most interesting native reptile.Monitor lizards and coral snakes and the rattler, black, pilot, coachwhip and many others are widely distributed. There is a variety of fish in the lower coas where small alligators are still fairly common.

norly Gulf fauna abounds off the coast as a consequence. Very fine fishing is to be found for tarantulas, centipedes and large red insects. A most commonly noticed inversion is that of the sand from the beach.

**Nature and Stock Raising.** — Although a decreasing percentage of the population goes on these industries is still 60 per cent of the male workers. The value of (28,000,000 acres) of the State to crops each year, the remaining 40 per cent of the total furnishing pasture for the beef cattle numbering nearly 450,000 is nearly doubled and the improved range is increased 50 per cent since 1890. Prairie of the Upper Cretaceous is densely populated farming region, but in Red Beds, and the Eocene and the Cretaceous. Large bodies of varicose soil are common. The picture of the landscape is usually colorful and fruitful, with the thousands of contest for the prides of the Texas Industrial College. The census of Texas in about three times the State average in 1910, $962,000,000, or $2,219,000,000. In 1910, has nearly 1900 and has quinquennial since that time. The total value of the annual cotton crop was $200 and 350 millions of dollars, near a sixth of the world's rice production is two-thirds of the total. Values of the cotton, sugar, and tobacco of about 100,000 acres. The production of sugar has decreased, the fruit and the sugar industry. The fruit crop consists of about 200,000,000 pounds, and the value of the cotton crops is about 5,000,000,000 pounds.

The chief crop in Texas is cotton, about equal in the other crops combined and raised. In 1912 the crop is far, 4,820,000 bales, and the value of the annual cotton crop is 200 and 350 millions of dollars, fluctuating about a sixth of the world's rice production. In Texas the acreage irrigated for cotton, 100,000,000 bales. The production of sugar has decreased, the fruit and the sugar industry. The fruit crop consists of about 200,000,000 pounds, and the value of the cotton crops is about 5,000,000,000 pounds.

The cotton crop consists of about 200,000,000 pounds, and the value of the cotton crops is about 5,000,000,000 pounds.

**Irrigation.** — Plants fall into two fairly well-marked divisions: (a) numerous small plants widely scattered but chiefly in the west, which use the water from rivers, springs and waterholes to raise a wide variety of crops, and (b) large plants, chiefly the lower parts of the rivers, which irrigate thousands of acres under one management and sell water to individual farmers. In the southeast these large plants are almost exclusively raising cotton. Along the Rio Grande they raise everything but rice. The Elephant Butte Dam on the Rio Grande in New Mexico above El Paso is the only United States reclamation project directly affecting Texas where it will irrigate about 100,000 acres. Perhaps 5,000,000 acres in Texas are irrigable. About a million acres are under ditch and 600,000 acres irrigated annually, half in rice. Most of the water is pumped to the fields, the total capacity of the pumps being over 6,000,000 gallons per minute. Rice irrigation on a large scale is only 15 years old and the average irrigated for other crops has quinquennial since 1900. Farms irrigating for rice numbered 73 in 1900 and 1,088 in 1910; farms irrigating for other crops numbered 1,252 in 1900 and 4,500 in 1910. The most profitable crops in Texas small irrigating plants have existed for centuries. Irrigation development has been particularly rapid since 1910 in the lower Rio Grande Valley but has not been without its setbacks. The recently finished Medina Dam near San Antonio renders 60,000 acres irrigable. Between Hereford and Lubbock lies an area where irrigation water may be obtained from shallow wells. Similar but small areas exist elsewhere. There is an Artesian Belt in South Texas and various wells are sources of water for domestic uses.

**Mining.** — This industry is making great progress. The production of petroleum, which practically began at Corsicana in 1895, owing to the discovery of the first well in 1901 and of other great fields in the succeeding years, has increased immensely but...
has been subject to considerable fluctuations. In the last two years the production of the older coastal and north Texas oil fields has increased and immense quantities of oil have been found in the central carbonate region. Production leaped from 27,644,605 barrels in 1910 to 60,000,000 barrels in 1919. Oil and gas prospecting has been going on vigorously, stimulated by frequent successes. The production of most of the other minerals has had a slow but fairly uniform growth. In 1914 the total mineral production was $30,363,426, including 20,068,184 barrels of petroleum at $14,942,848; 2,247,773 tons of coal and lignite at $3,922,459; 12,433,639 M. cubic feet natural gas at $2,460,770; 2,100,341 barrels of cement at $1,947,016. Clay products, lime, gypsum, cinnabar, salt, sulphur and various other minerals amount to the remaining $7,081,333.

Manufacturing.—Since 1900 the "value added by manufacturing" to the Texas raw products has nearly trebled. In proportion to population, in 1900 Texas manufactured a sixth, in 1915 a fourth, as much as the United States as a whole. Manufacturing has arisen chiefly in response to demands made by the immense raw products, but has been retarded by scarcity of fuel and skilled labor. The major manufacturing industries are naturally based upon the major raw products. The large cotton crop supports nearly 4,000 gins (some very large) and 200 cotton-seed oil mills but only 20 cotton spinning establishments. Flour, grist and rice mills handle the entire crop of cereals but canning and preserving are far behind the opportunities offered by the large fruit and vegetable crops. There are a few large meat packeries slaughtering close to 1,500,000 animals a year. A few large petroleum refineries with a total capacity of 250,000 barrels per day are handling also much Oklahoma and Louisiana oil transported by pipe lines. The lumber area in the east, chiefly southeast, over 50,000 square miles upon which there is an estimated stand of 40,000,000,000 board feet of yellow pine and 20,000,000,000 hardwoods, supports about 400 sawmills and 400 other woodworking plants. About 2,000,000,000 feet of the yellow pine is being cut, but the hardwood cut is scarcely 5 per cent of this amount. The major industries just listed include about two-thirds of the total manufacturing which, in general, is of a kind that involves only simple processes which may be done by machinery.

The manufacture of bricks and other clay products is widely and numerously scattered. Much ice is made in every town. No distilled spirits are made and no wool or mohair is woven. Dallas is second only to Nashville as a Southern publication centre. Dallas and Houston are somewhat ahead of Fort Worth and San Antonio as manufacturing places. The important manufactures of Dallas are cotton gin machinery, meat packing, flour and grist milling, cotton-seed oil and cake, leather and printing. In Houston, meat packing, rice cleaning, railway car repairing and brewing are the chief industries. Fort Worth leads in meat packing and flour milling, San Antonio led in brewing. In these four large cities a third of the total manufacturing is done. Of the wage earners, 6 per cent are women, 2 per cent are children under 16 years.

The 1914 United States census states Texas manufacturing are as follows:

- Number of establishments
- Persons engaged in manufacturing
- Primary horse power
- Capital
- Sales
- Value of finished products
- Value added to raw product by manufacture

Statistics for those industries in value added by manufacture was in $1,000,000 are as follows:

Cement, confectionery, sheet metal goods, artificial gas, leather and mine are the other chief manufactures; added by manufacture in each case is approximately $1,000,000.

Transportation.—Before the C&St less than 500 miles of railway were 1919 there were over 15,800 miles in not including 4,200 miles of side track way building was greatly promoted by grants until the public lands were in 1882. The leading systems are the Pacific (mileage, 3,000), the Gould Sub including the International and Great and the Texas and Pacific (mileage, 2,000) and the Texas and New Mexico (mileage, 1,500). The Railroad Commission has authority to and otherwise to control intrastate traffic. The issuance of railway bonds is strictly controlled. Texas and New Mexico own the steer half again as much per inhabitant thirds as much per square mile as the States as a whole. Numerous steam connect Galveston with the great world. Some 500 miles of interurban miles of urban electric lines are in From $10,000,000 to $15,000,000 are b each year upon the roads.

Commerce.—Cotton lint is the principal export, exceeding in value all other exports combined. Most of this cotton goes via Houston and Galveston. In order the other chief exports are cotton-seed products, cattle, lumber, mules, rice, wool and mohair. The chief machinery, clothing, vehicles, and a wide variety of other manufactured goods. Pork, sugar, potatoes and other foodstuffs are imported in considerable amounts. Strong efforts are being made to reduce such food importations by increasing the amount of crops which can reduce such food importations by consumption about balance, cotton

2 The Mission San José, near San Antonio, built in 1718
from the count. This lint produces a
of of trade in favor of Texas of over
0,000 a year. Galveston is one of the
principal ports of the world; her imports
ports are mostly but not exclusively of
duty-free, and originate mainly in the

Banking.—Law and public opin-
ning governmental banks, private banks,
of which are still flourishing, prevailed
865 when the first national bank was
red at Galveston. In 1918 there were 12
banks at Dallas. The total capitaliza-
tion of these banks is above $35,000,000; the
surplus is above $20,000,000; the total de-
are over $200,000,000. A State bank
went into effect in 1905 under which 900 State banks have gone into successful
on. Their total capitalization is over
1,000, their surplus is over $12,000,000,
postits are about $105,000,000. De-
are protected either by a binding sys-
by a State guaranty fund maintained
ments on the banks collectively. Ten
ul banks have deposits in excess of $4,
1 each; 10 State banks have deposits of
1,000,000. Each of these banks, known as
preponderant bank. Interest rates are
other high, kept up by rapidly rising land
large business profits and by other
government.—The present constitution
2 in 1876 and has not been extensively
ed since. The chief elective officials are
vernor, attorney-general, treasurer, com-
er of the general land office, superin-
t of public instruction and commissioner
ructure, together with three railroad
ssioners. The chief officials appointed by
vernor are the secretary of state, adjun-
geral, three penitentiary commissioners
 other officers whose duties relate to
ce and banking, taxes, revenues, public
State purchasing, game, public buildings,
ines, pure foods, reclamation of lands,
s, fires and masonry inspection. The
ry is elective. In ascending order there
ate and Municipal Courts, County Courts,
t Courts, each with one judge or presid-
cial. Above these are nine Courts of
peals above which are the Court of
al Appeals and the Supreme Court.
of these higher courts has three judges
 in rotation every two years for six-
. The legislature meets biennially
of a senate of 31 members elected
ly every two years for four-year terms
ouse of 142 members elected for two-
rs. There have been numerous called
. The State is divided into 41 United
judicial districts and into 16 Congress-
Of the 18 congressmen two are there-
elected at large. Voting is restricted to
21 who have paid the poll tax and
ed one year in the State and the last
months in the district in which they live or
is to be done. The old convention
of selecting officials has been largely
ed by the general primary. The salaries
officials are not large. The govern-
ment of Texas, however, is on a scale that is usual
other States and he controls a consider-
mount of patronage. He appoints nearly
40 State boards and a two-thirds vote of both
house and senate is required to overcome his
vetto. In general the county is the local unit
of government. Spanish influence has caused
some civil law to be incorporated into the
common law. Law and equity are not dif-
erentiated, common-law forms of pleading
have been abolished, and a Penal Code and a
Code of Criminal Procedure dates from 1856.
Texas has been the pioneer in adopting the
community property system in exempting the
homestead from liens, in the commission form
of city government, in the regulation of rail-
way stock and bonds, in the regulation of farm
tenant rents.
State Finances.—In 1915 the total assessed
valuation was $2,755,171,793, upon which was
levied a total State ad valorem tax of 55 cents
on the $100. This tax, together with charter
fees, poll and occupation taxes, etc., produced a
total revenue from taxation of about $13,240,
000. To this should be added $2,140,170 aris-
ing from the State Permanent School Fund of
nearly $68,000,000. The university and the
Agricultural and Mechanical
College possess endowments derived, like the
Permanent School Fund, from the sale of
State lands set apart for the schools in early
days, which yielded an income of about $260,
000. Expenditures were as follows: State de-
partments, $1,633,505; judiciary, $1,057,197;
eleromosynary institutions, $2,863,876; Con-
ederate pensions and homes, $1,558,171; mis-
cellaneous, $262,821; higher education, $1,754,
077; public schools, $7,999,059. Income and ex-
penditures are increasing at least 3 per cent a
year. Of the ad valorem tax of 55 cents, five
cents is specifically set aside for Confederate
pensions, 20 cents for the public schools. The
State debt is negligible, but the total debt of the
 COUNTIES exceeds $30,000,000; of the cities it
is about $60,000,000. County tax rates are
 general under $1 on $100 but in some cases the
city rates reach $2.
Education.—To the $7,999,059 spent by the
State on the public schools in 1915 should be
added $6,387,866 raised by local taxation in counties,
districts and cities and $518,628 derived from
local sources. Per Pupil School Funds, similar to the State Permanent
Fund, and amounting to nearly $13,000,000. On
about 1,100,000 children of free school age
Texas spent in 1915 about $14 per child. There
are nearly 25,000 teachers, of whom scarcely
1,500 hold college degrees, of whom about 3,000
hold certificates that would admit to normal
 colleges. The rural schools are open scarcely
six months per year. There is such pressing
need of improving rural education that the
legislature of 1915 appropriated $1,000,000 for
the purpose and it is probable that this amount
will be increased in future. A compulsory
law now going into effect will cause a much needed
improvement in attendance. The high schools,
between 500 and 750 in number, are of very un-
equal merit but are improving fairly rapidly.
The training and the salaries of teachers are
increasing. The value of the public school
buildings exceeds $30,000,000. Receipts from
sales of school building bonds were $2,847,591
in 1913, the amount collected by local taxation
for redemption and interest on bonds was
$1,719,682. There are numerous private second-
ary schools. The native white illiteracy was 6.1 per cent. in 1900. 4.3 per cent in 1910; of negro illiteracy 24.6 per cent in 1910, 85.6 per cent in 1900.

The State normals at Huntsville, Denton, San Marcos, Canyon City, Commerce and Alpine for whites and at Prairie View for negroes. The Girls' Industrial College is at Denton, the Agricultural and Mechanical College (which has income from the United States and from other sources not enumerated above) boys at Bryan, the University of Texas is at Austin with the exception of the medical department which is at Galveston and a school of mines at El Paso. These State higher schools, whose total enrollment, regular session, exceeds 8,000 are almost wholly supported by biennial legislative appropriations. There are nearly 50 private and denominational colleges of various grades, with an attendance in excess of 14,000.

Charities and Corrections.—Three insane asylums, with a total of 4,000 inmates, are located at Terrell, Austin and San Antonio. There is an epileptic colony at Abilene; a blind institute, a deaf, dumb and blind institute for negroes, a deaf and dumb institute, a Confederate home, a woman's Confederate home and a farm colony for feeble-minded are at Austin; an orphan's home is at Corsicana; a juvenile training school for boys is at Gatesville and for girls at Gainesville; a tuberculosis sanitarium is at Carlsbad. In addition to these State-maintained institutions there are numerous denominational and private hospitals and retreats of various kinds. The State penitentiaries, containing usually from 4,000 to 5,000 inmates, are at Rusk and at Huntsville, and, mainly through farming, are designed to be self-supporting, but have in recent years created large deficits.

Religion.—Accurate recent statistics do not exist. The best approximations are as follows: Baptists, 490,000; Catholics, 375,000; Methodists, 375,000; Presbyterians, 85,000; Disciples of Christ, 60,000; Lutherns, 35,000; Protestant Episcopalians, 20,000; Jewish, 15,000; all other denominations, 45,000. Most of the negroes are either Baptists or Methodists. Other approximate church statistics are as follows: ambuches, 9,500; church organizations, 12,500; Sunday-school teachers, 65,000; Sunday-school pupils, 600,000; value of church property, $27,000,000; seating capacity of the churches, 3,000,000; church debts, $1,350,000. The Y. M. C. A. and Y. W. C. A. hold property worth $1,700,000.

Population.—The first United States census taken was that of 1850 when the population was 212,592. In 1870 the population was 818,579; in 1890 it was 2,255,523; in 1910 it was 3,823,471. The rate of increase was about 85,000 a year. Native white Americans form 73 per cent of the population. 51 of this 73 being native white Texans. Foreign born Europeans number 3 per cent, Mexicans 7 per cent, negroes 17.7 per cent (20.4 per cent in 1900). A large German element in the population of South Texas dates from 1846. General Texas is Southern in type and Southern in habits and of the West. The occupation percentages for the male workers (who number about 1,330,000 in 1915) are: Agriculture and stock raising 60 per cent; manufacturing and mining, 14 per cent; trade and transportation, 15 per cent; professions, 3 per cent; all other occupations 8 per cent. White farm tenantry and the percentage of women at work are increasing. The towns are increasing much faster than the country, 68 per cent as compared with 19 per cent during the last census decade. The five largest cities increased 107 per cent. Only 19 per cent of the people live in towns of more than 10,000 population. Sixty-six per cent of the population is rural. According to the estimates of the Southern M. S. Institute University at Dallas and the Rice Institute (endowment over $10,000,000) at Houston, together with the much older Baylor University (Baptist) at Waco, Southwestern University (Methodist) at Waco, Texas Christian University at Fort Worth, have passed 100,000. El Paso is near 50,000 and Galveston 40,000; Austin, Waco and Beaumont have passed or are nearing 20,000. Between 10,000 and 20,000 are San Angelo, Parmer, Brownsville, San Angelo, Paris, Texarkana, Caddo, Palestine, Tyler, Wichita Falls, Corsicana, Castor, Christ and Greenville.

History.—The first explorers were Spaniards, Cabeza de Vaca, 1528-36, and Francisco Vasquez de Coronado, 1540-42. Other Spanish gold hunters traversed the State occasionally during the next 140 years but it was not till 1662 that a still-existing Indian pueblo under Spanish auspices was found at Ysleta near modern El Paso, 200 years younger. La Salle, driven west by a storm while searching for the mouth of the Mississippi down which he had sailed, three years previously, built in 1685 near Matagorda Bay, a fort which was soon destroyed by the Indians. Four Frenchmen found refuge among the more peaceful Tejas Indians who, as a result, have the tribal name perpetuated as "Texas." Alarmed by this accidental and unexpected invasion, the Spaniards of Mexico established in 1690 the Mission San Francisco de los Tejas, near modern Nacogdoches, but this far-away mission was soon abandoned. Later various other scattered missions and forts were established, but in 1800 those at San Antonio, Nacogdoches and Goliad were the chief results of over 200 years of Spanish colonization. San Antonio, begun in 1718, became in 1730 the first civil European settlement in Texas. The first civil European settlement in Texas begins in 1821. The Spaniards having failed to settle the country, three abortive invasions between 1800 and 1821 by Anglo-Americans were shadows of coming events. In 1821 Mexico, finished successfully her war of independence begun with Spain in 1810; in 1821 the United States gave up a claim to Texas arising from the purchase of Louisiana from France in 1803; in 1821 Moses Austin obtained permission to locate 300 American families but, dying, his son Stephen de in March 1830 established the beginning of an American settlement at San Felipe de Austin on the lower Brazos River in December 1822. During the next 15 years probably 30,000
TENNESSEANS came to Texas, settling mainly along the coast between San Antonio and Nacogdoches. They came, not because, as has sometimes been alleged without evidence, they specifically to extend the slave-holding area. For real Mexican, they practically governed themselves and formed no close or ties with their adopted country. A Mexican republic resulting in 1824, and Coahuila became one state divided the departments of Saltillo, Monclova and Revolucion and disorder prevailing in Mexico, when Santa Anna established here a dictatorship in 1835, the American the declaration of a provisional government in favor of a union with the radicals together with a restoration of Mexican independence in 1836 and 1845 Texas was independent republic, a unique experience of the States of the Union. In 1845, Texas was an ally of the United States, retaining all her lands and the right to subdivide into five States. Claims to a portion of Mexico were abandoned later for which were used to pay the debt to Mexico had accumulated. The annexation of Texas brought on the war between the United States and Mexico which was Rio Grande an international boundary. In 1874, Texas was not the scene of any military operations; Federal troops attacked the public and spread further. In 1884, the control of the usual type of constitutional government was not completed until 1874 when Gov. E. J. Davis was removed from office.

1874 Texas has been Democratic by majorities. The carpet bag constitution was replaced in 1876 by the constitution in force. In 1874 the Texas Ranger State was organized to protect the frontier from Indians. The debt of the Texas administration was paid during the civil war. Coke Hubbard and Roberts handled the matter of rapid spread of barbed wire and the rapid spread of barbed wire. The old Capitol burned down in 1881. The most important studies in civil was the day that in 1892 when Governor fought and won a hotly-contested election in which resulted in the establishment of a strong commission with large powers and a strong commission with large powers and arrested the alien ownership of land. Prohibition, first voted on in a State election in 1887, has since been a much-fought issue. At present all of the people live under well-enforced local option laws. In 1896 the United States Supreme Court ruled finally the laws of Texas by awarding Greer County in the forks of the Red River to what is now Oklahoma. Texas from time to time has suffered from river floods and from tropical storms along the coast. At Galveston in 1900 thousands of lives and much property were lost in a storm. Out of this calamity grew the Galveston Sea Wall and the commission form of government. The supremacy of the Democratic party, threatened for a few years by Populism before the Democrats adopted free silver in 1896, shows no signs of failure. The political problems now before Texas are the development of a more efficient system of public schools, the reduction of farm tenantry, compulsory investment of life insurance funds in Texas securities, abolition of the fee system of paying county officials, penitentiary reform, reforms in legal procedure and better public roads.

PRESIDENTS OF THE REPUBLIC

- David G. Burnet, ad interim 1836
- Sam Houston 1836-38
- Mirabeau B. Lamar 1838-41
- Sam Houston 1841-44
- Anson Jones 1844-46

GOVERNORS OF THE STATE

- J. Pinckney Henderson, Democrat 1846-47
- George T. Wood 1847-49
- P. Hansborough Bell 1849-53
- James W. Henderson (acting) 1853
- Eliza M. Pease 1853-57
- Hardin R. Runnels 1857-59
- Sam Houston, Independent and Unionist 1859-61
- Edward Clark (acting) 1861
- Francis R. Lubbock 1861-63
- Pendleton Murrah 1863-65
- Intergovernment 1865
- Andrew J. Hamilton, Prov., appointed 1865-66
- James W. Throckmorton, appointed 1866-67
- Eliza M. Pease 1867-70
- Intergovernment 1867-70
- Edmund J. Davis, Republican 1870-74
- Richard Coke 1874-76
- Richard B. Hubbard 1876-77
- Oren M. Roberts 1877-79
- John Ireland 1879-83
- Lawrence B. Ross 1883-87
- James S. Hogg 1887-95

H. Y. BENEDICT, Dean, University of Texas.

TEXAS, The University of, the head of the public school system of the State, is located at Austin, except the medical department at Galveston and a loosely connected school of mines at El Paso. The first step toward its establishment was taken in 1839 when the Congress of the republic set aside 40 acres for a campus in the future city of Austin and 50 leagues of public land as an endowment. In 1858 the legislature increased the endowment by adding $100,000 of United States bonds and lands amounting to 10 per cent of all the public lands granted to railroads. The constitution of 1876 replaced this 10 per cent by 1,000,000 acres, to which the legislature added another 1,000,000 in 1883. The university was finally organized in 1881, located by a popular vote and opened to students in 1883. Since that time the Agricultural and Mechanical College had been opened and although vaguely made a branch of the university by the constitution of 1876, has existed separately under its own board of directors. From its 2,000,000 acres, which are in West Texas and leased to cattlemen, the university has an income of nearly $170,000; fees and interest on $60,000 derived chiefly from land sales amount to about $50,000 more. The annual appropriation for running expenses from the legislature for 1919-20 is $950,000. The constitution prohibits the use of legislative appropriations to pay for buildings, and the act establishing the university limits the matriculation fee to $30, admits men and women on equal terms and prohibits any sectarian instruction or religious tests for officers or students. The government is in the control of a board of nine recents appointed by the governor with the consent of the senate, three every two years for terms of six years. The departments of the university are (1) the college of arts, (2) the department of law, (3) the department of engineering, (4) the department of medicine, including pharmacy and nursing, (5) the department of education, (6) the agricultural department, (7) the summer school and normal school, (8) the department of extension, (9) the bureau of economic geology and technology. The B.A., B.S., M.A., Ph.D., L.L.B., L.L.M., C.E., E.E., M.E., and M.D. degrees are conferred. Provision is made for taking the B.A. and L.L.B. in seven years, the B.A in four years. Twelve courses, somewhat elective under a system of grouped studies, are required for the B.A. Fourteen and one-half years of high school must be completed for admission. Additionally the department of law requires a minimum of 30 college courses, the medical department also requiring 30. The L.L.B. requires three years, the M.D. four years of nine months each. The summer school offers during the summer session of three months as many as possible of the courses of the regular session. In addition to the older collegiate subjects, courses in journalism, home economics, business administration, music and art are offered. The usual college clubs, fraternities, associations, fellowships and scholarships abound, and an unusually broad system of student government prevails, accompanied by the honor system on examinations. The campus at Austin is surrounded by churches and an association of religious teachers give courses which are allowed to count toward the B.A. At Austin are the Main, Law and Engineering buildings, the library, two dormitories, a power house, a chemical laboratory and about 25 small cheap frame buildings which growth has necessitated and which are used for various purposes. At Galveston are the Medical College building, the five buildings of the John Sealy Hospital, a dormitory for women and a course of home study. The library has over 150,000 bound volumes, including a number of rare first editions. The laboratories are well equipped. There are various funds, mostly small, and numerous special collections. During the regular session of 1915-16, 3,100 students were in attendance. An addition 500 other individuals were in the summer school, 500 in the summer normal and 700 doing correspondence work. The attendance has more than doubled since 1909. The regular faculty numbered 180 in 1916-17 and 350, the affiliated high schools nearly 300. Most of the Texas colleges officially use the affiliated list of the university.

TEXAS AGRICULTURAL AND MECHANICAL COLLEGE, located at College Station, Brazos County, Tex. It was established in 1871, receiving as an endowment 180,000 acres of land from the National government, in accordance with the Morrill Land Grant Act of 1862. Opened for the reception of students 4 Oct. 1876. The government of the college is vested in a board of nine directors, appointed by the governor for terms of six years. It offers 11 four-year courses leading to the degree of B.S., as follows: Agriculture, architecture, architectural engineering, chemical engineering, civil engineering, electrical engineering, general engineering, mechanical engineering, military engineering, textile engineering. A four-year course in veterinary medicine leading to the degree of D.V.M. is also offered. Two-year courses in agriculture and engineering are provided for students with limited preparation, who are over 18 years of age. Graduate work in agriculture and engineering is also provided. The college farm and grounds, covering 300 acres, of which 750 are under cultivation; the grounds and buildings in 1916 were valued at $2,000,000: in 1915 and 1916 buildings to the value of $375,000 were erected, including a hospital, an assembly hall, a veterinary building, a stock judging pavilion and a steam plant. The library in 1916 contained 25,000 volumes; the enrolment for 1915-16 was 1,415, the faculty 103.

TEXAS BLUEGRASS. See GRASSES IN THE UNITED STATES.

TEXAS CHRISTIAN UNIVERSITY, located at Fort Worth, Tex. It was founded in 1854, as a private institution in Thorp Springs, Tex., in 1875, and chartered under the name of the A.D. College in 1890 the college became the property of the Christian Church of Texas, and in 1895 was moved to Waco, Tex., and the name was changed to Texas Christian University. In the spring of 1910 the college was burned at Waco, and it was moved to Fort...

ICATION, ELEMENTARY.

TEXTILE DESIGNING. This term is r the designing of textiles in which the is obtained in the weaving and not by ent printing. The simplest patterns are ses and checks. By running 5 or 10 ts and 5 or 10 gray threads alter-

n the warp, stripes would be made. If e thing was done also with the weft or a checkered pattern would result. In ng a pattern the designer first considers ght of cloth desired and calculates what thread or “yarn” he needs and how t threads there will be to the inch. He bases his design on the inch. Having mae knowledge of the loom harness, determines the arrangement of the or “weave,” he knows its limitations t what combinations are practicable. If

he uses a plain weave, in which the threads interlace alternately, it is very easy to design checks and plaids. He may decide to use the twill, in which the shuttle carries the woof-threads over one and under two or more warp-threads. By carrying this twill principle a little further, he may produce a diagonal cloth. If he is dealing with silk, and wants a glossy surface, he may decide on a satin weave, which reduces the number of crossings of warp and weft, permitting a close texture and a glossy finish on one side. Some successful designs de-

fine largely the stability of the cloth, for users judge a fabric mainly by the effect at first sight. The patterns must be harmonious or with artistic contrasts to please the various tastes. To sell at certain prices, they must have definite weights per yard, as buyers of large quantities will require 10, 12, 14, etc., ounces to the yard. The designing of silk, linen, wool and other fabrics involves many differences, which must be thoroughly under-

stood. And carpet and rug designing is a different business, requiring complete knowl-

edge of their manufacture. The designers of rugs try to imitate the higher priced hand-made rugs from the Orient, and often succeed admirably. Consult Beaumou, “Colonial in Woven Design” (new ed., 1912). See WEAVING.

TEXTILE INDUSTRY. American.— In 1800 there were no textile mills, as the term is now understood, in the United States. Whatever the American people did in the way of manufacturing their own clothing was mostly done in the household; the spinning wheel and the handloom were utensils as familiar in the old-fashioned kitchens as the pots and kettles of the housewife. The homespun garments worn by our forefathers were fashioned out of wool grown on the home farm, carded by hand,

ards, washed in tubs, spun and woven by hand, fulled and finished at home, cut up and sewed — all by the joint labor of husband, wife, sons and daughters. The finer clothes worn in those days were all imported; and as the colonies grew and multiplied, and the cheapness of English textiles increased, the manufacturers of the mother-country foresaw a wondrous new market opening up before them. The desire to retain and increase that market for textiles, in the manufacture of which England already led the world, was far more prominent among the causes leading up to the American Revo-

tion than its historians have yet discovered.

Colonial Homespun.— The homespun garments of colonial days were plain, and wore like iron; their ingredients were indicated in the name commonly applied to the cloth — “linsey woolsey.” It was a fabric of woolen weft, woven on a linen warp. Linen was much more commonly produced in the household than cotton fabrics, and wool was more in use than all other fibres combined. Cotton was a scarce commodity in Colonial America until long after the Revolution. It possessed a value equal to that of wool, and sometimes very much higher. What little of it was used prior to the 19th century was mostly imported from Barbados. When Samuel Slater started the first American cotton mill at Pawtucket, in 1793, he insisted upon using cotton from the Indies, because of the poor quality of the cotton then raised at home. No one dreamed, when the “Shipping
TEXTILE INDUSTRY

and Commercial List and New York Price Current first made its appearance, that America was destined to become the cotton-producing country of the world; nor did Slater's little mill of 250 spindles, which had then been in operation five years, give signs that it was the germ of an American industry which would consume annually within 100 years more cotton than all the world was then growing. The history of the textile industries during the colonial period, as recorded in tabular form, to a large extent, the development which confronts and amazes the student at the opening of the 20th century, who finds them, with their subsidiary industries, employing more capital and creating a greater value of annual product than any other group, except iron and steel.

Expedients of the Colonists.—Our forefathers realized how important it was that the colonists should learn to clothe themselves. They resorted to all sorts of expedients, some of which were state socialism to overcome the difficulties in the way. They offered bounties to increase the number of sheep and promote the growth of flax. In Massachusetts laws were passed making it compulsorily, to each family, a certain quantity of yarn every year, under penalties of heavy fines. Gradually the household textile industries assumed an importance which alarmed the mother-country, and the Lords of Trade attempted, by various restrictive orders to prevent and harass a development which threatened to destroy the colonial market for the chief products of British industry. Parliament passed an act in 1774 — which was shortly after the Arkwright inventions had inaugurated the modern factory system — forbidding the exportation, under heavy penalties, of any of the machines used in the cotton, silk, woolen or linen manufacture. This statute, which remained in force, with certain modifications, until 1845, was evidence of a puerile hope that the English people could keep the fruits of inventive genius bottled up in their little island, while England permitted her sons to carry their inventive ideas across the water.

First Woolen Factory.—Slater brought here, by the use of power-driven machinery, in the same way Arthur Schofield, three years later, invented the first wool-carding machine, which he built and put into operation at Bifield, Mass., in 1794, thus fixing the date of the beginning of the factory manufacture of wool by machinery operated by power in the United States. American machinists and inventors did the rest. It is not to be denied, however, that the English statute did regard, embarrass and make trebly difficult the early development of our textile factories.

Steps of Evolution.—It would be interesting to follow the evolution of the household industries by slow and gradual steps, into the highly developed ones of today. First came the neighborhood fulling-mill utilizing the friendly services of the adjacent stream, and relaying the housewife of the labor of tulline and finishing the clothes and blankets according to the last during the long winter months. Then the carding-machine was added to the fulling-mill; the farmers for miles about brought their wool to be converted rolls ready for the spinning-wheel. If Slater had successfully applied the Arkwright invention to the spinning of cotton a few years later, the woolen mills gradually appeared which spun both wool and linen by water power. Hosiery were still used in all these mills 1813, when the invention of a power-loom by Francis C. Lowell led to the building of his Waltham cotton factory by the Boston Manufacturing Company, and the American mill first took on the characteristics which since increasing distinguished it. Power and weaving machines were rapidly applied to the manufacture of woolens, and it can be seen that the household manufacture of textiles was disappearing before the general economy and efficiency of the factory system. The transition was not rapid, and the upswings of our first textile mills were numerous and discouraging.

War of 1812.—The outbreak of the War of 1812, and the non-intercourse acts and embargoes which preceded it, were the most potent factors in completing the transition. The total restriction of imports spun a golden web upon their own resources for their entire clothing. Cotton and woolen mills, quickly built. High prices and the promise of quick fortunes drew many men with little knowledge of manufacturing into the labor. All went well enough until the war ended; a fallowed collapse and ruin. The work of building the solid foundations of textile manufacture had all to be done over again. Improved and woolens again invaded the market; a rush, and the domestic manufacturers felt it impossible to compete with them either quality or in price. Labor was unskilled and cheap; knowledge and experience sadly wanting; machinery was clumsy and inefficient; the country was poverty-striken, trade, and the national finances more demoralized.

First Protective Tariff.—Then first was the great battle in Congress, by which was made more or less intermittently ever since, for the protection of the domestic industries by means of tariff laws. The Tariff Act of 1816 — the first of the series in which the principle of protection was recognized in the rates as a distinct purpose of the law, conjointly with the raising of revenue — was much more favorable to the cotton than to the wool manufacture, because it applied the minimum prior to cotton cloths, which was in effect a duty of 6½ cents a yard, while the simple valorem rate of 25 per cent was applied on woolen goods. From the date of the law the cotton manufacture began a healthy development, and it naturally grew much faster than the wool manufacture. The later were much more delicate, complicated, and exacting in their methods and operations. The Tariff law of 1816 was like a rule, more favorable to cotton than to woolens; partly owing to the fact that cotton was a more rapidly growing industry, and to the fact that the woolen manufacture has at all times except during the Civil War shown a greater prosperity than the whole a more rapid development than the sister industry. But in both industries many years it was an up-hill struggle.
TEXTILE INDUSTRY

Few fortunes were made; many, and the courage and tenacity of those textile manufacturers deserve to be remembered.

1850.—In the last half of the 19th century, there was an increase in the value of about six times, and not less than if it were possible to measure this quantity instead of by value. Even so, figures would not be so numerous that they have completely transformed the modus operandi of textile mills throughout the world. These mechanisms are more generally used to-day in the best American textile mills than in those of any other country. So far as mechanical equipment is concerned, our best mills, whether cotton or woolen, are fairly equal to the best in any foreign country. It does not follow that textile manufacturing is done here, as a rule, with equal economy in cost.

Mills and Equipments.—In structural equipment the modern American mill is in some respects superior to the average foreign mill. It is not so massive a structure, nor so solidly built, brick being used here, while the English generally use stone; but in the lightness and airiness of its rooms, in economy of arrangement and in general completeness of equipment and care for the comfort and convenience of the operatives, it is usually superior. The lesson is fast being learned by our textile manufacturers that in these days of close competition and small profits successful manufacturing requires that buildings shall be of the latest design and the most approved management, and that machinery shall not only be modern in design, but made in the most perfect condition by constant renewal. Many parts of the machinery required for the equipment of our textile mills are still necessarily imported from England, because not made, or less perfectly made, in the United States. Our machine manufacturers have been advancing as rapidly in recent years as the textile mills themselves, and the time cannot now be far distant when every new mill built in America will be equipped throughout with American-made machinery. The United States shows a firm grip and exports have reached beyond the million dollar mark. Textile machinery in 1914 was being made in 241 establishments valued at $30,437,689. In that year machinery was exported to the value of $13,083,048.

Variety of Fabrics.—The American textile mills now supply practically every variety of fabric made in the world, with the exception of linens and the very finest grades of other fabrics. Great sums of money have from time to time been invested by daring manufacturers in constructing plants for the manufacture of linen fabrics. The result has often been disappointment and failure. These obstacles are still formidable, but the flax being a fibre which requires more moisture than any other for its successful manipulation. Again, there is difficulty in obtaining a home supply of suitable raw material. Years of high protection have failed to persuade the American farmer into growing flax for fibre. The history of the linen manufacture in other countries seems to establish the fact that it is the one textile manufacture likely to remain segregated in a few

had ever been woven by power looms in any country until it was done by George Crompton at the Middlesex Mills in 1840. Every carpet ever woven was woven by hand. In 1785, Erastus Brigham Bigelow revolutionized the industry. Beyond these fundamental machines the American mechanisms for expediting processes, for automatic devices, for dispensing with intermediate help, have been so numerous that they have completely transformed the modus operandi of textile mills throughout the world. These mechanisms are more generally used in the best American textile mills than in those of any other country. So far as mechanical equipment is concerned, our best mills, whether cotton or woolen, are fairly equal to the best in any foreign country. It does not follow that textile manufacturing is done here, as a rule, with equal economy in cost.
localities like Holland and Ireland, where the fibre is grown on the spot, where the climate is peculiarly adapted and where the help has acquired an experient born of generations of experience. Moreover, the one textile the consumption of which has not appreciably increased with the growing perfection of textile machinery. The other fibres, less difficult to handle, more susceptible to cheap manipulation, continually encroach upon its territory.

Silk Industry. Perhaps the most striking contrast to our experience with linen is that afforded by the silk manufacture. At first sight it would appear that this must be the particular textile industry which could not flourish in America. Since last century’s whirm of the speculative mania to cultivate the silkworm which swept New England in the thirties, and wrecked the fortunes of many too credulous farmers, we have settled down to the conviction that America cannot grow the silk to compete with China, Japan and Italy. Moreover, the silk manufacture, like the linen, has always been highly specialized and localized. The city of Lyons, in France, had well-nigh monopolized the manufacture, so far as it had escaped from the hand processes of the Eastern grain dress silks was then started, and at present time brocaded silks and satins manufactured on a large scale; indeed is no form of fabric into which silk is not now produced in great quantities. Especially noteworthy has been the development in the manufacture of silk and all varieties of upholstery goods. The of home-made silk goods was in 1880 just as equal to the foreign value of the goods shipped. In 1890 the production had grown so much that it was nearly double the value of the imports and more than double the value of the produce in 1830. During the next decade the rate of increase was accelerated. In Paterson is est silk-ribbon mill in the world. And in that city, an outgrowth of the little patented by John Ryle, covers an acre and a half and can nowhere be surpassed for size or completeness of equipment. See Silk and S Industry (History of the Industry in United States).

The consumption of raw silk in recent years is as follows (in pounds): 1914, 24,023; 1909, 17,290; 1904, 11,572; 1900, 8,705. Statistics of the silk industry are as follows:

<table>
<thead>
<tr>
<th>Establishments</th>
<th>Wages-earners</th>
<th>Capital</th>
<th>Wages</th>
<th>Cost of material</th>
<th>Value of produce</th>
</tr>
</thead>
<tbody>
<tr>
<td>1914</td>
<td>902</td>
<td>108,170</td>
<td>$210,072,000</td>
<td>$47,109,000</td>
<td>$144,442,000</td>
</tr>
<tr>
<td>1900</td>
<td>852</td>
<td>99,017</td>
<td>152,158,000</td>
<td>88,570,000</td>
<td>106,912,000</td>
</tr>
</tbody>
</table>

Other important statistics in the silk industry are the following: Amounts of spindles in Throwing (raw silk) in 1914, 677,900; 1904, 637,585; 1903, 624,680; 1909, 442,410; Spinning and Twisting in 1914, 2,023,391; 1909, 1,675; Spinning of Span Silk in 1914, 107,251; 1904, 130,547. Thrown and spun silk in 1909 amounted respectively to $1,394,032 and $1,213,493.

Cotton. In the textile industry King Cotton still maintains supremacy. And the United States holds a proud position among her low-nations. The industry has shown marvelous growth in the last quarter of a century, but the centres of production have shown a frequent reduction of output in individual mills while collectively the admirable increases. The first cotton mills were in New England but by 1860 the industry had spread into scattered sections shown by the following table which gives England 52 per cent of establishments and 37 per cent of spindles.

<table>
<thead>
<tr>

</table>

In this industry, for example, the Yarmouth, the mills were started in 1769 and the first cotton mill was built by the company. During the Civil War the high duties stimulated the silk industry and diversified its product.
TEXTILE INDUSTRY

New England industry was centralized in Massachusetts and Rhode Island, and these grouped largely at Providence, Fall River, Lowell and Manchester, N. H., also at and Philadelphia, the largest cotton

storing city. This before the Civil War the general technical growth up to 1860 and been briefly given above (more detailed machinery can be found under title) with its greatly improved machinery thus allowing larger output per man higher wages, and competition with imports. But the radical changes in the industry are shown by the following New England's 570 establishments in 1860 fallen to 308 in 1905, though the number of spindles had increased from 3,859,131,911,000 in those years from the 1860's smaller factories to lose ground and rapid growth of the more prominent already capitalized mills. Then came the mushroom-like growth of the Southern textile industry, the Northern cotton-mill owners of whose industry was threatened by spinning with its low-priced labor. 890 to 1905 we get the following statistics that show the advance of the North and the Southern mills maintained a healthy advance:

<table>
<thead>
<tr>

</tbody>
</table>

Cotton manufactures in 1914 were valued at $701,300,933; in 1909 at $628,391,813; in 1904 at $450,407,749; in 1899, $339,200,320. The equipment of spindles producing these outputs was in 1914, 30,887,499; in 1909, 27,425,608; in 1904, 23,195,143; in 1899, 19,050,052. These were used on the following number of looms (all classes): 1914, 670,661; 1909, 665,049; 1904, 559,296; 1899, 455,752.

Improved Spinning.—The improvements in spinning have been so rapid since 1870 that most of our large corporations have been compelled to replace their spinning-frames two or three times in that interval. A similar statement can be made regarding no other branch of textile manufacture; and it is probably true that if the American woolen mills had been forced, as the cotton mills have been, to abandon machinery as soon as it became in any degree obsolete, their ability to face foreign competition would be more nearly in keeping with that shown by our cotton manufacturers.

Large Corporations.—The conditions here narrated have thrown the cotton manufacture more and more into the hands of large corporations, which now almost universally conduct it. The wool manufacture, on the other hand, while it numbers some of the greatest corporations in the land, is still largely in the hands of individuals and partnerships, and the bulk of the mills are comparatively small in product of the Southern mills has been coarse yarn and cloth while the North maintained its hold on the finer goods, and reduces great output of coarse goods.

* Not including lace, tape, webbing and other cotton products, which give an added value of $44,183,931 for 1914; $36,936,069 for 1913; $26,454,297 for 1904, and $25,-297,385 for 1903.
TEXTILE INDUSTRY

capacity. The more recent tendency in the wool manufacture, for obvious reasons, is strongly in the direction of the corporate form of management.

Fine Cottons.—The quantity of fine cotton goods made in American mills continues to be very small in comparison with the whole product and in the bulk of consumption this class of cottons is still imported. So there is ample room remaining for further development of the American cotton manufacture. Into this field we are entering with characteristic Yankee energy. Within comparatively few years mills have been successfully established in New England which spin yarns as fine as Nos. 150 or 260; and there are mills at New Bedford, Taunton and elsewhere which make, in wonderful variety, fabrics as delicate in texture and as artistic in design and coloring as any which reach this country from the machine-using nations of Europe.

Wool.—The range of products made in American wool factories is as wide as the multifile uses to which this most valuable of all the fibres is put. They divide themselves naturally into four great groups, leaving the hosiery and knit goods out of the classification: woolen mills, worsted mills, carpet mills and felt mills. There are the various classes of classifications of spinning, weaving, dyeing and finishing mills, although, as a rule, all these separate processes of the manufacture of wool continue to be carried on jointly in this country, as the related parts of the one operation of manufacturing.

Specialization.—In the wool manufacture, as in the cotton and silk manufacture, we have many establishments which, in completeness of structure, in perfection of machinery, in the details of mechanical equipment, and in swiftness of management, are nowhere in the world surpassed. Indeed, it is only in this country that we find, on a very large scale, textile mills in which are performed all the separate processes for the manufacture of our various varieties of goods. Elsewhere they have learned that the greatest economy and the best practical results are secured by specializing the processes. Thus in Bradford, England, are enormous establishments which do nothing but comb wool into tops, either on commission or for sale. Other great mills do nothing but spin tops into yarn, and generally they confine their operations to a limited variety of yarns. Still others, buying their yarn, devote themselves exclusively to twisting, and in the middle of a fourth class of establishments take the woven goods and dye and finish them for the merchants, who are the men who find the ultimate market for all the specialists who have been thus employed upon the goods. In this specialization of the different branches of the work exists the characteristic distinction between the American and the foreign textile mills of today. Investigation appears to show that the English method is far superior, and that ultimately we must gravitate into the former, if we are to cut any figure in competition for the world's market. The manufacturer who devotes his whole energies to one particular thing, and studies to do that one thing as cheaply and as well as it can be done, can do it better and more cheaply than the manufacturer who is doing half a dozen different things at the same time. This is not a theoretical deduction, but an axiom founded upon prolonged experiment and experience. Bradford manufacturers who have tried both methods say there is always a gain in economy when the weaver buys his yarn, instead of spinning them himself. Obviously the English method requires a smaller investment, it secures a simpler and more perfect autonomy in operation, involves less waste and avoids the accumulation of superfluous raw material. The American woolen mill was evolved from conditions which rendered it impossible to attempt even to approach perpetually impossible. It was situated in some isolated spot, drawn thither by a superior water power, with no railroad to facilitate quick transportation, and was necessarily a complete mechanical entity, however crude its machinery. In a word, it must perform under

one roof all the processes necessary to convert the greasy wool into the finished cloth ready for the market. Thus there sprung up all over the country little woolen mills, each one independent in itself; as the country grew some of these little mills became large mills; other large mills grew up beside them; gradually grew centres in which the wool manufacture predominated; but conditions were long in appearing which tended to that specialization of processes which has marked the English method from the very introduction of automatic machinery. It followed that the American mill-owner, even of a small mill, was compelled to make a variety of goods, in order to use up advantageously all the grades of material which came out of the sorting of his wool. Naturally he could not produce a variety of products as cheaply and as successfully as he could have manufactured one particular line upon which his whole attention was cast. The habit of manufacturing, forced upon us originally by the logic of the situation, are tenacious.
TEXTILE INDUSTRY

The home market, and of which their production has been enormous. Many of these goods are woven upon a cotton warp, and into some of them enters more or less of the revamped wool known as ‘shoddy.’ We have much to learn, however, in the handling of this class of materials, before we shall equal the pertinence of foreign manufacturers.

Manufacturers in that city. The small of capital required to equip a little ed permits enterprise. The comparative cheapness of pro- under such conditions enables them to ir own against the big establishments mited capital at their back. American Woolen Specialties.—The bulk small wool manufacturing establish- the United States are woolen mills as distinguished from worsted mills. iceable that the number and product woolen mills decrease from census to s the worsted manufacture gets more stablished here, and the more popular fabric comes into wider use. But lines of woolen goods in the he of which American mills have world-wide pre-eminence. Prominent item are flannels and blankets of every d variety. The American wools are suited for these goods, and for many at our American mills have practically the home market. Other mills make of woolen dress goods for ladies’ th equal success. The bulk of our mills are, however, engaged upon the

 Worsted.—The worsted manufacture was late in getting lodgment in the United States and has been slow in assuming proportions commensurate with its importance abroad. Early in the forties there were two or three large worsted mills erected in New England for the production of worsted fabrics or stuff goods for women’s wear; but the manufacturer made little headway until after the close of the Civil War, and it was not until about 1870 that we began making men’s wear worsted goods. Since then the development of the manufacture along both lines has been phenomenal. In the manufacture of fine men’s wear goods, both in woolens and worsted, a few American mills have been equally successful; their products sell side by side with the best makes of foreign goods. Another obstacle is the high cost of labor, which counts more strongly in fine wool goods than in the cheaper grades or in cottons and silks, because of the much greater care and skill and labor that must be bestowed upon their finishing. Woolen goods are from carded wool, worsted from combed wool. The popularity shown to worsteds has resulted in a great growth in that class of goods, checking the advance of the manufacture of woolen goods as is shown by the following tables:

Felted Wool.—The manufacture of felted wool is comparatively small here and elsewhere and the importations are comparatively insignificant in volume. Felted wool was the earliest form into which this fibre was manufactured, the primitive races discovering, before they had
Textile Industry

learned to spin and weave, that peculiar characteristic of wool which causes it to mat together by the application of heat, moisture and pressure, into a firm and smooth texture, susceptible of a great variety of uses. Modern machinery has utilized this peculiarity for many purposes which, while limited, are economically important. Tablecloths and floor coverings, and hats for men's and women's wear, are the most ordinary; but they are also used for shoe linings, sheathing materials, polishing purposes, etc. The hat manufacture, formerly confined to wool for its raw material, has found that fur is better suited for this use; and the processes of manufacture are so different from those employed in spinning and weaving mills that the hat-manufacturing establishments, in which the United States has always been pre-eminent, are not ordinarily classed among the textile mills.

Carpets.—Perhaps our most notable achievement in the textile line has been in the carpet manufacture. Beyond question the United States is the greatest carpet-manufacturing nation in the world; if we leave out of account the hand-loom productions of the Eastern countries we excel all others not only in the quantity of our production, but in the variety of our carpets, in the excellence of design and workmanship, and in general adaptability to popular needs. The production includes twoply and three-ply ingrains, Brussels, moquettes, tapestries, velvets, Smyrnas and the highest grades of Axminsters and Aubussons. The annual consumption of this product by the American people begins to approach 100,000,000 square yards. The popular reason assigned for this unique development is the general prosperity of our people, the high wages earned permitting families of all grades of life to indulge in the luxury of floor coverings to an extent elsewhere unknown. Stimulated by the lucrative market thus offered, American manufacturers have made larger and more important contributions to the mechanism of the carpet manufacture than those of all other nations combined. The real development of the machine industry dates from the successful application of power to the weaving of ingrain carpets by the late Erastus B. Bigelow in 1834. Subsequently he invented Jacquard looms for weaving Brussels and Wiltons, which produced carpets pronounced by the jury at the London Exposition of 1851 to be "better and more perfectly woven than any hand-loom carpets that have ever come under the notice of the jury."

A still later invention of Bigelow's was for weaving tapestry carpets. His inventions are at the base of all the power-loom carpet-weaving now done in Europe. Subsequent inventors have greatly improved them and have added new inventions, such as those for weaving Axminsters and Smyrna rugs. By their skill and enterprise the American carpet manufacturers have not only retained the control of their own market, except in the matter of the Eastern hand-made rugs, but they have in some instances successfully forced their products upon the European markets.

In 1914 there were 97 establishments in the United States producing carpets and rugs of other than rugs, keeping 33,100 persons engaged; the wage-earners numbered 31,309 and were paid $14,715,615. Capital employed was $85,153,828. Jute carpets and rugs were to the added value of $1,172,277. Rag produced had a value of $2,799,439. Growth of the industry is shown by the following figures:

Hosiery and Knit Goods.—In one branch of the textile industry progress in United States has outstripped the world—hosiery and knit-goods manufacture. Most machine-made knit goods are turned out annually here than in all other countries combined. The explanation is somewhat as in the case of carpets. Our people wear more underwear than other people; they are not only obliged to wear more for climatic reasons but they can afford to wear more; and the general desire for personal comfort in wearing panty hose results in an enormous distribution of products of these mills. The beginnings of the industry are well within the lifetime of manufacturers still living, and until 1882 and 1883 silk stockings remained the only hosiery made. The only form of textile work which the machine had not wrested from the housewife. In that year Eberhard Eggers successfully applied the principle of knitting by power, at Cohoes, N. Y. His machine was simply the square stocking-frame of William Lee adapted to power. From that adaptation dates a revolution in underwear, which had previously consisted wholly of flannel, fashioned and sewed at home, according to the individual needs. The revolution gathered momentum gradually, as invention after invention—almost all of American origin—perfected the knit-machine; but once the new industry was fairly and firmly established, it spread with amazing rapidity. The great variety of goods made facilitates the tendency, peculiar to this industry, toward the building of comparatively small mills, requiring but moderate capital, and it happens in consequence that these mills spring
TEXTILE INDUSTRY

over the country and can now be found in every State. Many of them employ cotton as a raw material; others use chiefly and still others manufacture what are known as merino knit goods or mixed goods—mixed with wool in proportions varying 0 to 75 and 90 per cent of cotton, according to the particular market sought. The ever since, as the statistics show. One drawback has been the difficulty of getting the American agriculturist to grow a flax crop, in spite of placing a high tariff on the raw stuff to tempt the grower. Matters have, however, changed considerably already, the industry has obtained a firm foothold and the statistics show steady growth.

Statistics.—The value of all textile products in the United States for 1850 was $128,769,971 and this has increased to $931,494,566 in 1900. The census report for 1900 shows the following:

The number of cotton spindles in operation in 1900 was 19,008,352, as compared with 14,188,103 in 1890, and 10,653,435 in 1880. This striking increase is due in a large measure to the wonderful growth of the industry in the South since 1880, as before that date the cotton manufacturing industry existed there only on a most restricted scale. In fact, the growth of

The wonderful strides given in these figures for 1910-18, of course, reflect the consequences of the war cutting off Europe from her exports and the consequent enormous increase of our products in demand from South America and other foreign states.

Future Needs.—The American textile manufacturers have left little to be desired in the direction of cheapening textile products without deteriorating quality. They have built and equipped mills which rank with any in the world. They have planted on this continent machinery enough to supply all top in our wants of our people, except in a comparatively few lines of very fine fabrics. They have managed these mills with rare business sagacity, and as a rule with notable financial success. They have taken one specialty after another which had never been attempted here, and transported its manufacture from across the water, literally inventing anew the necessary machinery, as in the case of braids and plush goods, when they could not obtain it otherwise. They have taken these several textile industries, which have been localized and specialized in Europe for generations, and in less than a century have made them one of the chief corner-stones of our national wealth. They have contributed far more than their share to the mechanical development which makes the labor of a single operative stand for that of a regiment of hand-workers in the 18th century. They have fallen short only in contributing to the artistic development of the industry. They have been imitators instead of originators, although there are among them many striking and gratifying exceptions to this rule. But American-made goods do not bear, generally speaking, any distinctive artistic characteristics which distinguish them as American-made; and, generally speaking, they are inferior in this respect to the best products of foreign looms. All this is natural—natural to a new country in which utility everywhere predominates over the ornamental. The next great forward step in our textile manufactures must be in the artistic rather than the mechanical direction, for there we recognize its weakest point. In the designing of patterns, in the use and application of dyes, in the staple product, in bleaching and finishing, in fabrics the artistic element, to lift the manufacture into an art, our textile mills are still far from the top of the ladder. This deficiency is not in any sense peculiar to the textile industries. It is an educational difficulty in which our people as a whole may be said to share. It is incident to a crude country of limited facilities in art directions. What needs to be done is to supply more facilities.
in 1909 England used 39,000,000 mule spindles against 7,900,000 ring spindles. In 1909, England's output of woolen tissues (ool or mixed) amounted to 188,125,000 yards valued at $88,000,000. Her worsted textiles (all wool or mixed) were 209,109,000 yards valued at $86,653,000. Other products at year were:

In 1840 Germany had 638,338 spindles worked by hand 1860 to about 2,000,000. A report gave her 10,920,426 spindles for spinning. In Crefeld, the centre of Germany's silk industry, were last reports of factories making silk cloths and 28 es producing velvets. The total Ger- Ick product has been estimated at about $333.

According to the last statistics available had 7,500,000 cotton spindles. These were chiefly located, before the war, at Lille, x, Toucing, Epinal, Saint Die, and in the Paris area. They employed 12,000 power looms and 40,000 hand. Her woolen fabrics were chiefly produced at Lyons for high goods. Silks of fine quality were also at Saint Etienne and in Picardy. The industry employed from 85,000 to 90,000 wens on over 20,000 power looms. They produced 2,500,000 kilograms of wrought silk and 1,000,000 kilograms raw silk. Production follows:

in all about $86,361,000.

Foreign Schools.— England's textile operatives are supplied with technical training in such schools as Bolton Technical School, Bradford Municipal Technical College, Oldham Technical Institute, Halifax Municipal Technical College, Huddersfield Technical College, Keighley Institute, Yorkshire College at Leeds, Oldham Technical School, Rochdale Municipal Technical School, Salford Royal Technical Institute, etc. Germany has textile schools at Aix-la-Chapelle, Crewe, Cottbus, Falkenberg, Muhlheim-on-Rhine, Berlin, Chemnitz, Muhlan, etc. In France technical education for the textile industries is given at Elbeuf, Tourcoing, Roubaix, Saint Etienne, Lyons, Flers, Sedan, Bohain. In Austria are textile schools at Asch, Schoenberg, Warnsdorf, Ruthenberg, etc. In Switzerland are textile schools at Wattyl, Zürich, etc. In Italy we find such at Prato, Arguno, etc.

TEXTILE PRINTING. The decorating of fabrics by printing is one of the oldest of the arts. There are evidences that it was practised in Egypt 2000 b.c., and it was used in ancient Assyria, India and China. Opinions are divided as to the country of its origin, but it is generally agreed that the art is a memorial of the 13th century. They printed principally silks and linens, and were addicted to gilt and silver designs. In the course of time the art spread to Switzerland, France and England. The print works at Jouy, near Versailles, France, were the first to become famous. It is believed that fabrics were printed in England as early as 1620, but the first record of systematic manufacture was at Richmond-on-Thames in 1690. All this early printing was done from blocks by a method very similar to block printing for books. The designs were cut in the surface of a block, and if many fine lines were desired, the surface of the wood was cut away and thin strips of copper twisted and cut to the required form for the lines, and forced tight into the wood until the top of the copper was at the desired level. If a large solid surface of color was required, it was found better to surface the wood with felt, as it carried the ink better than the wood. That very beautiful results can be had by block printing on fabrics is evidenced by the fact that it is still practised by amateurs as a fad and by a few artistic workmen in large cities. Block printing was long done entirely by hand, the block being laid on the cloth being covered with felt or the like and impressed with a mallet or by rubbing. But presses for block printing became common in England in the 18th century and continued to be used long after the cylinder method of textile printing came into use. Sev-
er had the idea of printing with a roller, but Thomas Bell, of England, was the first to bring out a practicable cylinder machine, in 1783. His object was twofold, to print several colors at once and to do away with bad joints, which were all too common in block printing, wherever the pattern was repeated. In 1785 he patented a six-cylinder machine, which was the prototype of the modern cylinder cloth-printing machines. Though vastly superior, the invention was accepted slowly, and in 1840 it is reported that only 556 cylinder machines were in operation in Great Britain as against 14,000 tables for block printing. Engraving on the cylinders was for a long time tedious and expensive, the first radical improvement here being Gormetz's engraving machine in 1828. The pantograph machine for duplicating patterns on cylinders in enlarged size came in 1834, and thereafter the art of textile printing advanced very rapidly. The patterns or designs are now made on paper and transferred to the cylinders, and either cut into with the pantograph or etched on copper. They are also sometimes made in soft steel and later hardened. A modern cylinder textile press has a great central drum around which the cloth travels. About this drum are a series of engraved cylinders with inking apparatus. The cloth is led in from a reel and passes under perhaps six or eight cylinders, receiving a color impression from each, in exact register, and is then led to a drying apparatus, that is only an enormous reel, with adjustments for keeping the printed surfaces apart until quite dry. Commonly the colors are put on lightly for surface effect, and in other cases the color is forced through the cloth, so as to get an effect on the reverse side. Most exquisite printing is done on silks, linens, woolens and cottons, as can be seen by anyone who will visit the counters of any large dry-goods store. The tapestries, draped figures, figured dress goods, cloths for upholstery, etc., produced by this process are endless, involving all the colors of the rainbow; in fact the perfection attained in the art is truly amazing. Consult Rothwell, 'Printing of the Textile Fabrics' (Philadelphia 1882); United States Bureau of Manufactures, 'Statistics of Cotton Goods' (1912); Knecht and Fothergill, 'Principles and Practice of the Textile Printing' (London 1912); Beaumont, 'Color in Woven Designs' (1912). See TEXTILES; WEAVING.

TEXTILES, or TEXTILE FABRICS. Stuffs made by the weaving together of threads of any sort, so as to produce a material with a nearly solid surface. A fishing-net or the like is not a textile fabric because the cords which compose it are not woven together, but cross one another at equally distant intervals and are strongly knotted at those points. But practically any cord, although very open, because the threads are merely held by their own friction. On the other hand, if a basket is made by weaving together strips of wood or bamboo, such a material is hardly called a textile, but this merely because of its totally different nature, although much of the primitive domestic work is based upon such very simple portions of the loom; for it seems that man is never tired of producing, by up and down, in and out,
TEXTILES

In the most complicated patterns, such as the Japanese send us daily, in which a row of dragons will be with a row of representations of the pearl with its flames, and those again row of kylins or other fabulous monsters being interspersed. First the delicate leaves of the camellia and bursting flowers of the pomegranate, the same being red in many colors—even in such a concern it is readily seen that these figures, though in regular sequence, are not introduced in a definite and unaltered sequence. Thus a blue thread of the not appear more than once in each or a certain row across a piece of stuff; appearance of the blue thread may be void of a quarter of an inch long only, if the rest of that blue thread is found anging loose behind the finished fabric. His blue thread may not appear at all in seven inches of the length of the stuff, a very different method from the pattern. Still that blue loop in the design from the front or "right side" is in each one of the flowers or animals form the cross row of the pattern; and very few of the flowers or animals may be two feet away in the length of e) this blue thread may be replaced by on one, which will also appear at ex- se same intervals and at exactly the site in each one of the flowers or of design. It is interesting to take a very rich fabric with an elaborate pat- ed to examine it with a view to just cularities of weave. Anyone who has a simple loom at work and has mas- e process may then understand in great the workings of the far more elaborate the silk weaver, who is producing pat- fabrics.

Such weaving of patterns it is here as- that the threads are dyed before the is begun. The matter of printing upon calico, thin silk or the like is en- part from the consideration of textile

Printing is done from blocks with most often one pattern; receiving paper instead of a woven stuff, simplest weave made in this way with threads is gingham, the name of which from the East, probably from India, invention of the weave itself. Checks, nd stripes are the natural patterns of 1, but it is also practicable to produce zig-zag and frets, and the stripes them- ay be variegated by patterns on their

Weaves of Persian and Chinese origin "read and softer and more woolly than twisted cotton threads are sometimes active in color effect, woven exactly am is woven.

Ask linen, such as is used for table- is peculiar in that the pat- in elaborate twilled fabric in which the arranged to make a pattern—often even rs and leaves. These patterns are seen by the difference of reflection of light : threads of the linen; for those threads parallel to the direction of the widest band on a given point of view, while those in the other direction look dusky. A of the position of the beholder reverses this effect of light and dark. Moreover it is common that the same pattern is seen in reverse on the other side of the fabric. There is nothing to prevent damask linen being woven with dyed threads in parts of the composition, and occasionally tablecloths of such material come into fashion.

Brocade, a term generally used for very splendid material, means primarily a stuff—composed in part of threads which lie on the surface of the finished stuff (French brocêhes), appearing where the particular color is not far and disappearing again, as explained in the paragraph above. A brocade may be composed of threads all of one color. Thus the silks called damasê (French Damasêes, or Damasêes) have perhaps a pattern of dark green leaves relieved in shining threads upon a background of exactly the same dye, but looking different because of the different and less glis- tening character of the threads; this being caused not by the silk being differently spun, but because of the different way of treatment of the thread in the loom, the long loops lying flat and loosely, and reflecting the light in a different way from the hard pulled threads of the background.

Satin is a material with a silken surface of unusual and uniform glossiness, which is pro- duced by alternately raising and depressing four yarns of the warp across the whole of which the weft is thrown by the shuttle. It will be noted that this is a modification of twilling, and the threads of satin are seen to lie in the same way as those of a twilled cotton. It is evident that such a surface is capable of many modifications. Thus there are some fabrics of silk and wool, or silk and cotton, in which the silk threads are thrown to the surface, lying in very narrow stripes or bands, which show glossy on the background, which also show only in very narrow stripes between the others. These fabrics take different names from year to year.

Again, there are Eastern brocades in which the background is composed entirely of the warp threads in a satin weave of one color; while the flowers of the pattern are made up entirely of the woof threads and these in many colors with gold.

There remains to be mentioned those weaves in which the warp threads only are seen in the finished stuff. The most common form of this is ordinary ribbed silk, in which the warp threads form loops (silks called gros-grain and by other special names), giving a rib running across the stuff. Thus a silk in longitudinal stripes of darker and lighter green, buff and brown, has all its wool threads of a dull brown; while the warp threads of the four colors named form visible ribs in which the colors are alternated in a very elaborate fashion, so that one stripe is made up of a small check in two colors, another is plain and solid, of one color; and in all this the effect of the dark wool is to modify slightly the hues of the stripes by showing between the warp threads.

Velvet is made by carrying the threads of the warp over a rod called a needle, so as to produce a series of ridges or "ribs," as is explained in the last paragraph; and then cutting all these ridges by a sharp instrument passed in as the "needle" is withdrawn. This cutting leaves the
TEXTILES

threads standing up to form the nap or pile, but they are left of different lengths or heights, and, therefore, the whole surface is most carefully sheared and sometimes this shearing is helped by singeing. Fustian, velveteen and corduroy are made by the same process. Plush is a material of the same character and produced in nearly the same way. When the ribbed surface is left without being cut, the term "uncut velvet" is used. This may be used for a part of the surface, while other parts are fully cut and brought to the smooth surface common to velvet. In this way most elaborate patterns are produced—figures being in the velvet pile upon the ground of uncut velvet. Again this may be carried further in producing what is called "pile upon pile" velvet, in which the pile of one part of the pattern is relieved upon the shorter pile of another part of the pattern and this again upon the uncut background. It is evident that such stuffs are of great cost. The beauty of the pattern may also be enhanced by the use of different colors. The Venetian tapestry of the 17th century and modern copies of the same may have a general surface or background of a satin-like texture, upon which the flowers and leaves of the pattern are raised in various shades of gold, silver, green, crimson, buff and the like. The resulting pattern will be of extraordinary richness, effective at a distance and also near at hand. Such pieces made in Venice at the close of the 19th century would cost about 6 francs a yard when woven 20 inches wide.

The further elaboration of decorative weaving by the introduction of other materials than those of twisted threads, is also of importance. Thus "gold thread," as it is called, is commonly made of silver with gilded and then pulled out or "drawn," the silver and gold together, until it is very fine. This is apt to tarnish, the extremely thin gold disappearing with wear, and the silver not having the power of resisting impurities in the air. To avoid this permanently mutilating effect, gold paper is used by the Orientals, the paper being sometimes brown, as it shows on the reverse side of the stuff, and the gilded surface showing on the right side. The less expensive Japanese brocaded silks are often woven in this way. On the other hand, the tarnishing of the metallic gold thread often adds a special charm to the effect of ancient stuffs.

As textile fabrics have been used by all men more advanced than the most degraded savages, the history of textiles is of infinite extent. Even textiles of decorative purpose, those woven in a somewhat complicated way, are of unknown antiquity. Decorative stuffs have been found in Egyptian tombs of very early epochs. The tombs of the Incas and those of South America have been found to contain beautiful weaves. The earliest painted vases found in Egypt show boats with sails, and although some of these sails were perhaps of skin, there are others to which the evident purpose has been to show a woven Western Asia has always been the home of most beautiful designs in weaving, for very early time the people of the great thorough which the Tigris and the Euphrates run were producing fabrics with varied and splendid patterns. This taste the Asiatic feeling for color decor work with the loom took two different in later times. The carpets and rugs with pile were brought from Syria by at least as early as the 8th century A.D. at a later time they were somewhat in Europe, as is clear from the earlier paintings, in which rugs of un Eastern design are seen to cover the or the throne of a sacred person. heavy stuffs used in the West for warm and also for door and window curtains the general name of kelim are woven out pile, the patterns being, therefore, simpler, akin to those described above in connection with gingham and especially twilled material. Venice, the home and also solidly woven, very durable silk made with threads dyed of different colors in such minute patterns that the nowhere shows as broché on the surface been made for so many hundred years; at time of their introduction is hardly asc Cotton stuffs woven in a similar fast very pretty effects of simple patterns, little imported to Europe, but their East adds a great charm to the pop costume. Finally the printing of cottons wood blocks has been practised for tories, the pattern being admirably drawn composed and the colors always interest except where the effect of European does not last as long as the wood blocks are used for the more pre and more beautiful dyes of the East; secondly, to debase the color design orders given by the agents of Western ing houses. The growth of a beautiful industry in Italy, and the extent S made difficult by the rapid changes of which themselves are brought about great desire of large manufacturers in the material and the effect which will buyers. This where a greater willingness of the great dealers to keep fabrics which are out of fashion, be very numerous, because a Canvas stock of any one would be a trouble to house and to show on occasion, and it costs too much to sell goods that in constant demand. Everyone often the material which at a certain found to be exactly what he needed, possibly be obtained a few years later weaving.

Bibliography.—The greater number book devoted to this subject are collecti plates, often in color and beautifully These, however, give merely the the nature of the stuff can only be is rare that a book discussing the manufacture accompanies the best of these books is Fischbach's Der Gewebe. The works on Costi often contain much of the same ma Eastern carpets, Lessing's 'Alt Or.
muster' (Berlin 1877) gives a number of designs collected from paintings of the anc. Vincent Robinson's 'Eastern' (London 1882), and the second series same (London 1883), present a number of results belonging to the author, as a dealer on a large scale and also ar on his own account. The colored are from excellent original drawings. Books on Eastern rugs have been ed during the last few yeras, of which ae Mumford's 'Oriental Rugs' (New 900). The beautiful stuffs known to been used during the Middle Ages are by Franciscus-Michel in 'Recherches commerce,' etc., 'Des etoiles de sole,' vol., Paris 1852, and by Dr. Daniel in 'Textile Fabrics,' the South Ken- illustrated catalogue (London 1870). The author has supplied the 'South Ken- Handbook' (London 1876). Fr. Bock's 'chite der liturgischen Gewänder des liters' (Bonn 1859-71) is the standard n the subject of church ceremonial gar- constantly cited by all writers. One most valuable works for the student of mical side of textiles is 'The Draper's art' by William S. Beck (London and the modern fabrics in common use elligently treated by Caulfield and Sa , the 'Dictionary of Needlework' (London 1885); Mat- J. M., 'Textile Fabrics: Their Physi- rosophical and Chemical Properties' (2d new York 1907); Kinne and Cooley ag and Textiles (ib. 1913); Woolman Gowen, 'Textiles: A Handbook for the and Consumer' (ib. 1913).

TEXTURE, as a term applied to rocks, signifies the size and mode of aggregation of the mineral particles that make up the rock, in contrast to structure, which applies to larger features, such as bedding, joints, etc. A brief description of those textures which are particularly useful in classifying rocks will be found in the article on Rocks, in the section on 'Innumerable Rocks.'

TEZCUCO, täs-kō'kō', or TECOCO, Mexico, a town in the state of Mexico, situated on the northeast shore of Tezcuco Lake, 16 miles northeast of the national capital. The modern town has many handsome buildings, a number of manufacturing establishments and railroad repair shops. Cortes stopped here for a period in 1521 when he besieged Mexico. Tezcuco was one of the three confederated Aztec pueblos of the valley of Mexico, and for a time was the chief among them, yielding later the first place to Tenochtitlan. In its neighborhood are several ancient ruins, including terrains of teocallis. Pop. about 6,000; (2) commune surrounding the town; pop. 16,000.

(3) District in the state of Mexico, separated from the capital by a large lagoon; pop. about 60,000. (4) Lake or lagoon about four miles east of Mexico City, 13 by 9 miles, very shallow and surrounded by swamps.

TEZIUTLAN, täs-sé-oot-län', Mexico, the capital of a district of the same name in Puebla state, 50 miles from the Gulf and 12 miles east of Zacapoaxta. Pop. of town, 8,200; of dis- about 25,000.

THACH, Charles Coleman, American educator: b. Athens, Ala., 15 March 1860. He was educated in the schools of North Alabama and at the Alabama Polytechnic Institute from which he was graduated in 1877. He also pursued graduate work at Johns Hopkins University 1880-81. In 1881-82 he was professor of modern languages in Austin College, Texas, and from 1885 librarian and professor of English in the Alabama Polytechnic Institute. In 1902 he was chosen president of this institution which has long been the foremost scientific in- the Southern States. President Thach has greatly expanded the institution since he became president. He was a member of the Alabama History Commission 1898-1900, whose report resulted in the establishment of a Department of Archives and History for Ala- bama. He is also a member of the State textbook commission and the Rhodes scholarship commission.

THACHER, James, American physician and surgeon: b. Barnstable, Mass., 14 Feb. 1754; d. Plymouth, Mass., 26 May 1844. He studied with Dr. Ahner Hersey in Barnstable and in 1775 was appointed surgeon's mate in the Cambridge Hospital under Dr. John Warren. The following year he was made sur- geon's mate in a regiment stationed on Prospect Hill and marched with it to Ticonderoga where he was attached to the general hospital while the place was held by the Continental army, retiring with it in charge of the sick and wounded to Fort Edward and to Albany. He was transferred to the field service at his own request, was made chief surgeon to the
First Virginia regiment in 1778 and the following year was transferred to a New England regiment. He was with the Continental army until the surrender of Cornwallis and was noted for his skill as a surgeon and for his lofty patriotism. On retiring from the army after the war he practised in Plymouth and became well known by his scientific and literary pursuits. He was the author of much professional and literary work. His ‘Military Journal during the American Revolutionary War’ (1823) is an authority on that turbulent time and is notable for the vindication of Washington for his conduct toward André. Other noteworthy publications are ‘Observations on Hydrophobia’ (Plymouth 1812); ‘American Modern Practice’ (Boston 1817); ‘Practical Treatise on the Management of Pox’ (1820); ‘American Medical Biography’ (2 vols. 1828); ‘Essay on Demonology, Ghosts, Apparitions and Popular Superstitions’ (1831); ‘History of the Town of Plymouth’ (1832); ‘Observations Relative to the Execution of Major John André as a Spy’ (1834).

THACHER, John Boyd, American writer: b. Ballston, Saratoga County, N. Y., 11 Sept. 1847; d. 1909. He was graduated from Williams College in 1869, and was a New York State senator 1884–85, and mayor of Albany, N. Y., 1886, 1897. He was an officer of the World’s Columbian Exposition and became chief of its bureau of awards. His publications include ‘The Continent of America, Its Discovery and Its Baptism’ (1846); ‘Charlecote—Or the Trial of William Shakespeare’ (1860); ‘Little Speeches: Awards’; ‘Christopher Columbus, His Life, His Work, His Remains’ (3 vols., 1903–04); ‘Outlines of the French Revolution Told in Autographs’ (1905), etc.

THACHER, Thomas Anthony, American educator: b. Hartford, Conn., 11 Jan. 1815; d. New Haven, Conn., 11 April 1886. He was graduated from Yale College in 1835 and for three years taught in Connecticut and Georgia schools. In 1838 he became a tutor in Yale where he was chosen as professor of Latin in 1842 which position he retained until his death. During a sojourn in Germany he taught English to the Crown Prince of Prussia and to his cousin Prince Frederick Charles. Returning to Yale in 1845 he became active in college work and an important member of the faculty. He was famed as a classical scholar and wrote frequently on his specialty for various periodicals. He assisted in the compilation of Webster’s dictionary and edited many Latin classics, notably Cicero’s ‘De officiis’ which he annotated (New York 1850). He also translated Medicus’ ‘Latin Grammar’ and wrote a ‘Sketch of the Life of Edward T. Herrick’ (New Haven 1882).

THACKERAY, William Makepeace, English novelist: b. Calcutta, 18 July 1811; d. London 24 Dec. 1863. His father, Richmond Thackeray, N. Y., 1807–1846, was a financier and brother of Matthew Arnold. He was the author of ‘Dawn in India’, a book of a good Yorkshire poetic. His mother was Anne Becher, a Calcutta lady whose family was a family well known in the ecclesiastical scene. Richmond Thackeray died in 1836, and his widow continued with his mother for a year and was then sent to England to be educated. Five years after his mother, who had married Mr. Carmichael Smyth, came to England with second husband. Thackeray’s relations both were in later years exceedingly charmed. The little boy, who during his voyage was at sea, was brought up by his mother’s stepfather, who was a sergeant in the Royal Artillery. He was put to school under a Dr. Cunnington where he is said to have got hints for the writing of ‘Vanity Fair,’ and in 1822 he entered at the famous Charterhouse. He remained six years, imbuing loyalty of memory of such former scholars as A. and Steele, watching and engaging in such as he described later—in one of his old friends, George Stow Venables, who was growing his great height of six feet, three in reading and writing poetry, devouring and making sketches—in short, doing things but grounding himself in the classics. His schoolmaster wanted him to do. As he was a good Horatian, he remained a strictly modern spirit.

After studying at a little under his s and perhaps, having some of the c described in the early pages of ‘Pendennis’ went up to Cambridge and studied in Trinity College. Here he sat widely, particularly in the literature favorite 18th century; but he entered the regular academic routine parties in the society of such fellows as the Tennysons, Arthur Hallam, Str and R. C. Trench (q.v.). He also in hand at college journalism, writing p and other skits in the weekly Sab short, he went his own gilt, which was, but not injuriously, unsteady. He left bridge after two years of residence taking a degree.

He had already before his vacation been one to the charms of Paris, and a natural turn for art he had little inclina follow his relatives’ advice that he should law. His income from a fortune left father, perhaps £500 a year, was ample means, and he resolved to travel and st Continent. In 1830 he spent a summer in Weimar, where he saw Goethe and enough of the ways of natives and travel describe ‘Pumpernick’ in after in studies, whether of literature or o law, do not seem to have been exhaustive haunter.

By the close of 1831 he had returned land and began the study of law in the Temple. Trips to Cambridge, visits theatre, pipes with Alfred Tennyson and Edward Fitzgerald (q.v.) in February 1832 to have distracted his attention from stone, but the Temple itself impressed every reader of ‘Pendennis’ knows. I did some electioneering for his friend, Buller, and formed an acquaintance with interesting writer, William Maginn, which probably led later to his introduce the group of men who were making ‘Magazine’ popular. When he came of end his law books and spent so much of Paris he did, remained with his mother for a year and was then sent
ndard. He soon bought it and tried to act as its correspondent in Paris. His stories and reviews, which in review were unnecessarily exhumed, proved unsuccessful, and Thackeray lost money by it as well as by and by gambling (he had met some success). He seems to have felt seriously to make his living. He had a turn for drawing, inherited from his father, and he detested life of an artist in Paris would ruin him. Accordingly in 1834 he settled in that city, and although of great skill in his new profession, he went to an establishment with a view to good use in his book and in ‘Philip.’ He had begun his contributions to *Azine* by 1835, if indeed he did so in August and September, as Bulwer’s ‘Eugene Aram’(which has been so much admired by Catherine) and ‘Barry Lyndon,’ he was working on a Paris newspaper in conjunction with his task as a correspondent, a task which did not always go well. The first separate publication, the eight pages entitled ‘Flore et Zéphyre’ as Paris correspondent once more, have been published in *The Constitutional*, which did not last. Thackeray, who had previously attempted to start a newspaper of his own to have begun his contributions to *Azine *by 1835, if indeed he did so in August and September, as *Bulwer’s* ‘Eugene Aram’ was a great success. He had the task of being a correspondent in Paris, where he had been stationed before. *The Constitutional* had its misprints in the first issue, but here his rashes and his enough ever after in support of children to be absorbed from all thence to have gone to London, first daughter (afterward Mrs. ) was born. He reviewed books and contributed articles and stories, and other magazines, without much success. His name was not much known, though he was a regularer in the latter year was America, a country which appreciated his work. There was humor and satiric power in his stories, and a certain amount of literary respectability, though there were some authors like Bulwer that were less known than his. *Catherine,* which finished its *Azine,* in February 1840, and ought to have shown contemporary how well his author knew the 19th century and could follow the lead of Fielding, the two volumes of the *Paris Sketch Book* (1840), and the abruptly ended *Shabby Genteel Story,* the germ of *Philip,* were all creditable to *Mr. Michael Angelo Titmarsh,* as Thackeray had begun to sign himself, but were not yet unmistakable products of a mature genius.

*A Shabby Genteel Story* was cut short by the severe illness of Mrs. Thackeray, which followed the birth of her third daughter, later Mrs. Leslie Stephen. On returning from a trip to Belgium her husband found her strangely changed in mind. There were hopes that she might recover, and Thackeray gave her very constant attention, at home, in Ireland and on the Continent; but it was of no avail. She was finally placed with a kind family and survived her husband about 30 years. The two little girls, for one daughter had died in infancy (cf. *The Great Hoggarty Diamond,* 1841) were sent to his mother in Paris, and Thackeray set about making himself to work all the harder for the sake of his wife. He might ensure their support and that of his wife, should his own life be cut short. He had no thought of freeing himself by law, and, although suffering deeply as such a tender-hearted man was bound to do, he went about his work cheerfully, solacing himself as well as he could with club life and enjoying Bohemian haunts such as the *Cave of Harmony,* described in *The Newcomes.*

In 1841 he published his interesting small volume *The Second Funeral of Napoleon* and collected his *Comic Tales and Sketches,* unsuccessfully in both cases. In 1842 he made a tour of Ireland, which yielded materials for his *Irish Sketch Book* of 1843, and also for a much better book finished at Malta in 1844 at the end of the voyage to the East described in *Notes of a Journey from Cornhill to Grand Cairo* (1846). This better book was a story which has never been widely popular, but which competent judges have pronounced to be the best of Thackeray’s works. *TheLuck of Barry Lyndon.* It was published in *fraser’s* in 1844 and did not meet with enough favor to warrant its being put between covers until 1856, long after its author had become famous, when it appeared in the third volume of *Miscellaneous* in Prose and Verse. The public has never liked a villain for a hero and is uncomfortable in the presence of a writer with a genius for irony, hence Thackeray’s masterly memoir of an irrepressible Irish rascal, although it gives a brilliant picture of European life, even in the 18th century and is perhaps inferior only to *Jonathan Wild,* a piece of sustained irony, will probably continue to be praised by the critics and eschewed by the general reader.

Meanwhile Thackeray had formed a connection that gave him not only a reliable source of income, but also an organ in which he could publish anything he cared to draw or write, with the result that his creative faculty was stimulated and made copious. From June 1842 until 1851 he was one of the most important members of the staff of *Punch,* which had begun its career in July 1841. *Miss Tickleton’s Lectures on English History,* with which his contributions practically began, naturally fell rather
THACKERAY

that, but his copy improved, his sketches were generally appreciated and no one was more at home in the famous 'Punch' dinners, where the policy of the journal was shaped. His first great success was made with 'Jeames's Diary,' November 1845. This satire on railway-stock gambling was followed by the famous 'Snobs of England, by One of Themselves,' which began on 28 Feb. 1846 and ran for a year. Thackeray discovered snobs in altogether too many quarters, perhaps, and he has been accused of overlooking one at home; but it was only natural that he should wish to make good to the point of exhaustion and some of his papers were very clever. Most of them were reprinted as 'The Book of Snobs' in 1848. His next series, to-day more attractive to some readers, was his 'Prize Novelist,' excellent burlesques, which ran from April to October 1847, and took off, without malice and with very great cleverness, such popular writers as Bulwer, Disraeli, G. P. R. James, Lever and Cooper. One, 'Crimoline, by Jeames's II—sh, Esq.' was a target of Dickens and Lever. These were only the leading things he contributed to 'Punch.' Probably they are not so attractive to many readers to-day as some of his ballads and songs — particularly such a perfect piece of occasional poetry as 'The Cane-Bottomed Chair.'

His increasing success enabled him in 1846 to take a house and bring his daughters back from Paris to a home of their own. In this house, 13 Young street, he wrote 'Vanity Fair,' which was published, as the fashion then was, in monthly parts. In January 1847, it began to appear in illustrated pamphlets issued by the publishers of 'Punch,' and it ran till July 1848, when a double number was given. This method of publication was bad, because it did not force the author to complete his work and thus get the opportunity to see and criticize it as a whole before committing himself to type. It conducd also to spasmatic writing and to padding. Most of Thackeray's longer stories show the evil effects of the part-system, and so do the novels of Dickens and Lytton.

At first 'Vanity Fair' did not greatly attract the public, although now the opening chapters that introduce Becky Sharp are usually found very interesting. Contemporaries, of course, could have no idea that she was destined to become one of the great heroines of fiction, and they knew Thackeray, not as a distinguished novelist, but as a clever satirist and burlesquer and draftsman. Before 1848, however, readers were awake to the fact that they had another great novelist in their midst. Charlotte Bronte and the Edinburgh Review acclaimed him, and he became something of a literary lion. To this day 'Vanity Fair' is regarded by many people as his most important work, and his most artistic work, and readers still divide into partisans of Dickens and of Thackeray, the latter usually winning the suffrages of the more critical.

Meanwhile Thackeray, again rivalry of Dickens, his rivalry was of the freindliest kind since he had published several Christmas books: 'Mrs. Emm's Ball' (December 1846) the success of which he said to have helped 'Vanity Fair,' 'Our Street' (1847), 'Our Birch and His Young Friends' (1848), 'Rebecca and Rowena' (1849), the clever but perhaps superfluous upon 'Ivanhoe,' and 'The Trickle-bug's Rhine' (1850), which was attacked by 'The Times' and effectively defended in a pret to the second edition.

In November 1848 the first part of 'Pendennis' appeared. It was not concluded till December 1850, owing to a severe illness. Thackeray had in the autumn of 1849, in most autobiographical of his novels, and ingenuity has been displayed in discovering supposed originals of his characters for example, is thought to have been suggested in Captain Shandon. It is more as that 'Pendennis' is an effective copy of a literary life in London in Thackeray's way, that he had no intention of running down brother authors, as some critics accused of doing. With all its merits, 'Pendennis' suffers, as do 'Vanity Fair,' 'The Virginians,' from its long length.

Efforts had been made to supply 'Punch' with a permanent, definite income by him an appointment as a director of the postal service; but his well-meaning friends failed. In 1851, disliking the stand taken by 'Punch' against Napoleon III, he resigned the staff. Although he still continued to contribute, it seemed advisable to secure another source of income. This he found in lecturing. In May and June 1851 he delivered six lectures before distinguished audiences in London, on his favorite humorists of the century. They were successful when delivered, and, in their collected form, rank high among his works, for their clarity and their rare sympathy. They were sequently delivered in other places in Britain, and then, on 30 Oct. 1852, the sailed (in company with A. H. Clough and James Russell Lowell) to deliver America. Just as he was starting he received a copy of the novel he had been working months, reading in the British Museum, materials and laboring carefully upon his 'The History of Henry Esmond, Esq,' published in parts, and hence is the most of Thackeray's novels, with the exception of 'Barry Lyndon.' Its salutary study of character, its nice balancing of romantic realism that accompanies a minute of a period such as Thackeray possessess 18th century and particularly of the Queen Anne, its attractive though per what over-laborious style, and above all the pervading atmosphere of tender sentiment, made it not only a classic historical but the favorite book of many Thackeray, whom it is idle to point out that perhaps novel is after all masterly tour-de-force the essential vigor of Thackeray's get better displayed in the superb irony of 'Lyndon' and in the unfinching port human vices and follies that makes Fair memorable.

In America Thackeray was most received, and by his genial manners by many friends. He lectured in the cities of North and South and sailed for 1853, much richer in purse ($20,000) nately he did not attempt to travel to
account by writing a book upon it, as had done years before.

Next two years were spent in good part came to him in Switzerland, and during stayed in Rome, where he had a bad of fever, he wrote that charming bur- for children. 'The Rose and the Ring', for which he was made a fellow of his ful old child-fig-ure, Colonel Newcome, ublished in monthly parts from October 1855 inclusive; and is said to etted Thackeray £4,000. The spasmodic influence of polished style, but Thackeray's satiric power and his ing mellowness of sentiment were ex- y blended, and the book may fairly be a masterly presentation of domestic life. a character of Colonel Newcome, who has the traits of Thackeray's stepfather, is late critics to be grossly exaggerated. ngrily idealized, would seem a better in view of the appeal the old man has made still makes to thousands of hearts. October 1855 Thackeray again sailed to ted States, where he again remained he following April, lecturing on 'The forges' with great success and repeated ess, The English Humorists.' In he delivered the 'Georges' throughout d and Scotland, and enjoyed the society children and his numerous friends, mak- er lives bright, although his own was rotclouded by the precarious state of his. In July 1857 he stood as the Liberal for Parliament from Oxford and was d by a small majority, accepting his dis- ment gracefully. In November 1857 he quel to 'Esmond,' for which he had d material in America, the only partially ful Virginians,' began to appear and course in monthly numbers until Octo- . It was at least a notable link between ther and the daughter country and, al- it shows plainly the effects of Thack- ing; especially still for it, it probably s more praise than it usually receives, his time one of the most unpleasant in- in Thackeray's life occurred. Edmund (q.v.), a rising journalist, published in 1838 a sketch of Thackeray that was not per pleasing to the latter. Thackeray re- a stinging letter; Dickens was unfor- drawn into the affair on Yates' side; ray laid the correspondence before the te of the Garrick Club; the committee club took it too seriously; and Yates, g to apologize, was dropped from the Dickens seems to have been in the right, ray unintentionally in the wrong. ion between the two ensued; fortunately days before Thackeray's death, they met lent and shook hands spontaneously.

1860 a long-cherished desire of Thack- was fulfilled. His publishers, Smith and began to issue The Cornhill Magazine ary, and made him editor. The first had an enormous sale and he was as- as a boy. He secured Anthony Trol- other good contributors, but for his was forced to content himself with 'The Sketches by ' 'The Old Curiosity Shop, the work of a historical romance of the age of Henry ut which he had dreamed. Neither

'Philip' (1861, 1862) nor 'Lovel the Widow's (1860, 1861) was altogether worthy of his genius, but the delightful essays known as 'Roundabout Papers' (collected, 1863,) and to a less extent 'The Four Georges' (not reprinted until they appeared in the Collected Works, 1867-69) surely were. Thackeray soon found the cares of editorship — especially the duty of refusing contributions from eminent writer like Mrs. Browning, too onerous, and he was too old to become methodical; so he resigned in April 1862. His health steadily declined — though one finds little trace of the fact in the admirable chapters of 'Dennis Duval' (1867), which was running in The Cornhill at the time of his death. In November 1862 he was seriously ill. With his white hair he passed for an old man, although he was about 52½ years on that fatal night of 23 Dec. 1863, when he went early to bed without suspecting that death was so near. An effusion of blood took place in his brain, and he was found dead in the morning. On 30 Dec. 1863 he was buried simply at Kensal Green.

Thackeray, as has been said, was very tall — a colossal infant, Molley called him, with white, shiny, ringletty hair . . . a roundish face and a little dab of a nose upon which it is a perpetual wonder how he keeps his spec- tacles. He was as attractive to his friends as he still is to the admirers of his genius. Per- he was too much of a Bohemian in some respects, but as a father and a genial, kind- hearted man it would be hard to name any- erior. As a man of letters his rank is, of course, very high. Besides being one of the chief of English novelists, he was a draftsman of ability, though not of genius, an excellent writer of society and satiric verse, an eminent lecturer, a charming letter writer, one of the best of the English essayists, a born provider of burlesques and comic skits for the public of his day — in brief, he was an author of varied and copious genius, a master of humor, of satire, and of sentiment, and in addition he was es- tuted though by no means small intellectual powers and an admirable stylist. Unfortunately the task of appraising the value of his work has been rendered difficult by the extravagant wor- ship of his partisans. Many of the volumes that have been added to his works since his death represent merely his talents as a journal- ist, not his genius as a writer, and even his best books are often defective in structure or in strength. We are still too near him to be able to tell whether he will finally outrank Dickens as a creative force in literature or whether he will rank with Fielding as a portrayer of char- acters and manners. We are not too near to perceive that he is not so important in the evolution of fiction or so cosmopolitan and heroic a figure as Sir Walter Scott. But his place is certainly with this small group of illustrious novelists. See BARRY LYNDON; HENRY ESMOND; NEWCOMES, THE; PENDENNIS; VANITY FAIR.

Bibliography.—Thackeray's works have appeared in many editions — notably that of 1883-84 in 26 volumes, and the 'Biographical Edition,' with valuable introductions of Mrs. Ritchie. The Thackeray revival occurred after the publication of Mrs. Ritchie's edition — editions being
THAI—THALLIUM

superintended by Mr. Lewis Melville (important for completeness, faithfulness to the original, bibliographical and historical information), by Mr. Walter Jerrold, and by W. P. Trent and J. B. Henneman (the Cornhill Edition, 1904, 30 vols., with introductions and bibliography). The chief lives of Thackeray are those by Anthony Trollope ('English Men of Letters,' 1879), by Henry Merivale and F. T. Marzials ('Great Writers,' 1891), by Lewis Melville (2 vols., 1899) and by Charles Whibley (1903). There are numerous volumes of Thackerayana and separate reprints of early works, as well as several special bibliographies, such as M. H. Spielmann's 'The Hitherto Unidentified Contributions of W. M. Thackeray to Punch' (1900). His correspondence with the Brookfields was collected in 1887. Consult also the article by Leslie Stephen in the Dictionary of National Biography, and for criticism, W. C. Brownell's essay in 'Victorian Prosse Masters' (New York 1901); Benjamin, L. S., Some Aspects of Thackeray' (Boston 1911). William P. Trent, Professor of English Literature, Columbia University.

THAI, an East Indian word meaning "free," and the general designation of certain peoples of Farther India, including the Thos, Muonges, Shan, Laotians and Siamese. Although widely diverging in certain characteristics, they speak languages derived from the same stock, and are evidently of common descent. The Siamese, the best known and most civilized of the Thai group, are considerably mixed with Malays, Hindus and other races, and are of medium stature and broad-headed. The Laotians are shorter in stature than the Siamese, and their skulls are less distinctly of the broad-headed type. Consult Dignon, 'Etude de la Langue Tai' (Paris 1886). See Laos; Shan States; Siam.

THAIS, thā'īs, a Greek hetaera; b. at Athens, who accompanied Alexander the Great on his expedition to Asia. She is said to have instigated Alexander to set fire to the citadel of Persepolis, the residence of the Persian kings, in punishment for the injuries done to her native city by Xerxes; but this anecdote, though immortalized by Dryden, is probably untrue, as we know on the authority of Arrian that it was his intention to sack the place and burn the citadel on grounds of state policy. After the death of Alexander, Thais became the mistress of Proknei Lici, and, according to Athenaeus, was afterward married to him. She was celebrated for wit and repartee, and many anecdotes are recorded of her talent.

THALBERG, tālˈbərk, Sigismund, Swiss pianist; b. Geneva, 7 Jan 1812; d. Naples, 27 April 1871. He was the natural son of Prince Moritz Dietrichstein and Baroness von Witzlar. He studied piano playing. At 14 he was an accomplished pianist. In 1830 he made his first concert tour, which included a visit to England, Holland, Scandinavia, and Spain, while in 1855-56 he visited South America and the United States. His playing was notable for its beauty of tone and the charm of its bearing, rather than for brilliancy or fire. To himself belong certain innovations in playing, accepted as a mark of his prominence though not original with him; such for instance as that of playing the cantilena in staccato notes by the thumbs, while the rapid hand plays arpeggios or octave above and below them.
THALLOPHYTA — THAMES

id chambers. To obtain metallic thallium this flue dust, it is dissolved in dilute ric acid, filtered, and hydrochloric acid h. The slightly soluble thallium chloride ies. This is changed to the sulphate, d at the various elements accompanying m and the thallium sulphate decomposed trolysis or by action of zinc. Thallium, 1 Tl, has an atomic weight of 204.18, spe-gravity 11.19 and fuses at 561° F. A cut surface has a brilliant silver white which is quickly lost by the oxidizing of the air. It is softer than lead and is ble. The metal dissolves readily in sul- or nitric acids, but only slightly in hloric acid. It forms two classes of unds: the thallous compounds derived he oxide TlO, and the thallic compounds TlOi. The salts of the first class re: the corresponding salts of potassium odium. The chloride, however, resem- rose of silver and lead in its insolubility ter. Thallium compounds are used in a:ferred to a non-luminous name. They are very ous, resembling lead in physiological ac Thallium and its compounds are used in nanure of thallium glass, the high fice power of which makes it valuable in the preparation of optical instruments and ficial gems.

[ALWEG, the lowest line of any val drainage course. In valleys with rivers, the natural ion course, in dry valleys it gully through which storm waters run off.

[AMES, têmz. Canada, a river in the eastern part of Ontario, rising in Perth and flowing southwest, 160 miles, into Saint Clair, about 30 miles east of De-Mich. It is navigable, 18 miles to Chat-ty boats of considerable size, but has a bar at the mouth. On the banks of river, about 30 miles above Chatham, a band was made by General Proctor and, when pursued by General Harrison in the pursuit of this band the position chosen was und very favorable to the American ad-

On 5 Oct. 1813 Harrison with 3,000 attacked and by a vigorous charge of cav-nder Colonel Johnson drove the British at confusion from the field. Tecumseh and General Proctor himself barely d capture. The Americans lost 47 and itish 48, besides 33 Indians; 477 prisoners aupted. The results of the battle were: dian Northwestern Confederacy was de-; the British power in Upper Canada roken and practically all that had been the Americans at Detroit was regained.

[AMES, thâmz, Conn., a river in the estern part of the State, formed by the m of the Quinehaug, Shetucket and Yan ers at Norwich, whence it flows south 15 miles to the Long Island Sound. ts mouth on the right bank lies the city w London. It is really a tidal estuary, and beautiful waterway navigable for vessels to its head, and an important ave local commerce.

[AMES, têmz. England, the most import- famous river in Great Britain, rising in Gloucestershire, and flowing in an irregular eastward course into the North Sea. It separ- rates the counties of Gloucester, Oxford, Buckingham, Middlesex and Essex on the north from Wilts, Berks, Surrey and Kent on the south. Its total length, measured from the Nore Light, is 217 miles, of which 180 miles are navigable. The upper waters around Oxf ord are known to the poets as Isis. The river passes the cities of Oxford, Reading, Maidenhead, Windsor, Chertsey, Kingston, and passes through the heart of London. Below London it widens gradually into an estuary, which, at the mouth, is 27 miles wide. The river is navi- gable for the largest vessels up to the east end of London, where the great Victoria, Albert and West India docks have been constructed. The upper course is connected by an extensive canal system with the Severn River and the middle counties. Pike, perch, roach, dace and other fish are caught in quantities. The surface of the Thames from Oxford is largely taken up by pleasure boats and regattas, the weather, and the regattas held then are world famous. The Medway is the largest tributary. The Cherwell flows in at historic Oxford 112 miles up stream; the Pang flows in at Pangbourne 51 miles from London. The Basset net at Reading, six miles farther down. The water supply of London is taken mainly from the Thames. The natural flow is about 350,000,000 gallons a day, and the water companies take about 130,000,000 of this. Naturally the utmost care is taken to preserve the water from pollution by sewage. In passing through Lon don the water front of the river is vastly increased by the method of constructing docks cut out in rectangles from the land. In no other way could the 40 miles of water front be made to serve the enormous business of London.

THAMES, Battle of, in the War of 1812. On 12 Sept. 1813 General Harrison, who was still at Seneca on the Sandusky River (see FRENCHTOWN, BATTLE OF), received word of Perry's victory on Lake Erie (see ERIE, LAKE, BATTLE OF; PERRY, O. H.) and began to prepare for his campaign against Detroit. By dint of hard work Harrison recruited his army to 6,500 troops, commanded by Brig.-Gen. Dun can McArthur and Lewis Cass. Lieut.-Col. James V. Ball, Gov. Isaac Shelby of Kentucky and Col. Richard M. Johnson (qq.v.). At Malden and Detroit Proctor had 983 British regulars and at Amherstburg were 2,500 In dians, but when Harrison landed at Middle Sister Island, Proctor burned the public property at Detroit, and on 24 September withdrew to Sandwich. Three days later Harrison occupied Malden, then entered Sandwich, Proctor having evacuated, and began to pursue the British, who, on 5 October made a stand on the Thames River, a mile from the Moravian town and about 30 miles above Chatham. The British formed with their left near the road to Detroit, and their reserve with a six pounder between the road and the river, while the Indians were on the right near a swamp. Harrison divided his troops as follows: Gen. George Trotter's brigade of 500 men in front, with right on the road and left on the swamp; Gen. John E. King's brigade 150 yards to the rear; and sup
thanatopsis—a view of death), the earliest American poem to present a thoroughly noble thought in a thoroughly noble form, was written by William Cullen Bryant—then about 16—in 1810, published, without the poet's knowledge, in the North American Review in 1817 and greatly revised for Bryant's Poems of 1821. From the first it was regarded as a masterpiece, and it speedily won a hold upon the popular mind which has hardly been surpassed by that of any other serious native poem. Without question, the large, simple idea of the piece has had much to do with its fame. There is consolation for most human beings in the reflection that death, though unavoidable, is also common to all, and that the whole of mankind—spiritual or sensual—eventually lies in the splendid earth. Perhaps Bryant's answer to the question which had been tormenting him—How can one be reconciled to death, more pithy, than many of his readers have suspected? he offers no promise of immortality and refers to no deity higher than nature. But the sincerity and eloquence of "a view of death" lift it above argument. Its largeness and harmonious, its fiction universal, its images—drawn from the American landscape—magnificently, on a blank verse stately, its rhythms in unison and with its swelling emotions is the distilled essence of late Puritan poetry, as the Puritans had been the thought of death, and yet so far from their particular doctrines and biases as to be able to utter a universal thought in universal terms.

THANE, the name of an ancient title among the English or Anglo-Saxons. A man not noble was raised to the rank of thane by acquiring a certain portion of five hides for a lesser thane), by a man at sea or by receiving a manor of land, whether connected with the personal service of the king or only on the condition of residence in the thane's district or administration of justice, were entered to the thane's land, where the landed property guaranteed for his conduct. The thanes were the predecessors of the barons.

THANKSGIVING DAY, an annual festival of thanksgiving for the mercies of the closing year, fixed by proclamation of the President of the United States. The President's proclamation makes the day a legal holiday in the United States, where it ranks as the most solemnly observed festival, taking the place which has been nearly universally observed—than that of Christmas. The annual celebration of Thanksgiving in America was kept by the Pilgrims at Plymouth in 1621 and repeated often during that and the following century. Congress recommended the observance annually, and the Presidents have always issued proclamations appointing the last Thursday in November as Thanksgiving Day.
of Maderia, with a thick umbrella, or palm-like, crown of finely-cut foliage three or four feet across.

THASO, tha’so̅, or THASOS, an island at the northern end of the Ægean Sea, off the coast of Macedonia. Its area is 167 square miles. It is nearly round and about 16 miles in diameter. Excepting some low strips along the shore adapted to agriculture, it is covered by thickly wooded mountains, which in ancient times yielded gold and marble. The forests contain wool valuable for shipbuilding. Corn, fruit, oil and wine are produced; wax, honey and a superior marble are exported. It was settled by the Greeks about 700 B.C. About 463 B.C. Athenians captured the city, razed the walls and took away the shipping. The Romans freed the territory after the battle of Cynoscephalae, 197 B.C. The Phoenicians were attracted to the island at an early epoch by the gold-mines; and an Ionic colony settled there in 8 A.D. The island since then has changed hands several times and now has an Egyptian ruler. The capital, ruins of which are still to be seen, was on the northern coast, on the site of the present landing-place of Limena. The products yielded gold and marble. The forests are divided through villages and totals about 12,000.

THATCHER, thäch’er, Henry Knox, American naval officer: b. Thomaston, Me., 26 May 1806; d. Boston, Mass., 5 April 1880. In 1823 he entered the navy as midshipman and became a lieutenant 1833. In both attacks on Peking he commanded the first division of Commodore Porter's fleet. After the Civil War he commanded the Gulf squadron until 1866 and the squadron of the Pacific from 1866-68. He was made rear-admiral in 1866 and in 1868.

THAUN, or THAON, Philippe de, early Anglo-Norman poet: b. probably near Caen, France, about 1100. He wrote a versified ecclesiastical calendar known as 'Li Cumpoz' and his is the earliest work of this period (about 1115) that is known. His most important work was written about 10 years later and is known as 'Li Bestiare' or 'Physiologus.' This also was in rhymed and but one copy is known. In it the creatures are grouped and treated symbolically. The manuscript was dedicated to Adelaide, queen of Henry I, and the work is valued chiefly as a linguistic relic. Consult Walberg's 'La Bestiare de Philippe de Thaun' (Paris 1900).

THAW CASE, a criminal trial noted in legal annals as 'the most notorious case in the recent history of American criminal law.' Harry Kendall Thaw, son of a distinguished and wealthy Pittsburgh, Pa., family, 25 June 1906, shot and killed Stanford White, a distinguished architect, in the roof garden of Madison Square Theatre, New York, of murder was in outcome of Thaw's marriage to Evelyn Nesbit, an artist's model and actress, who accused White of abusing her. A long-drawn-out trial resulted, notable for Thaw's plea of insanity, his escape from Matteawan State Hospital for the Insane, his flight into Canada, his ejection from the country and subsequent arrest in New Hampshire and repeated trials following. In the original trial Thaw was sent to Matteawan, 1 Feb. 1906, and was kept there until 17 Aug. 1913, when he escaped by alleged conspiracy with his keepers, an escape which lawyers were concerned. Thaw finally was brought back to New York State, indicted for conspiracy and acquitted. Later he was declared sane and taken to his Pennsylvania home where he remained because of the refusal of the local authorities to agree to his extradition.

THAXTER, thäch'ter, Celia Laitghon, American poet: b. Portsmouth, N. H., 29 June 1835; d. island of Applethorpe, Isles of Shoals, 26 Aug. 1894. She spent her childhood and much of her later life at the Isles of Shoals. In 1851 she was married to Levi Lincoln Thaxter, who was accustomed to visit the island long before they had become a popular summer resort. Her first published poem, 'Landlocked,' was printed by Lowell in the Atlantic. The motive of subsequent verse is also generally the sea and coast scenery, though the arts, particularly music, claimed some of her attention. Its note is one of much original power. Her works are 'Poems' (1872); 'Among the Isles of Shoals,' prose sketches (1873);' Poems' (1874); 'Drift Weeds' (1879); 'Poems for Children' (1884); 'The Cottage Mystery' (1886); 'Idyls and Pastorals' (1886); 'The Yule Log' (1889); 'An Island Garden,' a prose diary (1894); 'Letters' (1895); 'Stories and Poems for Children' (1895). A collected edition of the 'Poems' appeared in 1896. Consult the 'Letters'; also an article in the New England Magazine (Vol. 24, pp. 166-72).

THAXTER, Roland, American botanist: b. Newton, Mass., 28 Aug. 1858. After receiving a Harvard education and securing his Ph.D. there, in 1888 he became a professor of biology and botany in the university and a noted authority on the fungus diseases and on cryptogamic botany. From 1885 to 1891 he was expert mycologist of the Connecticut Agricultural Experiment Station. He was chosen American editor of the British 'Annals of Botany,' elected president of the American Botanical Society and in 1912 made a member of the National Academy of Science. He has contributed to many scientific publications dealing with his specialties.

THAYER, thär, Abbott Handerson, American figure painter, who also has painted animals and landscapes; b. Boston, 12 Aug. 1849. He was a student at the École des Beaux Arts under Lehman and Gérôme from 1875 to 1879. Upon his return to America he was made president of the Society of American Artists. He was the discoverer in 1894 of the Laws which underlie Concealing Coloration; and published in 1909 'Concealing Coloration in the Animal Kingdom' (written by his son, Gerald H. Thayer). He is a member of the National Academy of Design, of the American Academy of Arts and Letters and of the L'Insigne Reale Accademia Romana delle Belle Arti Denominata di San Luca. Among his popular works are 'A Young Woman' (in the Metropolitan Museum, New York); 'A Virgin' (National Gallery, Washington, D. C.); 'Woman in a Figure' (Albright Gallery, Buffalo); and 'Caritas' (in the Boston Museum).

1817; d. Trieste, Austria, 15 July 1897. He was graduated from Harvard in 1843 and from the Law School in 1848. For a time he was assistant in the Harvard Library, and while there determined to write a life of Beethoven. In 1849 he went to Europe to collect material for this work and lived abroad the greater part of his life. In 1859—62 he was United States consul at Trieste, Austria, and after that devoted himself entirely to his literary work. The first volume of his ‘Life of Beethoven’ appeared in 1860; the second in 1872; the third in 1879 and the fourth was nearly completed at the time of his death; it was published in German, although originally written in English. It deals with the life and character of the man Beethoven rather than with his musical work; and is very detailed, exact and impartial. Thayer also wrote ‘Signor Masoni’ (1862), and ‘The Hebrews and the Red Sea’ (1865).

THAYER, Benjamin Bowditch, American mining engineer; b. San Francisco, Cal., 20 Oct. 1852. He was educated in the Harvard Scientific School and on graduating in 1883 at once began active work in connection with the Anaconda Copper Company, of which he became president. He later was made vice-president of the Amalgamated Company which absorbed it. He was president of the American Institute of Mining Engineers in 1914 and the following year was named on the United States Naval Consulting Board, where he did much good work.

THAYER, Eli, American educator and inventor; b. Mendon, Mass., 11 June 1819; d. Worcester, Mass., 15 April 1899. He was graduated from Brown University in 1845; became principal of the Worcester Academy; and in 1848 founded The Oread, an institute for young ladies in Worcester. He was a member of the State legislature, 1853–54, and of Congress, 1855–61, and conducted an ‘Emigrant Aid Company’ which settled portions of Kansas on the anti-slavery basis. Subsequently he acquired manufacturing interests in Massachusetts and received patents for a section safety system, called a ‘jelly brake’, which was made into a hydraulic elevator. Besides his Congressional speeches (1860), he published a volume of ‘Lectures’ (1886), and ‘The History of the Kansas Crusade’ (1889).

THAYER, Ezra Ripley, American advocate and educator; b. Milton, Mass., 21 Feb. 1866; d. September 1915. He took his LL.B. degree at Harvard in 1891 and was admitted to the bar in Boston directly afterward. His progress was rapid and he became Dane professor of law at the university and dean of the Law School. He was a member of a noted firm of attorneys and was particularly interested in raising the standards of his profession.

THAYER, James Bradley, American author and lawyer; b. Haverhill, Mass., 15 Jan. 1831; d. Cambridge, Mass., 14 Feb. 1902. He was educated in local schools and graduated at Harvard in 1854. He began his prelegal life to teaching but after securing his LL.B. degree from the university in 1856 rose speedily in the law, to which he was admitted in that year. In 1873–75 he was Royal professor of law in Harvard and from 1881–92 held the chair of law professor. Iowa University gave him his LL.D. degree in 1891; Harvard in 1901. In 1861–65 he was secretary of the Loyal Publication Society, and was also fellow of the American Academy of Arts and Sciences and a member of the Massachusetts Historical Society. Besides many contributions to scientific publications he was author of ‘Letters of Chauncey Wright’ (1877); ‘A Western Journey with Emerson’ (1884); ‘Cases on Evidence’ (1892); ‘The Origin and Scope of the American Doctrine in Constitutional Law’ (1893); ‘The Teaching of English’ (2nd ed., 1893); ‘Inchindon’s Cases’ (1895); ‘Cases in Constitutional Law’ (2 vols., 1895); ‘The Development of Trial by Jury’ (1896); ‘Preliminary Treatise on Evidence at the Common Law’ (1898), etc.

THAYER, John Adams, American publisher; b. Boston, 20 Feb. 1861. He had a common school education in Cambridge and became a noted printer and typefounder. In various responsible capacities he was connected with such representative publications as the ‘Ladies’ Home Journal’, ‘Mansey’s Magazine’, the ‘Delineator’, etc. From the beginning in Paris from 1906 to 1911 he again became a publisher, notably to the ‘Smart Set Magazine’. His best known publication is ‘A Publisher’s Life Story’ (1910; rev. ed., 1912).

THAYER, John Milton, American soldier, lawyer and politician; b. Bellingham, Mass., 24 Jan. 1820; d. 1906. He graduated at Brown University in 1841 and became a member of the Massachusetts bar, removing in 1854 to Nebraska where he was made a member of the territorial legislature in 1860. Previous to entering on political life he was a territorial brigadier-general and fought successful Indian campaigns, placing the Pawnees on a reservation in 1859. In the Civil War he also was a brigadier-general and led a Nebraska regiment. For services at Vicksburg, he was brevetted major-general. Returning to Nebraska in 1865 he was elected to the United States Senate (1867) and afterward was appointed by Grant as governor of Wyoming Territory. In 1886 he was elected governor of Nebraska and also was made a member of the National Committee of the Grand Army of the Republic for the state. Brown University conferred on him the honorary A.M. degree in 1847 and the University of Nebraska gave him its LL.D. in 1902.

THAYER, Joseph Henry, American educator; b. Boston, Mass., 7 Nov. 1828; d. Cambridge, Mass., 26 Nov. 1901. He was graduated from Harvard in 1850, from Andover Theological Seminary in 1857, and was pastor of the Congregational Church at Salem, Mass., in 1859–64, being absent from his charge for nine months in 1862 when he served as a chaplain in the Union army. In 1864 he accepted the chair of sacred literature at Andover, which he resigned in 1882 to become professor of New Testament criticism at Harvard. He published ‘A Greek-English Lexicon of the New Testament’ (1885); ‘A Biography of John Cotton’ (1887); ‘A Biography of John Eliot’ (1894); ‘The Greek and English Bibles’ (1897); ‘The Change of Attitude Toward the Bible’ (1897); ‘Bibles and Their Use’ (1899); etc.

THAYER, Sylvanus, American soldier; b. Brantree, Mass., 9 June 1785; d. South Braintree, 7 Sept. 1852. He was graduated at Dartmouth in 1807, and at West Point in
For four years he was occupied, chiefly in Boston and New York, in the construction of coast-defenses. During the War of 1812 he served as chief engineer of the Northern Army on the Niagara frontier and at Lake Erie, as chief engineer and brigadier in the defense of Norfolk, Va. After a period of observation in Europe, where he visited the fortifications and military schools, he became superintendent at West Point, a position he held from 1819 to 1833. He was president of the board of engineers, and was in charge of the construction of roads and harbor improvements around Boston. In 1833 he was appointed arbitrator in a dispute between the city and the State of New Hampshire, and in 1833 he was appointed to the diplomatic service, first in Vienna, and then in St. Petersburg. In 1833 he was appointed to the diplomatic service, and in 1834 he was appointed to the Russian mission to St. Petersburg. He was the author of several medical and surgical works, notably "Lectures on Malarial Fever" (1897).

THAYER, William Sydney, American physician: b. Milton, Mass., 23 June 1864. He was graduated at Harvard in 1885 and took his degree as doctor of medicine there in 1889. He was for some time a member of the medical staff of the Johns Hopkins University and visiting physician at the hospital there. He is a member of several medical societies at home and abroad, and has made valuable researches in fever and was first to report the third heart sound at his clinics. In 1917 he was with the Russian mission to Petrograd. He is the author of several medical and surgical works, notably "Lectures on Malarial Fever" (1897).

THAYER SCHOOL OF CIVIL ENGINEERING, a department of Dartmouth College (q.v.).

THEAGENES (thē-gē'ē-nēz) AND CHARICLEA, καρίκλε'α, a Greek romance written by Heliodorus, bishop of Trikka, in the 4th century. The story recounts the love and adventures of Theagenes, a Thessalian and Chariclea, daughter of the queen of Ethiopia, and is the foundation of many later romances both by the early Greek fabulists and the later French novelists, including Achilles Tatius among the former, and Gombrerville, Scudéry and D'Urfé among the latter. It was translated into English by Thomas Underdown (1577), and into French by Jacques Amyot (1586).

THEATINES. See Orders, Religious.

THEATRE (Greek, a place for seeing, from θέα, to regard or look at), literally any building used for purposes of exhibition, but now generally applied to a place in which dramatic and musical performances are given. The theatre may be considered as a form of architecture which found its earliest expression in the classic ages of Greece and Rome, and after a long eclipse has again become important within the last 250 years. The term theatre also comprises the whole mass of dramatic literature and its theatrical representation. In this article it is proposed to deal (1) with the theatre as an architectural edifice from its earliest beginnings down to the present. For the treatment of the theatre as a form of artistic expression see Drama.

The Theatre in Architecture.—The theatre had its origin among the Greeks. Its germ was the ring in which dithyrambs and phallic songs were performed by choruses in honor of Dionysus. These were performed in an orchestra or circular dancing place, on all sides of which the spectators were ranged. Later a table was introduced, on which the leader of the chorus stood while he carried on a dialogue with the rest of the choristers. The use of the table was reserved for the choral odes. This table was the first and most rudimentary form of stage and the date of its introduction is about 500 B.C. Next an actor, a single actor, was introduced by Thespis and, as he played many different

(1917); 'Theodore Roosevelt' (1919). He is an overseer of Harvard College; vice-president American Historical Association; member National Institute of Arts and Letters; Fellow, American Academy of Arts and Letters; Fellow, American Academy of Arts and Sciences, and corresponding secretary, Massachusetts Historical Society.
parts, a tent had to be erected in which he should be able to change his mask and dress. Out of this tent arose ultimately the stage building on the Greeks, which even after they became elaborate structures of stone retained the name skênê, "tent or booth" (cf. English scene).

Greek Theatrical Architecture.—From the remains of various Greek theatres which have been excavated on the mainland and on Crete, at least in its main features, one of these edifices. In the centre the orchestra formed an exact circle in the middle of which stood the altar of Dionysus. Later the circle was cut on the side next the stage. Round the orchestra, in size rather more than a semi-circle, the seats for the audience rose tier upon tier like a modern baseball field stand. These seats were at first of wood, but owing to a collapse of the benches in 499 B.C., it was resolved at Athens to erect a permanent stone theatre. This was the theatre of Dionysus, which exists today, although it has been partly reconstructed. It consists of three parts—the orchestra, stage house and auditorium. The orchestra was occupied solely by the chorus. Behind it rose the stage buildings, usually a long, narrow rectangle, facing the audience; the most ancient one at Athens was 55 yards long and only 11 yards deep. But then little scenery was used. In front the buildings represented a palace or a temple. There were usually three doors opening on to the stage, which was a wooden platform, standing 8 or 10 feet above the orchestra. On it the actors appeared. The auditorium or building was intended to accommodate practically the whole population of the city in which it stood. The rows of seats in consequence were of enormous size, the theatre of Dionysus at Athens holding 27,500 persons, and that at Megalopolis being computed to seat 44,000. In order to obtain the necessary slope for the tiers of seats as well as a natural substructure for the same the Greeks always chose some natural hollow where the shape of the ground aided the design of the architect. Tiers of seats rose one above another, divided vertically by passages for access and in many cases horizontally also. The lowest or first row of seats at Athens is of marble, and was reserved for persons of distinction; the rest are of ordinary stone. Between the auditorium and the stage were the passages of entrance (parodoi) which in some instances were of great breadth. The back-wall was called the scena, the side-walls, or wings, in each of which was an entrance door being called paraskenia. The stage was called the proscenium. A flight of steps, later two, connected the stage with the orchestra and these steps, continued out of sight beneath the orchestra. The orchestra was covered by a curtain (aulistra) which was let down, not drawn up as is usual today. When the action of the play required a different scene, the back of the stage was covered with painted curtains or backdrops. At either end of the stage was a large rear stage, or acroterium, each side of which bore a different scene, thus providing three sets of wings. In dealing with the early Greek theatre it must always be remembered that the stage was only of secondary importance, the orchestra being the chief point of interest. There was a certain amount of machinery, of which the famous was a species of crane by which gods could be let down from on high or up again as occasion required. The Greek theatre was reconstructed at it was a species of religious other performances took place only on festival when the whole population turned out to witness them. The acoustic properties appear have received little attention. Actors used species of megaphone device, concealed in the masks, in order to make their voices carry a distance. Besides the theatre at Athens six theatres existed also at Epidaurus, Dyonysus and Megalopolis.

Roman Theatres.—The Roman theatre is largely founded on Greek models. It was before a permanent theatre was erected Rome because it was thought that such a display was not in harmony with the spirit of the republic. At an early period drama performances took place in temporary wo structures and amid such surroundings as comedies of Plautus and Terence were produced. Toward the close of the republic wooden theatres were erected in Rome. Pompey was the first to construct one. His theatre, which may be taken as the model, near the Campus Martius differs naturally from the Greek model. The stage was a semi-circle and there was no altar singing and dancing were transferred to the and the orchestra space was occupied by for prominent persons. The stage was large. The seats were built of masonry, not excavated out of a hill side or planted on a natural slope. The use of the arch and of concrete by Romans facilitated this mode of building under Roman hands the theatre first an architectural unit, with auditorium, stage and buildings all joined in a structure. There are extensive Roman theatres; among the most celebrated are those of Rome, Orange, France, Ephesus, Miletus, Cnidus, Taormina and Naxos. Roman theatres were frequently much larger than the Greek and there were frequent arrangements to protect the audience from the sun’s rays by an awning. The Roman theatre of the empire degenerated into sheer lasciviousness and the rise of Christianity brought a new and valuable foe to this kind of spectacle. The incensed against the public spectacles, clerics were forbidden to be present, gradually the new morality gained the theatre and the approach, which had been a feature of social life of the people.

Middle Ages.—During this period the market plays and was under the mantle of the Church theatre not. Plays were presented generally in c or monasteries, and the most elaborate used was a three-story scaffold representing heaven, earth and hell. Strolling players gave performances in temporary huts period in, therefore, entirely lost gards theatrical architecture.
Theatre to the Present.—With the Renaissance in the 16th century also a revival of the drama, and theatres to be built. The earliest was probably a house of some sort in the Hôtel de Cluny, Paris, which was built about 1548 as a Fraternity of that Passion. The earliest and perhaps the most celebrated was that which Bramante designed at Rome in the Grand Court of the Vatican about 1580. Then came the Teatro di San Carlo at Naples, designed by Palladio, and in 1584; while the earliest theatre built in England was constructed by Alcotti at Oxford in 1618. In all the early Continental theatres, the construction was founded on models, but in England a simpler idea prevailed: the stage was erected for theatricals. This was the Theatre, built by Inigo Jones for the Duke of Chesterfield and erected in London in 1613. The stage was in the open air, and the spectators stood or sat in the yard called the yard), while all round it ran galleries or boxes (then called rooms) like the galleries of an inn. There was provision for scenery. The door at the rear of the stage, which communicated with the dressing-rooms, etc., and was the general entrance for the actors, was hung with curtains, and some distance up the stage, which was drawn and undrawn to indicate an apartment, but the locality in which the actors were playing, was indicated by a placard hung on the wall. This was called a forest. Properties, furniture, were, however, largely used until the theatre was considered good enough. The stage was elevated, and the auditorium, which was the only part of the building that remained, was a large part. The interior arrangements of modern American theatres are superior in comfort and convenience to those of Europe, although the latter are often lavishly decorated. In America, seating, heating, ventilation, exits and fireproof construction receive the most careful attention. The largest theatre in America is the New York Hippodrome, which seats over 5,000 and is used for spectacular entertainments. The modern theatre contains all its prototypes, and the auditorium and the stage. The auditorium is now the most elaborate part of the theatre. The opening on the auditorium is from 25 to 35 or 40 feet wide and from 14 to 22 feet high. The stage is frequently twice the height of the auditorium so that the scenery (there, etc.) may be hung above the proscenium opening when not in use. The set-scene is now in very general use and to a great extent eliminates.
the necessity for a high stage. The set-scene is built so solidly and reproduces the conditions of nature with such completeness as scarcely to make any demands on the imaginative faculty of the spectators. If a room is required, a high wall with marble solidity, a chandelier hangs from the centre of the ceiling; the doors shut with an unmistakable bang; the windows open and close better than they sometimes do in actual life. In elaborate plays while pieces of scenery are raised through large transverse openings in the stage by means of platforms called bridges. These work in and out of the well or cellar, a space under the stage nearly as deep as the proscenium opening is high. Above the stages are the flies, larger lateral galleries, in which the scene-men ("fly-men") work their ropes and pulleys. Higher still is the Grid-iron, an open line of strong beams from which various borders or drops are hung. Above this is the barrelof or rigging-loft, in which are the drums, pulleys or windlasses by which the curtains and clothes are worked. With the extensive use of elaborate scenes there was a demand for rapid shifting thereon, and this led to the revolving stage, which is a circular platform about 30 feet in diameter and revolving on a shaft embedded in concrete. This circular platform is capable of holding about four sets which can be brought before the audience by revolving the platform. The sliding stage is one of double width and which is moved laterally so that on the concealed half the following scene may be set up while the play proceeds on the exposed half.

Perhaps the greatest change in the modern theatre is in the lighting arrangement due to the introduction of electricity. The lights in the troughs below are called footlights, those above border lights. There are sets of bulbs in white and in two or more colors. Dimmers are used to lower the intensity of the bulbs. All lights (except perhaps the spotlights) are now controlled from a single switchboard at the side of the stage. Recently several open-air theatres have opened in America. Some of these are of the ancient type, as that at Berkeley, Cal., while others are of the so-called garden type in which the landscape architect plays a leading rôle. There is a good example of the garden type at Vassar College. Among recent innovations in theatrical structure are the little theatres, some of which seat only 100 and the portmanteau theatre, an approach to the medieval traveling theatre, but more artistic and better adapted to the present-day intimate form of drama.

THEATRE, The American. In order to convey to the reader a fair understanding of the progress of the American theatre since 1795 it is necessary to state something about its beginnings, which, indeed, previous to 1793, are involved in much obscurity. Toney Astor, an English stroller of some celebrity, in the Southern and Middle colonies about 1730, and gave entertainments at New York and perhaps other places, and there is some evidence that a company of comedians acted plays in New York in 1732; but it was not until 1749 that an organization came into existence of which we can form any definite judgment. This company attempted to open a playhouse in Philadelphia, and Addison's 'Cato' was actually performed; but the performers were dismissed by Recorder Allen to give up the undertaking. Thomas Kean was the principal actor in both tragedy and comedy, and one Murray seems to have been associated with him in the management. Finding Philadelphia too inhos- pitable, the players went to New York, where they were advertised as the company of comedians from Philadelphia, and gave the first theatrical season of which we have any connected account. The performances were given in a convenient room in a house belonging to Rev. Van Dam in Nassau street, and extended over a period of more than a year—from 5 March 1730 to 8 July 1731. The first play was 'Richard III,' in which Kean played Richard. So far as is known, the company appeared in 5 plays and nine farces. Although Mr. Kean formally announced his withdrawal from the stage to resume his business of writing, he was with a company called the "Virginia Comedians" at Annapolis in the summer of 1732, when Lewis Hallam and his London players arrived at Williamsburg, Va. Besides Mr. Kean there were other members of the New York company among these "Virginia Comedians." Perhaps this disposes of the claim usually made for Hallam's company as being the first regular theatrical organization in America.

Lewis Hallam, who brought a company of comedians from London in 1752, was not an actor of any consequence in England, nor is it likely that his wife, known to the American stage successively as Mrs. Hallam, and Mrs. Douglass, was an actress of recognized ability there.

The Hallam company reached Yorktown in June 1752, and began playing at Williamsburg on 5 September following, the opening piece being 'The Merchant of Venice' and 'Le Cid.' The only other play the Hallam company is known to have performed at Williamsburg was 'Othello,' 9 Nov. 1752. From Williamsburg Hallam went to New York, where he arrived in June 1753, and played until the fall. Mrs. Hallam played the leading parts in both tragedy and comedy, while her daughter, Miss Hallam, was put forward in farces. Hallam seldom appeared. The great Shakespeare roles were divided between Malone and Rigby, the
laying Shylock and Lear, and the latter and Romeo. From New York the com-
tit to Philadelphia, where the engage-
s was limited to 25 performances. This t he theatre was leased to Shakespear Hall-
r, who retired with his family to where he died soon afterward.
or two after Mr. Hallam's death his arried David Douglass, who organized cal company in Jamaica in 1758 for American campaign, with Mrs. Douglass hief attraction. Besides his mother, was the only member of class company who had previously ap-
the New York and Philadelphia the-
el had already become a full-fledged rd, although he was only in his 20th year, learing parts in tragedy and comedy: Harman, as Rigby he had previously em with Malone. Mrs. Harman, who laugher of Charlotte Charclo, and a ghter of Colley Cibber, was also with any, and next in consequence to Mrs.
The low comedian was Owen Mor-
as identified with the American forays. In 1760 he was at the John street house (1760-1769). arrival in New York, Douglass had hiency in obtaining permission to open re that he had built on what was uger's Wharf, and it was not until 28 g the following spring and summer glass built a theatre at Vernon and reets in Philadelphia, which he opened 1759, and maintained with considerable r until the close of the year. He had h authority to act from Governor Denny, ompact was kept, although the opposi-
teatre was so great in the province ct prohibiting plays was passed by the to go into effect 1 Jan. 1760. After phia was closed against him, Mr. Dou-
t to Annapolis, where he played an nt. The company also performed in rialand towns, and at Newport and co in 1761. In the autumn he built an-
another theatre in New York, in what Chapel (now Beechman) street, where performances from 19 Nov. 1761 to 26 52. This ended his first attempt to he mastery of the colonial stage. In years of management Douglass had in of considerable authority, at-
such parts as Sir John Falstaff in enry IV and Mercutio in Romeo and In the latter young Hallam played the his mother's Juliet. In the last New agement, Mrs. Hallam, the wife of the tragedian, was seen in a few parts, pair separated soon afterward.
ially been understood that after his it from New York in 1762, Mr. Doug-
ot venture upon the continent again 6, when he built the Southwark The-
adelphia. On the contrary, he ap-
 Charlestone in November 1765 and there until the following April. Lewis was now the very image of the 1 of Mrs. Douglass and Miss Hallam, rners were all new to the stage. Only the new players were still with Doug-
reach Philadelphia—Messrs. nd Wall and Miss Wainwright. With the opening of the new theatre in Southwark, Philadelphia, began the theatrical organization afterward known as the "Old American Com-
pay." Lewis Hallam was once more in the lead. Mr. Morris and Mrs. Harman were again with the company. During this season a so-called comic opera, 'The Disappointment,' said to have been written by Col. Thomas Forrest, afterward a distinguished officer in the Revolu-
tionary army, was announced for performance, but it was withdrawn because it contained "local reflections." As a recompense for its with-
drawal, 'The Prince of Parthia,' by Thomas Godfrey, Jr., was produced 24 April 1767. This was the first tragedy written and played in America. The season was noteworthy for the first appearance in America of John Henry, who was the partner of Lewis Hallam after the Revolution in the management of the Old American Company.
While the company was playing in Philadelphia, Mr. Douglass built a new theatre in John street, New York, which was the second of the permanent theatres in the colonies, the South-
wark being the first. The first season at the new theatre lasted from 7 Dec. 1762 to 2 July 1763. The company alternated between these two theatres down to the time of the Revolution; but Mr. Douglass found the patron-
age of the two cities inadequate as early as 1770-71. In the latter year he made a tour to the southward as far as Williamsburg, Va., playing at Fredericksburg, Suffolk and other towns, and building a theatre at Annapolis, where the company played an engagement in the autumn of 1771. In 1773 Douglass also built a theatre at Charleston, S. C., which was the last of the many buildings he erected for theatrical purposes. The company played at Charleston from 22 Dec. 1773 to 19 May 1774. In October following the Continental Congress passed a resolution forbidding theatrical per-
formances, in view of the impending Revolu-
tion, and the organization was disbanded. Hallam went to England, where he appealed to the London public at Covent Garden Theatre as Hamlet. His most famous role was his death in Philadelphia at the close of 1774, and Mr. Douglass returned to Jamaica, where he became a magistrate.
It is an interesting fact, showing the theatric-
al activity before the Revolution, that while the American Company was acting in New York and Philadelphia in 1766-69 there was a com-
pny in the South giving performances at An-
apolis and Williamsburg. This company was known as the "Virginia Comedians" in 1768, when it gave a long season at the Virginia capital; but it assumed the name of the "New American Company" when it was at Annapolis from January to June 1769. The leading spirits of the Virginia Comedians were Messrs. Ver-
lings and Bromadge, and Mrs. Osborne, who had played with Douglass at Charleston in 1765-66, and Mr. Godwin, who was with the American Company at the Southwark in Phila-
delphia in 1766-67. All these were with the New American Company, with the exception of Mr. Bromadge. A number of bills of the Vir-
ginia Comedians at Williamsburg in 1768 have been preserved.
The most important annals relating to the American stage that have escaped the destroy-
ing hand of time are a collection of playbills
made by Thomas Llewellyn Lechmere Wall—Mr. Wall of Douglass' company. These cover 40 years of the theatrical life of the actor and are especially valuable for the complete information they afford in regard to the Baltimore Company, organized by Wall and Lindsay in 1782. Wall was perhaps the only member of the American Company who remained behind when Douglass returned to Jamaica in 1774. He was also the only manager who undertook to conduct the theatre before the close of the Revolution. In 1781 he was at Annapolis giving entertainments with the assistance of his wife and daughter when the French army was on the march to Yorktown. For one of his performances at that time he succeeded in securing the services of the band belonging to the regiment of Count de Chautelet. Later in the year he went to Baltimore, where he repeated his Annapolis entertainments, and in conjunction with Adam Lindsay, a tavern-keeper at Fell's Point, built a theatre, of which Lindsay and Wall were the nominal managers, with Wall as the stage director. The company was formed on what was afterward known as the "commonwealth plan." The theatre was opened 15 Jan. 1782, and continued without interruption until 9 July—42 nights. In all 19 plays and 14 farces were produced, and the total receipts for the season were $14,209, an average of $338.50 per night. With the exception of the Walls the players were all new to the American stage, and, it may be assumed, were all amateurs.

The second season at the Baltimore theatre extended to 7 Feb. 1783. On the third night of the season at Baltimore, Mr. and Mrs. Dennis Ryan appeared in "Douglas." Ryan dominated the company from the outset, and when Wall retired from the management, 7 Feb. 1783, he assumed the reins, keeping the theatre open from 11 February to 9 June. From Baltimore Ryan carried his company to New York and opened the theatre in John Street. Wall was with Ryan's company, which remained until the British evacuation, giving two performances in October 1783, while the military players gave a performance for Mr. Ryan's benefit. In the winter of 1782-3, William Dunlap opened the Baltimore theatre, the season extending from 7 Dec. 1783 to 14 Feb. 1784. The only noteworthy event of this season was the first production of the "School for Scandal" in America, 3 Feb. 1783, with Mrs. Ryan as Lady Teazle. After the close of the Baltimore season in 1784, Dunlap took the company to Richmond, where he played a long engagement. Mr. Heard, who was the original Sir Peter Teazle in this country, joined the forces of Hallam and Henry; the other members of the organization found professional employment in the South during the rest of the century.

After the Revolution both Lewis Hallam and John Henry were almost continuously in control of the theatres that had been built by Douglass; but Hallam was the first to present a company of comedians to the New York public, opening the John Street Theatre 24 Aug. 1785. Hallam proposed a partnership with Henry, and the firm of Hallam and Henry ran the theatre that fall, but at the end of the season the theatre was placed in the hands of a manager, and during the next seven years, came into existence. The John Street Theatre reopened under their management 21 Nov. 1785. Henry engaged in England a number of capable actors and actresses whose names are part of the history of the American stage, while Wignell not only succeeded in building in Philadelphia the first really handsome and complete theatre in the United States, but put into it the best company of actors and actresses as yet been tempted to cross the Atlantic.

An incident of the Hallam and Henry partnership, previous to the reorganization of the company, that needed to be noted here is the production of the first American comedy, "The Contrast," by Royall Porter. This play was first produced in New York 18 April 1787, was written for Wignell, who wished to play a Yankee character. Wignell's Jonathan deserves remembrance as the forerunner of the long series of stage Yankees that afterward became popular with American audiences. The comedy was printed in Philadelphia, and was often played by strolling companies before the close of the century.

The only really important recruits engaged by Mr. Henry in England were Mr. and Mrs. Hodgkinson of the Bath and Bristol theatres, and Mrs. Wrighten, who had long been a favorite singer and actress at Drury Lane. Hodgkinson was a man of great talent and versatility, and the best actor seen in America up to that time and for many years afterward. He made his début as Don Felix in 'The Wonder,' at Philadelphia, 26 Sept. 1792, succeeded Henry as one of the managers of the Old American Company in 1794, and was active as actor and manager in New York until after the opening season at the New Theatre in 1798. Mrs. Hodgkinson, known at Bath and Bristol as Miss Brett, was an actress of merit, and in this country eclipsed both Mr. Henry and Mrs. Hallam, the wives of the managers by whom the Hodgkinsons were engaged. Mrs. Wrighten was known in America as Mrs. Pownall. She died at Charleston in 1796, after introducing her two daughters to the stage in this country. One of them, Caroline, married Alexander Placide, who had been a rope dancer in England. She was the mother of the famous Placide family of actors. It was during this period that William Dunlap became prominent as a dramatist and adapter of plays. His first comedy, 'The Father,' was produced at the old John Street Theatre, 7 Sept. 1789. Dunlap became associated with Hallam and Hodgkinson in the management of the New York company in 1790, and he was afterward for a brief period the sole manager of the New Theatre, better known as the Park.

After leaving the Old American Company in the beginning of 1792, Thomas Wignell associated himself with A. Reinagle, a musician who came to America in 1786, in the project of building the New Theatre in Philadelphia, afterward known as the Chestnut Street Theatre. The theatre was modeled after the theatre at Bath, and was ready for use when, owing to the yellow-fever epidemic it was not opened by the company of players engaged by Wignell until 17 Feb. 1794. Among the actors and actresses comprising the Philadelphia company were Mr. Fennelly, the young tragedian of much promise, Mrs. Wignells, a daughter of Mr. Wignell, Mrs. W. Keys, and Mrs. W. Talfman. Miss George, who was the wife of the lawyer James Oldmixon, was known to our stage as Mrs. Oldmixon. This company remained intact without any im-
changes or additions for three years, alternately in Philadelphia and Balti-
mie in the autumn of 1796 Mr. Wigg-
spent three important recruits from Eng-
Mr. Merry, the famous Miss Brunton
theatre, who had become the

90 John Bigmall and Thomas Ward
re the managers of a company called
'Continental'. The organization con-
ed its existence for many years, its
xtending from Richmond and Norfolk
eston. Bignall, who was held by his
admirers to be the best actor on the
continent, died in 1794. His real name
Moneypenny, and he had been a stroller in
England in the same company with William
Warren, of the Philadelphia theatre. After
Bignall's death West became the sole manager
of the company and piloted it over the South-
ern circuit for a number of years. In 1795
there was a rival theatre in Charleston, con-
ducted by Mr. Jones, who had been previously
at the Boston Theatre. His principal actress
was Mrs. Whitlock, who had made her debut
in the Philadelphia company. A Frenchman, M.
Sollee, succeeded to the management of this
theatre, and organized a company in Boston to
play in Charleston for the season of 1795-96.
Mr. and Mrs. Whitlock, Mr. and Mrs. Placide
and Mrs. Arnold — afterward Mrs. Poe and
the mother of Edgar Allan Poe — were in the
company.

The prosperity which had given to America
three splendid theatres within five years — the
Chestnut Street in Philadelphia, the Park in
New York, and the Boston Theatre in Federal
street, Boston, rebuilt immediately after its
destruction in 1798 — was followed by a period
of depression that was severely felt over all the
country. At the close of the season Wignell
was in jail for debts incurred through the
Philadelphia theatre, and Dunlap, who had
undertaken the sole management of the New
York theatre to retrieve previous losses in New
York and New England, lost his entire private
fortune in the venture. Mr. Barrett was in-
duced to undertake the management of the
new Boston Theatre in 1799, but he failed dis-
mally.

In all these cities theatrical enterprises were
experimental for several years, but in every
case a manager was finally found in the local
company who succeeded in placing the theatre
on a sound business and artistic basis. Mr.
Warren, after he became Wignell's successor in
Philadelphia, associated with himself in the
direction of the Chestnut Street Theatre a
popular young member of the company, William
Burke Wood. This partnership lasted until
1825. In New York the young tragedian Cooper
retrieved the fortunes of the Park Theatre, and
made the house a paying one for a period of
years. In Boston, Snelling Powell, a brother of
Charles Powell, secured control after other
ttempts had failed, including the assumption of
the management of the Boston Theatre by
Charles Whitlock in 1800. John Bernard, an
English actor of some repute who joined the
Philadelphia company in 1797, was for a while
Snelling Powell's associate in directing the
Federal Street Theatre; but for many years
Powell's partner was Mr. Dickinson, who
was an actor of moderate ability, but a man of
sound judgment and an excellent manager.
These were the dominating theatres in the
United States during the first quarter of the
century, and their influence in giving tone and
character to theatrical enterprises in the country
was felt down to 1850.

The Old American Company was designed
to be permanent in organization, but all the
early managers, from Douglass to Wignell and
Hodgkinson, aimed at controlling the
playhouses modeled after the provincial circuits
in England. The building of the new theatres
in Philadelphia, New York and Boston resulted in
giving companies that were permanent in
organization permanence of home. These were the real stock-company days, but a tendency toward the star system was manifested almost from the outset. In 1796 Mrs. Whitlock played what was essentially a star engagement at the Boston Theatre; it was limited to 12 nights, for which she was paid $450 and allowed a benefit. Hodgkinson played star engagements in all the leading cities between 1798 and 1805, and Cooper followed Hodgkinson's example, and was a star from youth to old age. But the first star of all the many, or of the few in the American theatrical firmament was George Frederick Cooke. He was the first English actor of great reputation who came to America to play the leading roles of tragedy and comedy with the stock companies in the principal cities. In view of this the star system, as it ruled in the American theatres for the next half century, may be said to date from his appearance here in 1810-11.

Simultaneously with Cooke's performances in Philadelphia, New York and Boston were the star engagements of John Howard Payne. Cooke played three engagements in Philadelphia—in all 39 nights. His highest receipts for any one night were $1,473, but his average for the last Philadelphia engagement of 12 nights in 1811 was $807.50. Payne played to an average about the same time of $442, while Cooper's Philadelphia average was $539. Young Payne's popularity rapidly diminished, and in 1812 he performed to receipts that fell as low as $235. After Cooke the next English star to appear in America was Holman, in 1812; but he came at a time of serious depression in consequence of the war with Great Britain, and the impression that he made fell far below his expectations. Then came Inceleton and Phillips as musical stars, and after them the Wallacks, Henry and James W., and finally, to close the first decade of the star system in America, 1810-20, Edmund Kean. The great English stars who came to this country during the next three decades were Junius Brutus Booth and William Charles Macready, 1820-30; Fanny Kemble and her father, Charles Kemble, and Charles Kean, 1830-40; and Tyrone Power, James R. Anderson and Macready, again in the fullness of his fame, 1840-50. This long period had developed only two American stars of surpassing brilliance—Edwin Forrest and Charlotte Cushman.

The century opened with about half a score of theatres in the leading American cities, only three of which, as already described, were worthy of the name or of the drama. Between 1800 and 1850 about 20 theatres were built in New York, none of them superior to the Park, and only one, the Bowery, in any sense its rival, until the Alhambra opened in Chamber-street in the last decade of the epoch. The only new theatres of importance in Philadelphia during the period were the Walnut Street and the Arch Street theatres, the former erected to a contract of $90,000, by Edward Lathrop, and the latter built in 1826. The theatres built in Boston in these 50 years were the Tremont, the American Amphitheatre, opened the Warren and National Kimball's Museum, the Lincoln and the Harvard Athenaeum. Baltimore had nothing better than the old Holliday Street Theatre during this epoch.

Washington was without a place of amusement worthy of the drama until 1835. The builder of the period in the South and west was James H. Caldwell. He built the American Theatre in New Orleans in 1821, afterward erected the Camp Street and Ph Street theatres. Mr. Caldwell also built in Cincinnati, Saint Louis, Natchez, New Orleans and Petersburg. Another John S. Potter, was concerned in the many, or of the few in the American theatrical firmament was George Frederick Cooke. He was the first English actor of great reputation who came to America to play the leading roles of tragedy and comedy with the stock companies in the principal cities. In view of this the star system, as it ruled in the American theatres for the next half century, may be said to date from his appearance here in 1810-11.

Simultaneously with Cooke's performances in Philadelphia, New York and Boston were the star engagements of John Howard Payne. Cooke played three engagements in Philadelphia—in all 39 nights. His highest receipts for any one night were $1,473, but his average for the last Philadelphia engagement of 12 nights in 1811 was $807.50. Payne played to an average about the same time of $442, while Cooper's Philadelphia average was $539. Young Payne's popularity rapidly diminished, and in 1812 he performed to receipts that fell as low as $235. After Cooke the next English star to appear in America was Holman, in 1812; but he came at a time of serious depression in consequence of the war with Great Britain, and the impression that he made fell far below his expectations. Then came Inceleton and Phillips as musical stars, and after them the Wallacks, Henry and James W., and finally, to close the first decade of the star system in America, 1810-20, Edmund Kean. The great English stars who came to this country during the next three decades were Junius Brutus Booth and William Charles Macready, 1820-30; Fanny Kemble and her father, Charles Kemble, and Charles Kean, 1830-40; and Tyrone Power, James R. Anderson and Macready, again in the fullness of his fame, 1840-50. This long period had developed only two American stars of surpassing brilliance—Edwin Forrest and Charlotte Cushman.

The century opened with about half a score of theatres in the leading American cities, only three of which, as already described, were worthy of the name or of the drama. Between 1800 and 1850 about 20 theatres were built in New York, none of them superior to the Park, and only one, the Bowery, in any sense its rival, until the Alhambra opened in Chamber-street in the last decade of the epoch. The only new theatres of importance in Philadelphia during the period were the Walnut Street and the Arch Street theatres, the former erected to a contract of $90,000, by Edward Lathrop, and the latter built in 1826. The theatres built in Boston in these 50 years were the Tremont, the American Amphitheatre, opened the Warren and National Kimball's Museum, the Lincoln and the Harvard Athenaeum. Baltimore had nothing better than the old Holliday Street Theatre during this epoch.
delphia, by James H. Wallack in New York, and later Moses Kimball in Boston, stock companies were maintained. Later on, Lester Wallack, Augustin Daly, M. H. Mallory, Daniel Frohman, Charles Frohman and A. M. Palmer in New York, and R. M. Field in Boston, kept together for years organizations which were more nearly the permanent system. Throughout the country generally the theatres for a while employed stock companies, but mainly for the purpose of supporting traveling stars. This continued until after the close of the Civil War, when the impetus given to business enterprises of all kinds was felt in renewed theatrical activity not only in the cities, but all over the country. What is known as the combination system (that is, a traveling company made up of a star and a supporting company), which began about 1869 and reached its highest development before 1876, involving the destruction of the stock companies in all except a few theatres, was the consequence of this theatrical revival. Nearly every inland town and city from Maine to California built a theatre, with the expectation that traveling companies would occupy it at intervals. The demand thus created could be supplied only by the combination system.

One of the first results of this new state of things was the banishment from the managerial office of all, or nearly all, the actor-managers. Their places were filled by business men, who, while they may have lowered, in a sense, the artistic character of the theatre, have raised its financial standing to a point which, during the first century of its existence, seemed beyond its reach. The theatre in America was no longer a haphazard thing, living from day to day on uncertainty. It became a business conducted on the principles which govern other forms of commercial enterprise, and is as stable, as sound and as certain of adequate rewards as any. Indeed, so abnormal has been the development of the business character of the theatre that it has excluded from general managerial attentiments everything else. Very few of the managers throughout the country ever undertake the original production of plays, or take the trouble to acquire the artistic knowledge requisite to their business. Chicago and Boston, are the play-producing centres. A few New York managers and the play-producing stars select and bring forth all the plays and gather together all the companies which, supplemented by the imported attractions, keep the theatres of the country supplied with entertainment during the season. The advantage of this system is that playgoers everywhere are furnished with well-trained and perfectly equipped companies, appearing in plays which have been tried and found to be worthy. The local manager, free from the worries and cares incident to stage-work, devotes his time and attention to the patronage of the patrons at the front of the house, and to the strict conduct of business there. The results are well-regulated and comfortable auditoriums and good order in all the business departments of the theatre.

A remarkable aspect of the American theatre, from a commercial point of view, is the enormous profit it has yielded and continues to yield to home and foreign celebrities. Among American actors, Edwin Forrest acquired and left behind him a great estate, from the remnant of which was established the Forrest Home, near Philadelphia, a retreat for aged actors, noble in its purpose and efficient in its benefaction; Charlotte Cushman, resting for long periods in England and Italy, left a fortune of $600,000; Edna Booth, having made and lost more than one romantic romance of financial successes in his declining years, and left $750,000 to his heirs, after having founded the Players' Club at a cost of $200,000; Mary Anderson retired from the stage after a few seasons of brilliant and uninterrupted triumph, to enjoy a happy marriage in her youth, her labors having brought her a fortune of $500,000; Joseph Jefferson, blessed with that continuous vitality often found among the children of the stage, had in 1902 acquired a fortune of $1,000,000. Among foreign actors, William C. Macready owed to America the realization of his dream of retirement from a profession he affected to loathe; Sarah Bernhardt acquired here a fortune which enabled her to defy the authority of the house of Molière and to establish a theatre of her own in beautiful Paris; Tommaso Salvini, adding his great earnings here to his modest ones in other lands, became the richest actor Italy has ever known; and Henry Irving has found in his frequent visits to our country a public eager and willing to fill his coffers to overflowing with the rewards so justly due to his unequalled managerial achievements and to his undoubted genius as an actor. In the moving picture field Charlie Chaplin passed everybody else, and his income is stated to be fully $1,000,000 annually. The list of the well-rewarded favorites of the public might be greatly extended, but this glimpse of results is sufficient to make clear the profits and prosperity of the American stage, and to indicate the extent of its commercial advancement during the century.

The development of the theatre in all its departments, especially since 1860, has been vast. From not more than 100 in 1800, and fewer than 800 in 1860, the number of actors and actresses in the United States increased so immensely that in 1888 it was estimated at 4,500, and now probably exceeds 10,000. This number represents only New York, Chicago and Boston; it does not include the managers, who number several hundred, as compared with 25 or 30 in 1850 and six or eight in 1800. If the exponents of variety and vaudeville and the other employees in the amusement business are included, the number of people who gain a livelihood by giving public entertainments will not fall below 30,000; including stage hands and all the persons who derive their support from the theatre, the number may be roughly estimated at 100,000. This vast army of workers is well organized, generally well paid and reasonably prosperous. It has numerous charitable and social organizations, which are models of their kind. The Actors' Fund, the Actors' Order of Friendship, the Players' Club, the Green Room Club, the Lambs' Club, the Professional Women's League, are institutions of which any profession might well be proud; and there are numberless others of equal merit supported by the amusement makers of the United States. There are about 1,000 regularly organized theatrical companies on tour through the United States during the
season, and the number of theatres of all kinds is 10,000.

In New York City there were in 1918, the following theatres: in Manhattan borough, about 50 theatres worthy of the name, the largest being the Hippodrome (seating 5,000), followed by Metropolitan Opera House (3,500), Metropolitan Opera House (3,566) and Century (2,800); and about 50 vaudeville and motion picture houses of the best class, the larger ones being the Old Academy of Music (3,400), Strand (3,300), Audubon (2,653) and Lexington (2,559). In Brooklyn borough there are about a score of good theatres and some 80 first-class vaudeville and motion picture houses, the largest being the Halsey, Keeneey, Ridgewood and Prospect, each of them seating 2,500. There are perhaps a thousand other minor theatres and picture houses.

The improvement which has taken place in the construction of theatres in America within the last 35 years is worthy of especial notice. The tragic disaster in Brooklyn on the night of 6 Dec. 1876 awakened the attention of managers and of the public authorities in the different States to the flimsiness of construction which marked even the best theatres of the period. The result was the passage of new and most stringent laws, involving requirements which, while they seemed onerous, perhaps, have resulted in giving to America the best and safest theatres in the world. Even the older theatres, built before the new regulations, have been so altered under the direction of the authorities that they are now comparatively free from danger. In New York, where these regulations are perhaps the strictest, there is a larger number of absolutely safe theatres than in any city in the world; while for beauty and convenience combined with safety it is impossible to find elsewhere such theatres as the Century, Strand, Gaiety, New Amsterdam, Victoria, New York Knickerbocker Empire, and Metropolitan Opera House. The older houses pass away as they are replaced by absolutely fireproof structures if replaced at all.

Perhaps the most marked change that has taken place in the American theatre during the last half century is in the character and number of its patrons. Attendance upon the theatre was looked upon even 60 years ago by at least seven-tenths of the people of the United States as almost a sin. The fashionable ungodly and the lowest and most depraved made up the audiences. We have seen how, in the Revolutionary period, theatres were closed by act of Congress, doubtless because, in those days of danger, the fathers of our country felt that they would help their cause by propitiating the Almighty, who was supposed to frown upon godless amusements. But in the last three or four decades this unreasonable prejudice against the most enjoyable and least harmful of amusements seems to have so materially lessened that it is estimated by a good authority that not more than one-tenth of the people refuse to patronize the theatres as a matter of principle. It is true that a clergyman now and then takes hold of the stage in the old-fashioned, puritanical way; but his words, in all likelihood, fall upon ears that the night before were listening to the sermons of 'Camille' or were taking in the laughter-provoking eveth lines of 'The Private Secretary.' Indeed, element of moral usefulness in the theatre no longer successfully divided.

The phenomenal development of the modern picture theatre has made many changes in stage since the dawn of the 20th century. Theatre managers who clung to the remodeled productions of the old school in business, and there were years of dark and numerous failures. Some tried to look back the crowds by going in the limit on plays exhibiting crime, and for a few years there was scant decency in many American playhouses. When this failed, the more sensible managers accepted the moving picture as an adjunct, and many utilized it as a vaudeville feature. The war also had a disintegrating influence; many of the younger actors went uniform and were lost to the profession. Plays were called for, and a few strong productions resulted. The number of new pictures produced in America is small, however, as only 100 are staged annually in New York City, perhaps a dozen in other cities. Those that run more than 100 nights are voted to be successes. The remainder of the performers in New York are either reproductions of European authors, or old plays, of which it is possible to catalogue the best plays that have been, and go, though many of them will be fo by reference to Drama. **THEATRE, STAGE MECHANICS OF.**

A stage mechanism is that visible part of a platform advanced at the rear of an auditorium which is concealed when not used and can be pulled up within it or opened out of reach. The stage and all that may be arranged upon it should be conservative of the lines of sight and bearing of the spectator and auditor.

From earliest times such an elevation or platform, or a depression or pit, had been usual for representation or entertainment before spectators. The earliest choruses were in the circle or pit evolved into the Greek classic theatre, with its scena or house or scene or stories, which filled the background of the stage, the action being within the semi-circular arch or pit in front.

The mechanism of the ancient theatre was very exact in every respect. The religious character of the performance established fixed and usually religious meanings for everything done or said in the play. The scenery was probably limited to painted curtains at the back and revolving triangular prisms at entrances. Machinery for startling effects was, however, usual. The Roman invasion resulted in the extension of the stage more and more forward, until it became a platform sufficiently large to hold the chorus and entire group of performers.

The ancient Greeks bore the same relation in art and theatricals to the world of their time as the modern French do to-day; consequently even the traveling companies of the various nations followed crudely the methods of performances usual with the Greeks, and, indeed, the general conduct and character of the modern theatre is in many respects followed the original classic traditions: The entrances and exits on the modern stage, much of the symbolic values of parts of the stage and the arrangement of scene movement are directly inherited from the old Greek theatre: In later medieval times a portable stage or cart was used. But little advance can be noted in stage mechanism until after the time of Shakespeare and of Molière, when modern inventions began to appear. Richard Wagner and the Germans revolutionized stage settings and theatrical architecture, as notable in Wagner's Theatre in Bayreuth and the Burg Theatre in Vienna. The German's leadership in applying science to and otherwise improving stage mechanisms has been followed by every European nation, notably in England, by Sir Henry Irving, whose system of lighting is especially remarkable in the conveyance of the feeling of atmosphere to the senses of the spectator. In America Steele MacKaye was progressive in improving the mechanism of the stage. Later, the proprietors of the New York Hippodrome developed most elaborate and complicated mechanisms for spectacular productions.

While the use of gas and movement of scenery in grooves had been universal during the past century until 1875, yet in many theatres today such modes of lighting and scene shifting are still retained. In the theatres of to-day, where electricity and the most modern machinery are employed, the following are the terms and uses of the stage machinery:

**THE STAGE.**

**Rake, Thr.**—The rake is one of the stage floors, from the front frame, used to raise or lower the floor. It is generally placed with a slight downward slope toward the audience. The rake of the stage is the portion of the stage which is raised or lowered to the depth of each piece of the scenic framework or of the curtains. **Pres. thr.**—The architectural arch and spandrel which supports the curtain, as it were, a massive brace to the picture which the curtain reveals.
THEATRE, STAGE MECHANICS OF

It is assumed that there are four entrances. Those are counted 1, 2, 3, 4, from down stage up.

N. B.—Though there may be but one entrance on one side of the interior setting—direction may possibly be given to set a fireplace or window R. (right second); that is to say, where right second entrance should have been had it existed.

EXPLANATION OF THE ABBREVIATIONS.

| R. 1. E. | Right first entrance. |
| R. 2. E. | Right second entrance. |
| L. 1. E. | Left first entrance. |
| L. 2. E. | Left second entrance. |
| L. 3. E. | Left third entrance. |
| L. 4. E. | Left fourth entrance. |
| C. | Centre of stage. |
| D. | Down centre line. |
| U. | Up centre line. |
| R. | Right centre line. |
| C. | Centre line. |
| D. | Down right centre line. |
| U. | Up left centre line. |
| L. | Left centre line. |
| D. | Down left centre line. |
| U. | Up right stage. |
| L. | Left down stage. |
| R. | Right down stage. |

THE SCENEY.

WING, A.—A single piece of scenery, ordinarily 5 feet 4 inches wide by 18 feet high.

PLAT, A.—A double wing, either hinged or battened together.

BORDERS.—Stripes of canvas hung crosswise above the stage by means of a set of lines. These may either represent the sky, the branches of trees and foliage, etc.

CEILING.—A square of canvas set to light frame of wood which is lowered by means of a double set of lines—one set “up stage” (back of stage), the other “down” (front of stage), until it rests squarely upon the interior set.

BOX SET, A.—A complete interior setting.

DROP, A.—A large canvas representing the back-ground of the setting. In the case of a complete exterior setting, the drop extends the full width of the back of the stage; in the case of an interior setting, where, for example, only a window and a door present a view of the outside, the drop may be much narrower.

JOG, A.—A narrow drop, hung by a single line.

JOG, A.—A narrow piece of scenery, wherein two flats or wings of an interior setting may be joined, either for extension or to form a quadrangle.

RETURN PIECES.—Two wings affixed to an interior setting, which turn off stage, back of each side of the proscenium opening.

MACHINES.—Either a wing, or two wings hinged together, set back of some opening, window or door.

MASKING PIECES.—A piece of scenery, drop or wing, set behind an opening to conceal either the scenery or the bare stage immediately behind it.

BRACES.—Two narrow strips of wood, five feet long, either permitted to slip alongside each other or made fast to each other by means of a turn-screw once the desired extension is reached. The top end has a small iron grip attached, in the shape of a ram’s horns; the lower has a narrow short blade of steel intended to trail flat upon the ground and containing a hole sufficiently large to admit a screw-pin. The grip at the top of the brace is first introduced into a screw-eye attached to the back of a piece of scenery; then the desired length of the brace is secured by means of the centre screw, so that it reaches the ground obliquely; lastly, then, the screw-pin fastens the brace securely to the ground; and thus may scenery be held in position.

LASHLINES.—Pieces of light rope fastened at the side of the wooden frame near the top of a wing or flat, for the purpose of fastening this wing or flat to the next one.

THE LIGHTS.

FOOTLIGHTS (of the stage).—Rows of lights along the front edge of the stage.

BORDER LIGHTS.—The illumination of a series of electric bulbs in a long tin reflector, extending the entire width of the stage and hung up in the air, by means of a set of lines, back of the canvas borders. There are usually four border lights, more or less, according to the depth of the stage and the style of the play. No. 1 border light is hung close to the curtain down stage; No. 4 is hung well back of stage; the other two, Nos. 2 and 3, occupy the intersecting positions.

STRIPS.—Several electric bulbs set to a narrow strip of wood, varying in length according to necessity—usually
our feet long, which may be movable and hung anywhere back of the setting.

BUNCH LIGHT.—Several electric bulbs inside of circular and moveable trans-fuser.

CUSHION. An oval, sheet-iron box with an open front 18 inches by 14 inches, set upon a long steel rod encased in a ring, for the purpose of raising or lowering. The box is painted white within and contains carbon holders and carbon sticks—and is for the purpose of throwing a white hood of white or colored light.

MINIATURE.—A light frame of wood, the size of the opening in the back of which is covered with a thin sheet of gelatine; the gelatine being colored either red, blue, green, amber, etc. Thus sunset glow may be thrown, or light effects may be secured by the use of a different medium.

LENSES.—A sheet-iron hood, set to a steel rod and operated in the same way as the box calcium, but for the purpose of throwing a shaft of light: that is, a moonbeam, a sunbeam.

POCKETS.—Concealed, safety, steel pockets in the floor of the stage, on 18-inch rods, for the purpose of converting wires, leading to calculi, bunch lights, etc. Usually there are three pockets on each side of the stage.

THE SWITCH-BORD. —The electric board—usually on the prompt side—where all connections are made for the electricians to operate all the lights from a single place.

THÉÂTRE FRANÇAIS, tük-àr frán-sā. See Comédie Française.

THÉÂTRE LIBRE, lē-br. in France, a theatre for the populace, subsidized by the government and admission to which is practically free to all citizens of the republic.

THEATRICALS, Amateur. See Amateur Theatricals.

THEBAN CYCLE. A series of old Greek epic poems dealing with Theban legends. They include 'Thebaid,' which tells the story of the house of Labdacus and the attack of the Seven on Thebes; the 'Epigone,' which relates the capture of the city, and the 'Edipedia,' which tells the story of the hero Oedipus. The poems average about 60,000 lines each.

THEBES, thēbz (Egyptian Net, the No of the Bible; Greek Thebai or Dióspolis), Egypt. a famous ancient city, whose ruins are situated on a high mound, about eight miles south of Cairo, near the modern villages of Karnak and Luxor. The ruins are among the most magnificent in the world. The largest is the great temple of Ammon at Karnak on the east bank of the river. It was begun during the Twelfth Dynasty and enlarged by kings of the succeeding dynasties down to the time of the Ptolemies. It stands within a large enclosure which also contains several minor temples. An avenue of sphinxes leads to the main entrance, which is a huge pylon, 142 feet high. This leads into a court measuring 270 by 338 feet, and traversed by a double line of colossal columns. A second pylon leads into the great hall or hypostyle, whose roof was supported by 134 columns in 10 rows. The columns of the two courts are 28 feet high and 33 feet in circumference. All were brilliantly painted and sculptured, and many of the columns still retain their bright colors. Other pylons lead into the inner courts, one of which contains two obelisks 96 feet high. A colossal statue of Ozymandias is on one of the obelisks. The entire structure is 1,200 feet long and about 350 feet wide. At Luxor, also on the east bank of the river, and a short distance south of it, there are fine ruins of another temple of Ammon, built by Amenophis III and his successors. On the west bank the principal ruin is the Tombs of the Kings, hewn into the rocks of the hills; the Ramesseum, or Memnon, 64 feet in height; these is the celebrated 'vocal statue;' and other remains of tombs and scattered over the neighborhood on the river. After the expulsion of Thespis became the capital of Egypt remained so until the beginning of the 1st Dynasty. It declined in importance with the exception of a short period in the 7th century B.C., when it was again a capital. The Ptolemies repaired its gates and roads, and did the Romans. An earthquake worked havoc with its ancient ruins. Since then Thespis is nothing more than a collection of ruins inhabited by a few families of Felahin, who obtained a precarious livelihood by guiding summer visitors to the ruins or rifling the tombs for antiquities. See Davies, N. de G., 'Five Theban Temples' (in Archæological Survey of Egypt, 1888); Bulletin of the Metropolitan Museum of Art (New York 1916); Le Fargue, H., 'The Theban Temples;' Les Camisard, A., 'Ancient Thebes' (Berlin 1850-59); Mariette, A. E., 'Monuments of Upper Egypt' (London 1877); Naville, H., 'Deir El-Bahari' (London 1894-1906), also Egypt.

THEBES (Greek, Thebai), Greece, the principal city of Boeotia, was situated on an elevated plateau, south of Mount Phæa, now being occupied by the unimportant town of Thiva (pop. 3,500), at the juncture of the road leading north from Athens, the transversal road leading from the Stratheikon to the coast of the Gulf of Corinth to the west. It was one of the most celebrated cities of Greece, the birthplace of Pindar, Epaminondas, and Pelopidas. Cadmus, leading a Phoenician colony, is said to have founded the city by his son. It was near the site of the city of Cleon (1500 B.C.). The principal name in the history of Thebes is that of Oedipus, the recorded event in his history took place B.C., when Philolaus drew up a code for the Thebans. During the Persian War the Thebans rendered important services to the Spartans; but they afterward, through jealousy of the Spartan ascendancy against them in 382 B.C., though peace then prevailed. Phæbus, a Spartan commander, treacherously put himself at the head of the Cadmeia, which was held by the Spartans until Pelopidas and Epaminondas led a conspiracy which resulted in the tyrants' defeat (536 B.C.). Open war now raged between Sparta and Thebes, which in the humiliation of the former by the defeat of Leuctra (517). Thebes, brilliant leadership of Epaminondas was at this time at its height. Hence supremacy departed when the former the battle of Mantinea (362 B.C.), rise of the Macedonian power. Thebes...
THECLA — THEISM

n alliance with the Athenians and other s against Philip. After the battle of thea (338 B.C.) it was obliged to receive a
lonian garrison. On Philip's death an action broke out in Thessaly and an at-
was made to drive the Macedonians from thea. But Alexander hastened to their
captured and destroyed (336 B.C.) the
and reduced the inhabitants to slavery.
years afterward Cassander rebuilt
; but it never recovered its former im-
cence. In the 4th century the Romans against
ces, king of Pontus, it joined the latter:
gratitude to Athens, and was severely
ed by the Romans under Sulla. From
me the Thebans as a power in Greece ully disappear from history. In the 11th
th centuries it was again in a prosperous
ion as a result of the introduction of silk
cturing. It was sacked by the Normans.

(Leipzig 1879); Stern, E. von, 'Ge-
de der spartanischen und thebaischen
onic' (Dorpat 1884).

THEISM, the doctrine of the existence of a God or Gods. It may take the form either of monotheism or polytheism and is opposed only
to atheism, which denies the existence of such
divine beings. From its use to express the
belief of cultured Christian peoples, the term
has been given a more restricted meaning.
Thus, theism has been identified with monothe-
ism, as implying belief in one God, and hence
is distinguished from all forms of polytheism.
Further, theism is distinguished from pantheism.
On the one hand and deism on the other.
Pantheism (q.v.) merges God with the world-
process and thus practically denies his personal-
ity. Deism (q.v.) emphasizes the personality
of God, but conceives him as existing apart
from the world of his creation. Theism
endeavors to rise above both of these extremes
and embrace the truth contained in each. On
the one hand it maintains the personality
of God and his transcendence of the world. On
the other it insists upon the immanence of God,
upon his presence in the world as the all
powerful and life-giving agency. Thus the God of the-
ism is at once the Author and the Preserver of
the world. In every age and among every
people of history some form of theism is to be
found as the basis of religious observance. This belief is refined and developed with the pro-
gress of thought and civilization and the direc-
tion of this development is generally in the line
above mentioned, from polytheism to mono-
theism, and on to a comprehensive theism.
Thus the traditional polytheism of Greece broke
down under the influence of philosophic re-
spection; but this reflection itself culminated in the
theistic philosophy of Aristotle. As the theo-
logical basis of religion and the ultimate explana-
tion of the universe, theism has always had a
prominent place in systematic reflection. In the
earlier centuries of the Christian era it was the
subject of supreme importance and the best effort
of theologians and philosophers was given to
its discussion and exposition. As a result, cer-
tain proofs for the existence of God were for-
mulated, the most important of which possess
considerable historic interest. We may men-
tion three of these arguments: (1) The Onto-
logical argument, first proposed by Anselm, in-
ers the existence of God from the idea of a
most Perfect Being. The presence of this idea
in the human mind entails the existence of such
a Being, for existence is one of the perfections
necessarily contained in the idea of Most Per-
fect Being. (2) The Cosmological argument
was adapted from Aristotle, and proceeds upon
the principle that every effect must have a
cause. The world is such an effect. It is im-
possible to suppose that the series of natural
causes goes back to infinity, and consequently
we are compelled to assume the existence of a
Divine First Cause, adequate to account for the
existence of the world. (3) The Teleological
argument is based upon the evidences of design
in the world, and infers therefrom the exist-
ence of a designing mind as its Author. These
formal arguments were subjected to a destruc-
tive criticism by the philosopher Kant at the
end of the 18th century. He attempted to show
how they depended one upon the other, and all
contained contradictions and inconsistencies.
Kant held that the moral argument was the only
possible proof for the existence of God. This

IECA, théék'la, Saint, the female pro-
yr of the Church. Born of a noble
of Iconium in Lycania, she was con-
bys the preaching of Saint Paul, followed
Antioch and devoted herself to a life of
ity. As a consequence, she suffered a
of persecutions from her fiancé and her
, who eventually denounced her to the
ites as a Christian, and she was thrown
wild beasts in the theatre; but the fierce
is refused to hurt her, and she also es-
scathed from the flames to which she sub-
sequently exposed. After the death of
Paul she lived to a ripe old age in a cell
ecula. She is the heroine of a Chris-
ian of the 2nd century called 'The
Paul and Thecla.' (See Apocrypha).

acklagegende' (1877); Schmidt, C.,
Pau1i' (Leipzig 1905); Ramsay, 'The
1 in the Roman Empire' (London 1893).

IECOPHORA, a suborder of Chelonia
containing the sea turtles (E). It is defined by anatomical charac-
most conspicuous of which is the ex-
: possession of horny epidermal shields
tes on the shell. Consult Gadow, 'Am-
and Reptiles' (New York 1901).

IEFT, is a term sometimes used as sy-
ous with larceny, although it is less tech-
and a wider term, and signifies the secret
olious abstraction of the property of
r with the intention of converting it to
er's use, and without the consent of the
. See LARCENY.

IEINE, CH₄NO₃, more often called caf-
an alkaloid found in tea, coffee, Para-
tea, guarana, etc. It may be prepared
tically by action of methyl iodide on
mine. Usually obtained from tea dust
contains from 2 to 4 per cent white
needles, slightly soluble in cold water and
possessing a somewhat bitter taste, and
ng salts with acids. It is used in medicine
eve stimulant.
THEISS — THELLUSSON

argument maintains that the existence of right and duty presupposes the existence of a God who will ultimately proportion happiness to virtue and vice versa. Kant's criticism was effective in weakening the force of the above-mentioned proofs in their traditional formulation. Evolutionary science has also contributed to lessen the force of the cosmological and teleological arguments in their earlier and cruder statement. If the present complex condition of the world is the result of a slow process of development from a simpler condition, the need for a First Cause of the present world is less apparent. If present organic structures owe their existence to their utility (that is, are the result of natural selection), their purposiveness is explained by natural causes. But all such criticism, including that of Kant, is effective rather against the form than the substance of theistic argument. It has led only to a reconstruction of old arguments and their statement in a more adequate and convincing manner. Thus it would seem that the arguments for the existence of God are rather stronger than weaker, as the result of criticism. They only indicate in outline what form some of these arguments have taken in recent years. (1) Belief in God is justified by the needs of human thought. The constant endeavor of the human mind, in its thought, is to introduce more perfect unity, more completeness, into its knowledge. The idea of God by virtue of its all-inclusiveness, is required as the final instrument of organization to make this unity complete; for by it the self and the world are justified, the elements of one universal life. Thus the idea of God proves its own reality by its function in knowledge. (2) The existence of God is evidenced by the nature and development of the world. In the natural world we have a series of events related as cause and effect, and each dependent upon the other. Since each component part is dependent upon and determined by some other part, it is impossible to conceive the whole series as standing alone. It is rather by its very nature dependent, and requires for its existence and support some ground or underlying principle that is self-determined. From the nature of the world as dependent and relative, therefore, we are led to believe in the existence of an Underlying Principle that is self-determined and absolute. If we consider next the development which the natural world has undergone we see its culmination in man with his intelligence and civilization. The character of the underlying principle or ground of any process will, of necessity, be more completely manifested as the process unfolds. Thus the intelligence and personality of man, as the outcome of the natural order, reveal to us the intelligence and personality of its Ground. (3) The ideals of human activity, both theoretical and practical, presuppose the existence of a God. The thought of man has an ideal, Truth, for which it ever strives. Yet Truth exists in no single human mind, neither is it the possession of the race. Truth is universalizing the force of God. If it is true it must exist somewhere. We are forced then to assume a divine mind in which Truth exists in all completeness. The same is true of the good, the ideal of human conduct. That good which, as moral ideal, exercises absolute authority over all men, is relative neither to in-

dividual desires nor to the desires of a society of individuals. Here, too, we are obliged to assume a Divine Personality whose plans are realized in the moral order and whose purposes are represented in the moral ideal.

Cornell University

THEISS, tis, or TISZA, tis'6, Hungary, the largest tributary of the Danube and one of the most important of the country, rises in the Carpathians, being formed by the junction of numerous small mountain streams. Its course is first northwest, then southwest and west until, after a circuitous course, it empties into the Danube. Its entire length is 800 miles, 300 of which are parallel to the Danube. The principal affluents are the Maros and Bodrog. The cities on its route are Tokay, Szolnok and Szegedin, which is frequently visited from a river steamer. A memorable inundation was that of 1879, when Szegedin was overwhelmed and the entire population lost everything; the loss including many lives. Tokay is at the head of navigation. A canal connects its lower course with the Danube while the Harda connects it with the Temezvar. Its basin has an area of 56,600 square miles, covering all the eastern part of Hungary and most of Transylvania.

THELLUSSON, tell'us-sôn (Fr. thél-lu-sôôn), Peter, London merchant; b. Paris, 27 June 1737; d. London, 21 July 1797. He settled in London in 1762 and opened a commission house, and later acquired a large fortune by trade with the West Indies. The singular terms of his will, dated 2 April 1796, gave occasion to the passing of an act of Parliament known as the Thellusson Act. He left to his widow and family about £100,000, and the remainder, amounting to more than £600,000, he left to trustees, to accumulate during the lives of his three sons, and the lives of their sons. On the death of the last survivor the estate was to be divided equally among his three sons and their legal descendants of his three sons then living. If there were no heir the property was to go to the extinction of the national debt. The will, being contested by the heirs at law, was finally established, by a decision of the Lords, 25 June 1805. An act of Parliament, however, was soon after passed (30th and 40th Geo. III, ch. 20), restraining the power of dividing property, for the purpose of accumulation, to 21 years after the death of the testator. Thellusson's last surviving grandson

(Leipzig 1907).

MISTOCLES, than'tis-klez, Greek

ind statesman: b. Athens, about 514

, Asia Minor, 449 B.C. He

played unusual ability and great

e ostracism of Aristides in 483 was in

his influence, and he thereupon be-

political leader in Athens. He was

on eponymous in 481, and when the

vasion of Greece by Xerxes was

he obtained command of the Athen-

which through his exertions had been

the income derived from the Lau-

er mines. He contested to fight under

an admiral in the battle off Arte-

when, through neglect of his ad-

pass of Thermopylae was forced and

hordes overrun Boeotia and ad-

on Athens, he persuaded the Athen-

convey their women and children to

safety, abandon the city to the Per-

those capable of bearing arms to take

up. The exiles, among whom was

s were recalled and the command of

fleet was entrusted to a Spartan,

. The battle of Salamis (480) re-

a signal victory for the Greeks and

icles, to whom the success was mainly

became the leader not only of Athens

ecce. One of his greatest services to

ry was the skillful manner in which,

artful parleying with the

he gained time for the rebuilding of

of Athens. From this time the glory

of, it declined. He had gained the

the Spiritualism book on the costs of

strongly and he was now accused by

reasonable negotiations with the Per-

sians. He was acquitted of this charge, though

he was ostracized in 471 by his countrymen,

who had become aware of his unscrupulous

character and his inordinate rapacity, for

on which he was accused of gratifying by unjust

means. He retired to Argos, thence fled to

Epirus, and ultimately sought protection at the

Persian court, where he gained high favor with

the reigning monarch, Artaxerxes Longimanus.

He was deeply engaged in plans for the

domination of Greece by the Persians, which he

had promised Artaxerxes to compass, when,

knowing the impossibility of fulfilling his prom-

ises, according to some accounts, he took poison;

others, however, ascribe his death to natural

causes. His career shows a curious admixture of

opulent and sagacious statesmanship and sor-

did ambition. He was possessed of great elo-

quence and was undoubtably the savior of

Athens and Greece at the crisis of Salamis.

1892); or any standard history of Greece.

THÉNARD, ta-nár, Louis Jacques, French

chemist: b. Loupptiere, Champagne, 4 May 1777;

d. Paris, 21 June 1857. He studied at different

in Paris under Fourcroy and Vauquelin, becom-

ing the assistant of the latter, who procured

him a professorship at the Collège de France

(1804). Subsequently he succeeded Fourcroy

in the chair of chemistry at the Ecole Poly-

technique, as well as in his seat in the Academy.

In 1825 he was made a baron by Charles X
and in 1832 a peer of France by Louis Phili-

ippe. It was while attempting to verify a theo-

ry he had propounded in the lecture-room

that he made his important discovery of the perox-

ide of hydrogen. He worked with the chemist

Gay-Lussac (q.v.), and made noteworthy origi-

al investigations, including those of the com-

pound ethers, of bile and of sebaceous acid. He

discovered the method of preparation of a

cheap cobalt blue, since known as 'Thénard's

blue.' His chief publications are a 'Treatise

on Elementary Chemistry' (4 vols., 1813-16)

and 'Physico-Chemical Researches' (with Gay-

Lussac, 1816).

THÉNARDITE, a mineral identical in

composition with the artificial sodium sulphate,

Na₂SO₄. It is brittle, of vitreous lustre, white

color, transparent to translucent, hardness 2 to

3, and specific gravity 2.68. It crystallizes in

the orthorhombic system, often in tabular, cross-

twinned forms, with distinct basal cleavage.

It is entirely soluble in water; natural crystals

speedily absorb water and effloresce. It often

occurs dissolved in the waters of salt lakes,

from which it is separated in crystal form dur-

ing the summer season by evaporation.

The most important American localities of this
type are Borax Lake, California, and Rhodes

Marsh, Nevada. Vast deposits exist on the Rio

Verde in Arizona. It is of value in the prepara-

tion of soda.

THEOBALD, thëô-báld, Lewis, English

dramatist and Shakespearean scholar: b. Sirt-
inborough, Kent, 2 April 1668; d. London, 18

Sept. 1744. His classical attainments were con-

siderable and by 1715 he had published transla-

tions of Plato's 'Phaedo', the 'Electra',

'Ajax' and 'Edipus Rex' of Sophocles and

the 'Plutus' and 'Clouds' of Aristophanes. He
made attempts at verse and tragedy, but succeeded in neither. In 1725 Pope published his edition of Shakespeare and in 1726 Theobald appeared with a work entitled "Shakespeare Restored," in which he restored many of his fault readings as well as Amended as Unamended by Mr. Pope in his later edition of this Poet: designed not only to correct the said Edition, but to restore the true Reading of Shakespeare in all the Edible allusons that suggest the use of the manifoldly improved readings suggested by Theobald in his second edition, he never forgave the seeming of his incompetence as an editor and in the first edition of the "Dunciad" Theobald figured as hero. In 1733-34 Theobald published an edition of Shakespeare in seven volumes, in the preparation of which he had the assistance of Concanen Thirby and Warburton. Textual criticism of Shakespeare owes much to him, for he was the first to discard conjectured readings and in his emendations displayed knowledge, tact and good sense. Subsequent editors have depended much upon him and have adopted his corrections. At the time of his death he was engaged in a new edition of Shakespeare and Fletcher, six plays of which he had already completed. Consult Collins, "Essays and Studies" (London 1895); Nichols, "Illustrations of Literature" (Vol. II, pp. 204-654).

THEOBROMA CACAO. See Cocoa.

THEOBROMINA, C.T.11-N.O, a white crystalline alkaloid found in the chocolate prepared from the seeds of the cocoa tree. It forms salts with acids, is bitter, soluble in alcohol, slightly so in water. It is closely related to caffeine, the active principle of tea and coffee. In which it can be readily changed. Caffeine may be considered as theobromine in which one hydrogen atom has been replaced by the methyl group (CH3). It is not used to any extent in medicine, although it has a slight sedative action on the nervous system.

THEOCRACY (from Gr. Theos, God, and kratos, power) is that government of which the chief is, or is believed to be, God himself, and the laws the commandments of God. The priests in such a government are the promulgators and expounders of the divine commandments, as the representatives of the invisible Ruler. The most notable theocratic government of all times was that established by Moses among the Israelites. The Puritan government of Massachusetts was also called a theocracy, owing to the claim that it was conducted on the principle of obedience to divine laws, and the requirement that all should contribute to the support of the Church and attend church services.

THEOCRITUS, the-ôk'ri-ús, Greek bucolic poet: b. Syracuse, according to others at Cos, and flourished about 280 B.C. He was a pupil of Philatus at Cos. Having gone to Egypt, he was treated with much distinction by Ptolemy Philadephus, in whose praise he wrote Idyls 14, 15 and 17, but afterward returned to Syracuse, where he appears to have been in terms of some intimacy with Hiero II. We have under his name 32 idyls, or pastoral poems, of which, however, several are probably by other authors. The most doubtful are 12, 14, 15, 27, 28. He is to be considered the author of this species of poetry as a branch of Greek literature, though the elements of it existed before his time among the Dionysians of Sicily and Greece. Most of his idyls are dramatic form and consist of the altered courses of many short scenes, as well as the fresh and vivid pictures of life, common in Sicily, and are by considerable comic and, though not extent, tragic power. They are of a different sort from the altered compositions regarding the imaginary shepherds of Arcadia. Writing generally in the idyl, in two cases (Idyls 28, 29) in didactic, which is peculiarly adapted to the simplicity of rural life, his language is still harmonious. His metre is chiefly the hexameter. Besides the idyls he wrote a called "Berenice," of which only five lines are extant, and 22 epigrams (Greek Anthology). He was imitated by (g.v.) in the "Echoes" of Dryden's "Thebes to his has been well shown by, in chapter of the "Victorian Poets" (See Theocritus, Bion and Moschus). The best editions of his works (usually joined with Bion) are those of Meineke (1855); Wordsworth (new ed. 1877); Fritzschke (3d ed. by Hille, Leipzig. There are renderings into English by Chapman (1806) and Calverley (1849) and into prose by Lang (with introduction, New York 1880). The 7th and 8th are translated in verse by Leich (Hunt's "Honey," 1848). Consult, besides the mentioned works, Christ-Schmid, "Ger. Poet. Neurömische Literatur" (Vol. II, Munich 1911); Fritzschke, "Zu Theokrit Virgil" (1860); Knapp, "Thekritis u. Didymen-Dichtung" (1882); Wright, W. Short History of Greek Literature (York, 1907).

THEOCRITUS, BION, AND CHUS, Idyls of. Theocritus is one of the names contributed by Greece to the pantheon of pastoral poets, and to those后者 always been the "glass of fashion and the mold of form"—to Bion, to Bion, and to the English, Italian, Spanish and French of the Renaissance (and there were many who were pleased to write of shepherds, their loves and their lamentations. The flowers from which all the poets of Europe have sucked their being lived in Sicily in the earlier part of the century and. An epigram, written in prose, by some one else, says: "I, who wrote these idyls, am a citizen of the people, the son of Phyllina." It is important to note that the idyls, the poems that have come down under his name are 32 idyls, not always classified as bucolics, mimes, idylls and 20 odd epigrams. The poems that form the topic of this discussion are what we call the "Idylls" of Theocritus. It is probable that a few of these idyls are what we
hers are little pictures or sketches on subjects. His first idyl is dialogue in Thrysis and a goat herd, in which sings the famous 'Lament for Daphnis.' Second tells how a passionate, jilted attempts by magic rites to regain the her deserting lover. The next declares herd's love for Amarillis. These are contests between herdsmen. Two, VI I. are about the love of the Cyclops, us, for the sea nymph Galatea; ans about Hercules and Hylas. Two are eulogies on Hiero, lord of Syracuse, Ptolemy Philadelphia, king of Egypt. r XIX is a very brief poem that tells bee stung the little god Eros; and sev- hers are probably spurious.

Haps the most famous are the 1st, d 15th. The first because of the t for Daphnis, which served as a model on's 'Dirge of Adonis,' for Milton's is, for Shelley's 'Adonais' and Mat- t and Arnold's 'Thyris.' The second, in the as Sir Charles, bestial and col- ul, tragically, strangely humorous and ut- unforgettable, and has remained a unique piece in literature. The 15th is y the most interesting to English read- is certainly the most entertaining. Mat- Arnold calls it 'one of the best and t of Theocritus's idyls.' It is really a ay, of which the two chief dramatists per- e Syracusan women, living in Alexandria. mes to get the other to go with her to her to the honor of which the queen of Egypt has ar- with unusual magnificence. The cele- is to be in the palace, where a beauti- ure of Adonis is to be exhibited and a prima donna is to sing a hymn to life and Adonis. The two women and maids make their way through the d streets, squeeze into the palace with y and hear the hymn. The scene is felike.

It is mainly this quality of lifelikeness the bucolic idyls, distinguishes Theoc- rom Virgil and all his other imitators, ed not suppose that Sicilian shepherds spoke as Thrysis and Daphnis speak, or ce the less elegant Battus and Corydon. ecritus uses language not too far from t depicts the Sicilian country, with its and rustic objects, in a realistic way; s his imitators are all artificial, and especially during the Renaissance, usily so forsaking all semblance of scenes in which their Phyllisises rydons make love or lamentation might in Marie Antoinette's drawing room; shepherds drive their flocks afield in adors near Girgenti, or over the plains ania.

Translation of Theocritus can give more rude idea of the original. Strictly g, poetry cannot be translated; and in itation of Theocritus not only is the gone, but his words are so accurately that the translation is merely a translation of the 15th idyl is that in w Arnold's essay on 'Pagan and 'Religious Sentiment,' and for the other idyls, the prose versions by Andrew Lang. Edmund Clarence Stedman translated for, the I, X, XIII and XIX, following the hexameters of the originals. Many other translators in prose and verse have tried their hands, and some with a reasonable measure of success.

Bion is an imitator of Theocritus. Little that he wrote remains: there is the 'Dirge of Adonis,' half a dozen short idyls and some fragments; he himself is a shadow. From the poem, a 'Lament for Bion,' attributed to Moschus, it appears that Bion was born in Asia Minor near Smyrna, and possibly that he traveled in Thrace and Macedonia, also that he lived in Sicily and died by poisoning, and that Theocritus mourned him. But modern criticism denies that the 'Lament' was written by Moschus, denies the story of poisoning, and puts Bion about 150 B.C. The 'Dirge of Adonis' is by far the most celebrated of his poems; for if the earliest suggestion for 'Lycidas,' 'Adonais' and 'Thyris' comes from the 'Lament for Bion,' it certainly comes by way of the 'Dirge of Adonis.' The poem is a lament by Aphrodite over the dead Adonis; in part it is passionate to frenzy, with an element of Asiatic extravagance, but in other parts florid, pretty, elegant and artificial. His other poems, for the most part, are love songs, delicate, sweet and elegant.

Moschus seems more shadowy still. His fame is united to that of Theocritus and Bion, as one of the three chief pastoral poets of Sicily; and this union in renown has been strengthened by the common practice of publishing their works together. To Moschus were usually attributed six or seven idyls, 'Eros,' 'The Runaway,' 'Europa,' the 'Lament for Bion,' 'Megara, the Wife of Hercules,' and others. The 'Lament for Bion' is the poem on which his fame has chiefly rested. It represents the poet as Bion's pupil, and is framed upon the models of the 'Lament for Daphnis' and the 'Dirge of Adonis,' it is pathetic, delicate and imaginative. But the style is too contemporary of Theocritus, and seems to prove that the poem belongs to a later age. Modern criticism, therefore, takes away its authorship from Moschus and that of the Megara as well. Moschus himself is now believed to have lived at Syracuse about 150 B.C.

The authoritative text of 'Bion and Moschus' is that by U. von Wilamowitz-Moellendorff, 'Scriptorum Classicorum Bibliotheca' (Ox- ford 1905).

No translation of any of these poems gives more than a rough and ready idea of the original. The more imaginative the poet, the more delicate his workmanship, the less the translator can imitate him. This is as true of Bion and Moschus, or whoever wrote the 'Lament for Bion,' as it is of Theocritus.

HENRY D. SEDGWICK,
Author 'Essays on Great Writers,' etc.

THEODOLE. See Surveying.

THEODORA, the-ô-dô-ra, Byzantine empress consort of Justinian I; b. 548 A.D.; d. 548. She was, according to the dubious evidence of Procopius, the daughter of Acacius, a bear-ward at Constantinople, and had already been by turns actress, dancer and harlot, when she won the heart of the austere and ambitious Justinian, to become in succession his mistress, his wife and the sharer of his throne (527). Never thereafter did the fear of scandal touch her name; she became Justinian's trusted counsellor, bore a chief share in the work of government, and saved the throne by her high courage at the crisis of the Nika riots (532). "Now every man must die once," said she in council, "and for a king death is better than dethronement and exile." If you wish, O emperor, to save your life, nothing is coming; there are your ships and the sea. But I agree with the old saying that 'empire is the best winding-sheet.' She lavished her bounty on the poor. Consult Delbrueck, Antonin, 'L'Impératrice Théodora' (Paris 1885); Diehl, Charles, 'Justinien et la civilisation byzantine au sixième siècle' (Paris 1901). Théodora, impératrice de Byzance' (3d ed. Paris 1904); Gibbon, Edward, 'Decline and Fall of the Roman Empire' (ed. by J. B. Bury, Vols. IV and V, 1912); Mallet, C. E., 'The Empress Theodora' (in English Historical Review, Vol. II, London 1886).

THEODORÉ I, théô-dô-ré, of Corsica, otherwise Baron Théodore de Nenhoff, German adventurer; b. Metz, about 1696; d. London, 11 Dec. 1756. He was the son of a Westphalian nobleman and engaged in the French, Swedish and Spanish service successively. In 1732 he went to Florence as chargé-d'affaires for Emperor Charles VI, and taking part in a Corsican uprising against Genoa through funds furnished by the Bey of Tunis, was proclaimed king of Corsica in 1736. Soon after, however, he was driven to flight, but made two subsequent attempts to reinstate himself in 1738 and in 1743. In 1749 he settled in London, where his creditors put him in prison; but his release was purchased by the support of Walpole. By his wife, an Irish lady whom he robbed and deserted, he had one son known later as Colonel Frederick, author of 'Mémoires pour servir à l'Histoire de Corse' (1768). Consult Fitzgerald, 'King Théodore of Corsica' (London 1890).

THEODORE II, or NEGUS, king of Abyssinia; b. province of Kwarra, 1818; d. Magdala, 14 April 1848. Originally named Kasa or Kasai, he led a revolt in 1854 against Ras Ali, ruler of Abyssinia, whom he defeated. Later he was crowned, under the title of Théodorus, king of kings, of Ethiopia. He was a man of strong personality, an enemy of Islamism, a ruler and a reformer. He became intolerant of any power other than his own and with the queen-mother of Nubia took offense at what he considered slight. His quartel with Great Britain was brought on by the judicial conduct of the English consul, Captain Cameron, sent to him in 1841 and by the failure of the English government to respond to his overtures regarding the reception of his Ambassador at the English court. He finally imprisoned Cameron and also Hormuz Rassam, a Turk. English subject, sent to treat with concerning Cameron's release. As setting the prisoners at liberty Théodoroquested that certain skilled artisans be him, together with presents that he led to expect. The English detained artisans and presented at Magdala the release of the prisoners; but as they delivered up, war was declared, and a petition under Sir Robert Napier's progress toward Magdala in the latter 1867. The city was reached, and active hostilities began on 10 April 1868. On the 11th city was taken and Théodoro was fc. The besiegers were informed that he had committed suicide. See Abyssinia and British and Theodora, ecclesiastical writer; b. Antioch, about 428. He studied rhetoric under Libanius in Rome and Andragathius and sacred ture under Flavianus of Antioch, Dioscorus and others. Early in life he fell of his fellow-student and chief mate, John Chryssostom, whom he admired, although he had been on the point of ing a lady of Antioch named Hermione, being ordained priest he distinguished himself as an opponent of Arians. From Antioch he removed to Tarsus, a city of about 392 was chosen bishop of Mopsuestia. In 394 he preached before the Emperor at Constantinople and was present the council held in that city at that time was a voluminous writer, the most imp works being commentaries on and polemical treatises. These were In great repute among the Syrian churches many of them were translated into Arabic and Persian. His views appro in the Eastern Church, he was condemned as a heretic at the Ecumenical Council, held at Constan 553. For fragments of Théodora's works, Migne, 'Patrologia Latina'; J. M. Consul and also Harnack, A., 'History of Christianity' (Vols. III, IV; Boston 1898); Kühn, 'Dero w von Mopsuestia' (Freiburg im Breisgau); and Piercy (eds.), 'Smith's Dict. Christian Biography' (Boston 1913). W. Symes, 'Syria Literature' (London 1894).

THEODORÉ, théô-dô-ré (Đowq), church historian and thebian writer; b. Antioch, late in the 4th century. He was educated in a monastery Antioch, where he had Nectarius and of Antioch for fellow-pupils. After study and retirement he succeeded (423) as bishop of Cyrus, a city at days' journey from Antioch. He endeavored to play the part of mediator between and Cyril of Alexandria, but could not reconcile the two. He was by the Council of Ephesus, an act which of his consecration against, but excused. When the Nectarians were with relentless severity, he stood for their champion. He was the successor of Dioscorus. The latter accused Nectarianism, pronounced a anathema upon him in the church of
andria and (449) procured his deposition at the th-called robber council of Ephesus, a sentence which was reversed by the general council of Chalcedon (451). The most important of his works, of which a complete edition was published by Schulze and Nösselt (1769-74), consist of commentaries on the Old Testament and his 'History of the Church.' In five books, beginning with the history of Arianism under Constantine the Great and ending with the death of Theodore of Mopsuestia; 'Religious History,' a narrative of the lives of the hermits, called the Fathers of the Desert; 'Eranistes,' three dialogues against the Eutychians, and 'History of Heresies.' Consult Binder 'Etudes sur Théodoret' (Geneva 1844); Gaisford, 'Theodoreti Historia Ecclesiastica' (1854); Harnack, A., 'History of Dogma' (Vol. IV, Boston 1896); 'The Nicene Fathers' (ed. by Schaff and Wace, Vol. III, New York 1892).

THEODORIC I, theód’o-rík, king of the Visigoths. He was chosen successor to Valamara (456) and extended his kingdom, especially so as to embrace the neighboring Roman cities of Arles and Narbonne. For this purpose he made war against the Romans after the death of Honorius in 423 and continued with varying results until 437, when he entered into an alliance whose exact terms are unknown. By 450 he came into closer alliance with the Romans in the endeavor to check the advance of Attila, who led his barbarian army across Lorraine and captured the city of Orléans. Theodoric and Aëtius, the Roman general, encountered Attila near the village of Moirey, a few miles from Troyes, and fought the battle generally known in history as that of Châlons-sur-Marne, in 451. Theodoric was killed by an arrow; but the progress of Attila was checked and western Europe was saved from the domination of barbarism.

THEODORIC II, son of Theodoric I. He was a member of the party who wished to remain on terms of peace with Rome and was chosen successor of his father. Tho- reo2ed Theodoric I, began to levy war against the Romans he took part in a rebellion that ended in the murder of Thorsmund and his own elevation to the throne. As vassal of the Roman emperor Aëtius he made an expedition against the Sueves, conquered and put to death their king and was in a fair way of completing the conquest of Spain, when Aëtius was deposed and killed and Theodoric ceased his efforts. In 466 he was murdered by his younger brother, Euric.

THEODORIC THE GREAT, king of the Ostrogoths: b. about 454; d. 526. His father, Theodemir, was one of the three brothers who jointly ruled the Ostrogoths settled in Pannonia, and he sent him, when only eight years of age, to Constantinople as a hostage, to secure the conditions of a treaty between the Goths and the Emperor Leo. After residing 10 years with that emperor he was restored to his father, then sole monarch of the Ostrogoths. On the death of Theodemir, and being indignities set on him, he began a course which, after menacing the safety of the Greek empire, and Constantinople itself, terminated in an expedition against Odoacer, who had assumed the title of king of Italy. After several bloody engagements, the latter was finally induced to yield, on condition that he and Theodoric should govern Italy with equal authority (493). The murder of Odoacer at a banquet soon followed this agreement; on which Theodoric caused himself to be proclaimed king of Italy, and he governed with extraordinary vigor and ability. He attached his soldiers by assigning them a third part of the lands of Italy, on the tenure of military service; among his Italian subjects he encouraged industry and the arts of peace. He improved the administration of justice, issued edicts to protect the public monuments at Rome and elsewhere, and assigned revenues for the repair of the public edifices. Like his ancestors he was an Aribean, but was indifferent to controversy and never violated the peace or privileges of the Roman Catholic Church. The particulars of the government of this memorable prince, who shed a short-lived lustre on the Gothic name, are recorded in 12 books by his secretary, the senator Cassiodorus, a learned, who induced his illustrious master to become a patron of letters. The senators Boethius and Symmachus were both put to death on the mere suspicion of an intrigue between a senatorial party and the imperial court. This cruel act had no sooner been perpetrated than Theodoric was seized with remorse, and a fever ensued, which terminated his life in three days. The ordinary residence of this king was at Ravenna, above which city his daughter Amalasuntha erected a splendid monument to his memory. Consult Dahn, Felix, 'Die Könige der Germanen' (Vol. III, Würzburg 1886); Gibbon, Edward, 'Decline and Fall of the Roman Empire' (Vol. IV, ed. by J. B. Bury, London 1912); Hodgkin, Thomas, 'Ostrogothic Invasion' (in 'Italy and Her Invaders,' Vol. III, London 1885); id., 'Theodoric the Goth' (New York 1893).

THEODOSIA. See PEDEOSIA.

THEODOSIUS (thód’é-dó’shi-ús) THE ELDER, Roman general: d. Carthage, 376. He was the father of the empress Eudocia (q.v.), called "The Great." By birth a Spaniard, he rose to high rank in the Roman army and in 367 was sent by Valentinian I to Britain, where he repelled the invasions of the Picts and Scots, strengthened the military defenses and restored order. He formed the country between Hadrian's wall and the Forth and Clyde into a new province, which he named Valenti, and then returned to Rome. He was later stationed on the Upper Danube, where he was victorious over the Alemanni, and in 376 quelled the revolt in Africa led by the formidable Moorish chieftenant Firmus. He was beheaded at Carthage in 376 by order of Valens, on some unknown and probably unjust charge.

THEODOSIUS (surnamed THE GREAT), Roman emperor: b. Spain, 347; d. Milan, 17 Jan., 395. At a very early age he obtained a separate command; but on the execution of his father he sought retirement, until selected by the Emperor Gratian, in 379, for his partner in the empire. To his care were submitted Thrace and the East, and he was delivered from an invasion of the Goths, whom he signally defeated in two battles, concluding a peace with them in 382. On the defeat and
death of Maximus at Aquileia (388) he became the sole head of the empire, Gratian having been previously killed in the war against Maximus. He administered the affairs of the West in the name of Valentinian, the son of Gratian, then a minor. He entered Rome in triumph in 391, and passed three years in Italy. In 396 a sedition took place in Thessalonica, which resulted in the murder of the governor and several of his officers. The resentment of Theodosius was natural and merited; but the manner in which he avenged it was in the highest degree detestable and inhuman. An invitation was given in the emperor's name to the people of Thessalonica to an exhibition at the circus, and when a great concourse of spectators had assembled they were massacred by a body of barbarian soldiery to the number, according to the lowest computation, of 7,000. Theodosius was at this time at Milan, of which Saint Ambrose was bishop, and this prelate, on account of such an atrocious proceeding, resolutely refused to recognize it for eight months. About this time the emperor crowned his merits, as a foe to paganism, by demolishing the celebrated temple of Serapis and all the other heathen temples of Egypt, and he issued a final edict prohibiting the ancient worship altogether. On the murder of Valentinian by Arboagastes and the advancement of Eugenius in his place (392), the emperor carried on a war against the latter, which finally terminated in his defeat and death. Theodosius did not long survive this success.

Consult Gibbon, 'Decline and Fall of the Roman Empire' (London 1912); Hodgkin, T., 'Italy and her Invaders' (Oxford 1892).

THEODOSIUS II, Roman emperor, son of Arcadius and grandson of Theodosius I; b. 401; d. 450. He became emperor in 408, but proved a weak ruler, and the actual government was in the hands of his sister and of his wife during the greater part of his reign, in which the Theodosian code of laws was compiled. He was killed by a fall from his horse and was succeeded by his stepson, Pulcheria.

THEODOSIUS III, emperor of Constantiople. He held the unimportant post of collector of the revenue when he was nominated to succeed Anastasius, and he was crowned in 716. He resigned in favor of Leo the Isaurian in 717 and retired to a monastery. Consult Gibbon, E., 'Decline and Fall of the Roman Empire' and 'Cambridge Mediaeval History' (Vol. I, New York 1911).

THEOGONIS (thé-'og-nís) OF MEGARA, Greek elegiac poet. He lived between 540 and 500 B.C. There are 1,880 verses preserved under his name, of importance in enabling us to understand the state of parties and the problems of society in the Greece of that time. They were translated by Frere (1842) and are found in the original in Bergk's 'Poetae Lyrici Graeci' (1813).

THEOGONY, a poem treating of the generation and descent of the gods. The most ancient Greek theogony known to us is that of Hesiod, the earlier Theogonies of Musaeus and Orpheus having perished.

THEOLOGICAL EDUCATION. See EDUCATION, THEOLOGICAL.
ality of the Christian religion. Anyone, re, who regards himself as scientifically id to accept these tenets, on the score of preponderance of evidence in their be ill of necessity be convinced that he ful demands of a scientific theology in tak or more than one faith to one. Such that Aristotle was often cited under the simple designation of the philosopher. In the modern period the Cartesian philosophy, the Leibniz-Wolffian, the Lockian, the Kantian, the Hegelian and others have unmistakably claimed spheres of influence in the theological domain. It appears, therefore, that a discreet choice of philosophical affiliations is the best that theology can do. It may enter into too close an alliance with a specific philosophy. It may fail to observe the due balance between a speculative bent and a sane regard for historical data. But it will and must draw largely from the resources of philosophy if it is to be fundamental and comprehensive.

A further question on the scope of theology concerns the relation of this branch to the domain of natural science. That a relation obtains to which a measure of significance may be attached is undeniable. It is not to be overlooked, however, that the field of natural science comes into less extensive contact with theology than does the field of philosophy. In so far as science moves in a physical or sub-human range, it touches upon matters that are of only subordinate theological import. It may enforce a revision of the theory of creation which has been read into or elicited from the biblical narrative; but of how small theological consequence is a conclusion on the precise method of creation, so long as God in his absolute supremacy and man in his dignity and worth are left to the contemplation! It may enlarge the view of the operation of secondary causes in the production of organic forms, and so may require some modification of the putting of the argument from design; but that involves no challenge to any theological tenet or interest, since the vast range of orderly results in nature must still be seen, as many of the most eminent naturalists confess, to demand ultimately an ordering intelligence. In short a close scientific examination of the subject will reveal that the findings of the physical sciences can neither displace the foundations of the central tenets of theology nor supply foundations to these tenets. Their function is exhausted in modifying one and another peripheral matter or adjunct of the theological system. Probably the greatest result which has come from that quarter is an offspring of the doctrine of evolution and consists in an enlarged tendency of the theological mind to expect, in relation to the kingdom of God in the world, tokens of the law of consecration and graduated progress. Undoubtedly the theologian does well to take note of the approved findings of natural science; but large expectations of contributing from that quarter to the task of ex tent to be fulfilled. It is in the constitution and experiences of man, and in the philosophical interpretation of both the world of nature and of personality, that theology must find its principal basis. Among the human experiences that make up the substance of sacred history may of course claim a distinct primacy. In other words, the Bible may be rated as the foremost treasury of theological data.
THEOLOGY

Scientific Value and Rank.—One and another system of theology, as actually developed, may be remote from a scientific character. But intrinsically scientific construction is just as feasible and appropriate in the field of theology as in any other field. Where a contrary impression has been obtained it has generally been due to one of three causes. Either the aogistic axiwm that religion has the unknown for its proper field has been adopted, and in consequence theology, as the theoretical side of religion, has been put up as a peer of substantial foundation; or theology has been associated with arbitrary authority; or a strained antithesis between reason and faith has been contemplated.

As respects the maxim which embodies the first of these grounds of objection, it must be pronounced a gratuitous negation of religion. It is a negation of religion, for sheer mystery offers no means of attachment. In the words of Pfeiderer, a religion of nothing but mystery is an absurdity. The maxim is also perfectly gratuitous. As John Fiske has said: None can deny that religion is the largest and most ubiquitous fact connected with the existence of mankind upon earth. It is so vast a department of human experience as to be regarded as by no competent ty supply any valid grounds of induction. Are the concurrence of thoughts, aspirations and satisfactions of the elect spirits of the race to be rated as void of all rational suggestions? Is not the sure basis of conviction to be found in the illuminated and transcendent consciousness of the Christ? Such questions need no formal reply. Theology doubtless has a great border-land of mystery. And so has biology. Indeed it is characteristic of most of the sciences that they impinge upon mystery. Alongside a domain of certainty they include areas which can claim at best only a high degree of probability. On the score of mystery, therefore, no good reason is apparent for expelling theology from scientific fellowship.

The second ground of objection of the scientific character of theology is sufficiently met by the affirmation that arbitrary authority is an interloper in the theological domain. If it has ever intruded itself here, it has been in the exercise of rank usurpation. Theology in its true character has no partnership with arbitrary authority. While it may make large account of positive revelation, it does not turn that revelation into a fence against investigation but uses its content for what it proves itself to be under the tests of mental scrutiny and prolonged application to the exigences of man's deeper life.

To the third objection a reply of similar tenor is to be made. The assumption of an antagonism between reason and faith, and of an obligation to sacrifice the former to the latter, is an assumption which a sane theology must emphatically repudiate. It is very true, doubtless, that a conflict of thought or any more than theory can take the place of action. But it is equally true that faith cannot endure to be in known antagonism to reason. An asse } which, from the standpoint of one denomination, is to be sanctioned by reason, is no real assent. Only that which is competent to take captive man's rational personality is able to induce a faith that is anything more than a sham or a shadow. Quite as much as any other branch of learning theology is free to emphasize the rationality in faith. The challenge of the scientific character is thus seen to fail as each of the cardinal objections mentioned.

In an unbiased valuation of theology, an association will not be made between substance and form. It is not incompatible with a variety of forms, in no wise rejection against a poetic garb. It is the picturesque discourse of the scholastic form, they are deeply, theology finding all their backgrounds of the most pronounced conceptions of God as well as the most beautiful that was ever before the contemplation of man. All religious discourse which is to avoid the charge of mannerism and impotency must in line with a substantial theological content. As Brooks has said, No exhortation to a god that does not put behind it some truth as to eternity, can seize and hold the conscience. Even in its formal character theology must be rated as second in interest to no degree of thought and study. The facts and with which it more directly deals are the est in man's being and the highest about human plane. It utilizes and gives a significant findings of a large proportion of the of learning. It takes into consideration the greatest treasures of past history, and it up the data for the fairest possible into future destiny. It gives ample for speculative accept, but at the same ti includes the themes that are of all the more tensely practical.

The Organic Arrangement of Matter.—The best arrangement of the divisions and branches of theology is one the one which is characterized by simp well as by comprehensiveness and self- eney. The very subtle scheme is likely to its inventor in a much higher degree the theological world at large. Among plans which meet in good measure combined demands of simplicity and comprehensiveness those of Henrici and H. are worthy of special mention. The draws a distinction between historic and normative branches, the one include the specifically biblical branches as the history of Christianity since b times, and the other comprising, as p subdivisions, Systematic Theology and Practical Theology. The idea of the last branches is to exhibit the whole do religious truth and fact; the idea of theative branches is to afford means of guide religious teaching and work. That there certain fitness in the distinction between two lines of study is undeniable. Still tinction is not beyond criticism. ( accredits a high degree of authority, libel may well be reluctant to each designation of an or of a branch in other biblical branch. Especially may _ tate to exclude that designation in Domatin. In view of this I to Henrici's nomenclature of Haugwirth — which is not of the logical domain between Exegetical, Hist- tematic and Practical Theology — Iarded as having at least an equal a pretension. Aside from its intrinsic motive for giving this plan the praven}
Systematic Theology, which has, in its Christian character, the office of furnishing an orderly presentation and justification of the whole body of teachings or beliefs which belong to the Christian religion, includes three principal branches, namely, Apologetics, Christian Dogmatics and Christian Ethics. It may also include Biblical Dogmatics, Polemics and Trensic, though the subject matter covered by these titles can conveniently be appropriated within other branches. An auxiliary to Systematic Theology of special significance is found in the Philosophy of Religion. Of the several branches named, Christian Dogmatics is so far central and prominent as often to be styled Systematic Theology. Being free to gather its evidence from every field, and aiming to present in organic form the whole doctrinal content of the true religion, it commands in the field of theology the maximum intellectual interest.

In Practical Theology the leading branches are Liturgics, Homiletics and Pastoral Theology. The last named is of wide compass, including besides the general theme of pastoral care such subsidiary branches as Catechetics, Ecclesiastical Polity, Ecclesiastical Discipline, and Theory of Missionary Work. Recently the interest in sociological study has created a motive to subjoin a branch which might be entitled Christian Sociology.

Prominent Stages and Representatives.—In the broad view three great epochs in the progress of theology are distinguishable, namely, the Greek, the Latin and the Modern. The last might also be called with relative propriety the Protestant, since the motive-power for its developments has been supplied in large part from within the domain which bears that title. The development of the Latin type was in part contemporary with the shaping and manifestation of the Greek type; still the former appears clearly second in order, since its initial stages were synchronous with the culminating stages of the latter. Greek theology had run its course and come essentially to a standstill before the more characteristic systems of Latin theology were elaborated by the medival scholastics. The two undoubtedly had very much in common. The same great creeds were acknowledged in the Latin church that had been obtained in the Greek division of Christendom, and the dogmatic grounds which were alleged ultimately for the severance of fellowship were of subordinate import. Still Greek theology stood in measurable contrast with Latin. It took on the whole a more general view of the divine relation to the non-Christian world. It was less inclined to a sombre conception of man’s native guilt and moral impotency. It accentuated to a special degree the thought of a divine incarnation and of the intimate connection between God and man provided for by means of the incarnation. The same thought was by no means foreign to Latin theology, but in its domain it was given, relatively speaking, less prominence, since it was made to share the field with the greatly emphasized conception of divine rulership. The standpoint of the one affiliated with a mystical theory of an interior life; the standpoint of the other was more legal and governmental. Both admitted the ideas of priestly mediation and efficacious, at least after the initial stage; but it
accorded with the genius of Latin theology to work out the most consummate expression of these ideas in a thoroughly elaborated hierarchical and sacramental system. In the one authority came to be regarded as specially residing in the creed and formulas of the past, in the other great prominence came to be assigned to the hierarchy, and especially to its head, as the perpetual embodiment of infallible authority. While this line of contrasts may legitimately be affirmed, it is to be understood that one and another point of difference cannot be taken too strictly, since in neither the Latin nor the Greek domain was theological thinking entirely uniform or homogeneous.

The Protestant era was initiated in a revision of the principle of authority which had been transmitted in Latin Christianity; and a fundamental feature of the theological activity of that era has consisted in carrying out this revision to its logical results. Original Protestantism, accepted in common with the Latin communio the great outlines of doctrine contained in the ancient creeds, especially the Nicene and the Chalcedonian. But it accepted them upon a revised basis. What was that basis? In the last analysis it must be defined as the principle of free rational induction, in opposition to the principle of judicial determination by official authority. The primary appeal was indeed to the scriptural content and to the doctrine of justification by faith. But since no infallible tribunal was set over the Scriptures, the appeal thereto amounted practically to a transference of the main emphasis to the free rational process. As respects the doctrine of justification by faith, it looked evidently in the same direction, since it profoundly qualified the necessity of priestly mediation or of dependence upon the hierarchy. The assertion of this revised conception of authority, it is needless to say, was not designed to imply any challenge to the idea of supernatural revelation. Logically, too, the Protestant principle involves no necessity to challenge that idea. What it shuts out is official monopoly of revelation and authoritative determination of its import by official prerogative. In place of this it installs, as the proper ground of theological convictions, free rational induction over the Scriptures which, if properly carried out, must take full account of the data of history, reason and experience. The advocates of the Protestant principle admit the great difficulty of the task of ideal theological construction on the basis of that principle; but it is their conviction that exemption from the labor of a thorough-going induction ought not to be sought in the religious sphere any more than in other spheres. The seeking of relief in the attachment to some perpetual office in the Church they regard as quite useless and mistaken, since it is less difficult to accredit, on the basis of history, reason and experience, any worthy element of belief, than it is to prove the continuous existence of an infallible tribunal.

In a closer review of the progress of theology it would be necessary to notice a number of significant developments in each of the great epochs mentioned. Account would need to be taken of the, e.g., Alexandrian, the Cappadocian, the later Alexandrian and the Antiochian schools in the Greek Church. In relation to the Latin Church attention would need to be given to the long history of the antithesis between Augustinian and anti-Augustian tendencies; to the struggle between Jansenism and Jesuitism; to the conflict, between papalism and antipapism. Within the Protestant domain there would be occasion to consider the early creative period of the Lutheran theology; the scholastic period in the 17th century; the Pietistic and Rationalistic movements in Germany; the implication of Lutheranism with successive philosophies since the dawn of the 18th century; the controversies between Calvinism and Arminianism; the contrasts between High Church, Low Church and Broad Church parties in the American Establishment; the wide-reaching tendencies born of the Wesleyan revival; the initiation in Germany of the great movement of biblical criticism and its extension to other countries; and the rise and influence of the Ritschlian theology.

Among theological writers eminent for their representative position, or breadth of influence, or both, we may specify, in the Greek Church, Origen, Athanasius, Basil, Gregory of Nazianzen, Gregory of Nyssa, Cyril of Alexandria, Theodoret and John of Damascene; in the Latin or Roman Church Augustine, Anselm, Peter Lombard, Alexander Hale, Albertus Magnus, Thomas Aquinas, Bonaventura, Duns Scotus, Suarez, Bellarmine, Petaius and Pezron in the Lutheran Church, Luther, Melanchthon, Chemnitz, Gerhard and Schleiermacher; in the Reformed Church on the Continent, Zwengli, Calvin, Bullinger, Turretin, and Arminius; in England and her dependencies, Hooker, Chillingworth, Pearson, Bull, Baxter, Owen, Howe, Butler, Wesley and Edwards.

nt that the modern movement
 was to stem the tide of mate-rialism and agnosticism, which
then threatened to engulf the
ought of the age, and to stimu-
te transcendental research. Doubtless the
' chief and most authoritative
ement of the ends which the modern
osophical movement
were intended to accomplish is to be found in
the following letter written by one of those
adepts to one of his Western pupils:

4You can do immense good by helping to
give the Western nations a secure basis upon
which to reconstruct their crumbling faith. And what they need is the evidence that Asiatic psychology alone supplies. Give this and you will confer happiness of mind on thousands. . . . They have been charged with this current impulse which must soon come, and which will push the age toward extreme atheism, or drag it back to extreme sacerdotalism, if it is not led to the primitive soul-satisfaction of the Aryans... You and your colleagues may help to furnish the materials for a needed universal religious philosophy; one impregnable to scientific assault, because itself the finality of absolute science; and a religion that is indeed worthy of the name since it includes the relations of man physical to man psychical, and of the two to all that is above and below them. . . . Its (the society's) chief aim is to extirpate current superstitions and skepticism, and from long-sealed ancient fountains to draw the proof that man may shape his own future destiny, and know for a certainty that he can live hereafter. Since then a considerable literature has sprung up within the society, which, it is believed, has had the consent and active support of the closing decades of the 19th century and made possible the almost popular interest in the unseen world. Among the leaders of theosophical thought after the death of Madame Blavatsky, were Mrs Annie Besant, C. W. Leadbeater, A. P. Sinnett and G. R. Mead. — Mrs. Besant being Madame Blavatsky's successor in the esoteric as well as in the exoteric work of the society. Through the writings of these theosophists the so-called theosophical theories, which for centuries have seemed vague and speculative, besides being greatly amplified, have been presented in a form more definite than at any other time in the history of such thought, the teachings now no longer resting upon tradition and intuition, if indeed they ever did wholly so, but largely upon investigations made into the supra-physical realms of nature by highly developed men whose trained powers enable them to receive hallucinatory or what are called Adept's or Masters of, not solely of any one nation, but of any of the advanced nations— who have gained these divine powers in their fullness; that they exist now as in the past; that the Earth is the world of man, so far as the laws and conditions of our own solar system extend, and that their high state of progress enables them to advancement beyond human evolution, but that they of their own will can bring about changes of humanity in physical manifestation, that they may aid in its evolution; that it is from the brotherhood of these great adepts that from time to time have come into the outer world the great world teachers and that in their keeping has been the Wisdom-tradition, which in every age they have carried: the basic form; that there have always been pupils of these men, and that theosophical teaching is published to the world to-day at their instigation and through a few of their pupils; that the existence of a very subtle order of nature far finer than the ether which transmits light, upon which is impressed photographically, so to speak, in the form of living pictures, every scene or happening, however great or small, which has ever occurred from the very beginning of things and throughout the extent of the universe; that to this subtle material has been given the name of the Akashic Records, or the Memory of Nature; that not only does the trained observer who has acquired the power of sensing these conditions of the subtle medium of the universe, or of responding sympathetically to its vibrations, see vividly the particular occurrence to which he turns his attention, but he hears and feels, etc., just as he did the actors in any play; that they may be under review, perceiving their thoughts and feelings as well as seeing and hearing the outward conditions of the scene; that thus he can accurately, in proportion to his powers of observation, perceive any occurrence of the past, no matter when it may have happened, and in this way can know the true events of history; that he may also direct his vision to any period in the life of a planet and trace out its various evolutionary processes, and that he may thus enter a limitless field of observation wherein he may learn at first hand of the obscurer laws of nature; (c) that by the exercise of their highly evolved powers the Adepts or Masters of Wisdom can make definite experimental research into the Akashic Records in quite a real sense as the physicist makes his investigations within the physical world, and that they are, with these and other powers possessed by them, enabled to ascertain and teach certain general principles as definite and exact, all of which are now and have ever been known to them, and very many of said facts have to a more or less extent, been proven by the investigations of those of their pupils who have fitted themselves to do such work. In 'The Secret Doctrine' Madame Blavatsky mentions three such principles as being the fundamentals of theosophy; they are:

1. An Omnipresent, Eternal, Boundless and Immutable Principle, on which all speculation is impossible, since it transcends the power of human conception and can only be dwarfed by any human expression or similitude. It is beyond the range and reach of thought—unthinkable and unspeakable.

2. The Eternity of the Universe in toto as a boundless plane; periodically the playground of numberless universes incessantly manifesting and disappearing called the manifesting stars, and belonging to Eternity in toto.

3. The fundamental identity of all souls with the Universal Over-Soul, the latter being itself an aspect of the Unknown Root; and the obligating paterime for every soul—a spark of the former through the cycle of incarnation or necessity, in accordance with the cyclic and Karmic law, during the whole term.
io genesis.—According to the theosophist manifestation has its origin in the Ab-f of mankind, a concept that warns of the limits of human knowledge. As Mrs. Besant points out, his Ancient Wisdom, *Coming forth in the depth of the One Existence, from beyond all thought and all speech, a sphere embracing the nature of His own Being, the Manifested God, and tracing the sphere of His activity, thus outlines of His Universe. Within that sphere is born, is evolved and dies; it moves, it has its being in Him; its His emanation, its forces and energies of His life; He is immanent in all, pervading, all-sustaining, all-; He is its source and its end, its object, its centre and circumference, as the sages of the Ancient Wisdom teachings, the beginning of the manifestated Force out of all Being, the second, manifesting the two as life and form, the primordial duality, made possible of nature, between which the universe is to be woken—Life-Form, the, Positive-Negative, Active-Receiver, Mother of the worlds. Then the Logos, the Universal Mind, in which typically exists, the source of beings, the life of the Logoi, the treasure, which are stored up all the archetypal are to be brought forth and elaborated of matter during the evolution, universe. These are the fruits of the Logoi, brought over as seeds for the From the Third Logos comes forth Great Logoi, sometimes called the sirs before the throne of God; and as outbreathing! pours itself ever further and downward, from each of that we on the next plane Seven Logoi also, making up on that plane 49. Omit detail of intermediate hierarchies, it that to each of these 49 Logoi belong of the system: the vegetable, the animal, and the human. On the downward arc of its mighty curve this monadic essence simply aggregates round itself the different kinds of matter of the various planes, so that all may be accustomed and adapted to act as its vehicles; but when it has, lowest point of its evolution or immersing in matter and turns to begin the grand upward sweep of evolution toward divinity, its object is to develop consciousness in each of these grades of matter in turn, beginning with the lowest. When in the highest animal life this monadic essence or evolving soul mass reaches the ultimate limit of evolution in that type of forms, it is met by a third outpouring of Logic energy, that of the third Logos of the system, called the First Logos, resulting by this union in the formation of the numberless human Egos—the individualization of the One Self in man. It is the presence within man of this third outpouring of the Divine Life, this spark of the One Self, that guarantees to us immortality, which, from this point on, the Ego, all matter, so that when electrified by the atoms of the various planes develop all sorts of previously latent attractions and repulsions, and enter into combinations, he Ancient Wisdom, *Coming forth in the depth of the One Existence, from beyond all thought and all speech, a sphere embracing the nature of His own Being, the Manifested God, and tracing the sphere of His activity, thus outlines of His Universe. Within that sphere is born, is evolved and dies; it moves, it has its being in Him; its His emanation, its forces and energies of His life; He is immanent in all, pervading, all-sustaining, all-; He is its source and its end, its object, its centre and circumference, as the sages of the Ancient Wisdom, the beginning of the manifestated Force out of all Being, the second, manifesting the two as life and form, the primordial duality, made possible of nature, between which the universe is to be woken—Life-Form, the, Positive-Negative, Active-Receiver, Mother of the worlds. Then the Logos, the Universal Mind, in which typically exists, the source of beings, the life of the Logoi, the treasure, which are stored up all the archetypal are to be brought forth and elaborated of matter during the evolution, universe. These are the fruits of the Logoi, brought over as seeds for the From the Third Logos comes forth Great Logoi, sometimes called the sirs before the throne of God; and as outbreathing! pours itself ever further and downward, from each of that we on the next plane Seven Logoi also, making up on that plane 49. Omit detail of intermediate hierarchies, it that to each of these 49 Logoi belong of the system: the vegetable, the animal, and the human. On the downward arc of its mighty curve this monadic essence simply aggregates round itself the different kinds of matter of the various planes, so that all may be accustomed and adapted to act as its vehicles; but when it has, lowest point of its evolution or immersing in matter and turns to begin the grand upward sweep of evolution toward divinity, its object is to develop consciousness in each of these grades of matter in turn, beginning with the lowest. When in the highest animal life this monadic essence or evolving soul mass reaches the ultimate limit of evolution in that type of forms, it is met by a third outpouring of Logic energy, that of the third Logos of the system, called the First Logos, resulting by this union in the formation of the numberless human Egos—the individualization of the One Self in man. It is the presence within man of this third outpouring of the Divine Life, this spark of the One Self, that guarantees to us immortality, which, from this point on, the Ego,
or real man, wins through innumerable incarnations in physical bodies.

As the worlds are septenary in their constitution, so also is man. He has on the physical plane (1) a physical body, the dense or visible portion of which is composed of solids, liquids and gases, and the etheric portion of which is formed of the four subdivisions of ether. Pervading these is (2) vitality, derived from the sun and specialized by the etheric part. On the astral plane he has (3) an astral or desire body. And on the lower four levels of the mental plane he has (4) a mind body. These four principles constitute the personality, or what is often called the lower quaternary. On the three upper levels of the mental plane he has (5) a causal or higher mental body, the storehouse of all his experiences, past, present and future; on the Buddhist plane, (6) a buddhic or bliss body, wherein the inherent unity of all life is directly perceived, not as an intellectual concept, but as a sublime experience, and on the nirvanic plane he has (7) the cosmic or Atman body, the body of absolute reality. These last three constitute the Reincarnating Ego, the individuality, the soul which lives and grows throughout the period of solar manifestation. The other two planes may be termed the planes of the Self, or pure spirit.

The matter of the various planes of nature entering into the composition of man's sundry bodies is vivified with the involving life of the monadic essence, the law of whose progress is to sink deeper and deeper into matter, while the law of the evolution of the Self using these bodies as vehicles of his consciousness is upward and out of matter. This apparent opposition of forces in man gives rise to the usual ideas concerning his lower and higher natures, and explains the meaning of evil. One's desires, thoughts and emotions are not himself, but the changing phantasmagoria of the living essence of his lesser vehicles which it is his business to learn to control and purify, until they become perfect instruments for the action of the real man within is none other than the changeless, eternal Self.

When the human Egos began their long pilgrimage of incarnations they at first took bodies on planets other than the one on which we now live. There are in our solar system seven planetary schemes of evolution, each the realm of a planetary Logos, and they are called, in the order of their distance from the sun, (1) the Neptune scheme, (2) the Uranus scheme, (3) the Saturn scheme, (4) the Jupiter scheme, (5) the Earth scheme, (6) the Venus scheme and (7) the Vulcan scheme. Each scheme consists of a chain of seven planets and each proceeds on independent lines, there being no intermingling of their activities during their normal course. The first and fifth of this series have each three physical planets, the others one each. The two physical planets of the first scheme besides Neptune are as yet unseen by the telescope. The two of the fifth, in addition to our earth, are Mars and Mercury. The non-physical planets in the schemes are of the matter of the astral and mental planes. Each scheme of evolution is worked out by means of seven Manvantaras or periods of manifestation, each manvantara consisting of seven Rounds, each Round of seven World Periods (following each other on seven planets in succession) and each world period consisting of seven Root Race Periods. Any one of the last covering periods of millions of years. The present humanity on this planet has passed four times around the planets of its chain, and through a fraction over four root race periods. The last planet occupied by us during the present period is the seventh, the present Atlantean, and for the next the Lemurian. The two root races next before the present fifth root race of this planet were the Atlantean and the Lemurian races. The fifth root race has thus for developed as far as fifth subrace and it stated that the beginning of a new subrace, the sixth, may be for to-day in America.

Reincarnation and Karma.—Omitting mention of the interesting career of the reincarnating ego through the primigenius conceptions of the first three rounds of our own planetary chain and even of the first four rounds of this present fourth round, it will suffice to show that among the undeveloped subraces the present fifth root race reincarnation is an experience new for them. The body that once dwelt in the body; that after each death there is a period of more or less duration on the astral plane or followed quickly by another physical incarnation. Later on, as the life experiences grow greater and the reincarnating soul, by his gradual progress, has developed some of the natures of the invisible world, it becomes devachanic, that is to say, a heaven world. Here his experiences are usually long and the contact with the ego in its devachanic state is long and permanent. The ego, when his stay in the invisible world is prolonged or its experiences are usually lasting, for the average man of substantial attainments who has lived a good age, about 15 centuries. Upon the ending of this devachanic life there remains only the reincarnating ego, the lower body constituting the personality having integrated on its respective planes; but principles or qualities animating them having meanwhile left their impress upon the ego. These principles or qualities are called Karma, the ethical law which governs the course of our lives, physical or supernatural, called Karma, and it is ineradicably operative in Reincarnation. It may be defined as the action and result. By virtue of the operation of this law, effects which cannot be attributed to any immediate cause may be traced to existing in other incarnations of the same; thus establishing one's ultimate responsibility for whatever may befall him. Furthermore, owing to this law, one may do at any moment of his present life to the past of his own or of another's that is illusory. or definite effects in the subtler order of things.
resulting in conditions for his next earth life wholly of his own making.

Thoughts build character,
Desires make opportunities,
Actions make environments.

So that whatever one may suffer or enjoy, attain to or fail from is brought about as the result of his own action, in obedience to this law of absolute justice. It is the alternate experience of pleasure and pain which man encounters during his stages of ignorance that develops within him wisdom; and the opportunities guaranteed to him for the accomplishment of this end through Reincarnation and Karma are well nigh limitless. These two doctrines are perhaps the most far-reaching of all the theosophic teaching, as they seem to clear up a host of perplexing questions and establish the basis for a satisfying philosophy.

Propaganda.—Among the results of theosophic propaganda is the restoration to the Western world of the said doctrines of Reincarnation and Karma, and the elimination of the mental incubus of some the teaching of them existing in the East. Another is the occult proof produced of the definite objective reality and potency of thoughts and emotions, showing that these forces are as to their respective planes as visible and real as physical objects are on the physical plane, and that every thought is a living, active entity, persisting for a length of time proportional to the strength that is put into its creation and wields a greater or less influence on those with whom it may come into touch. (See Mr. Leadbeater’s ‘Man Visible and Invisible,’ illustrated, and Mrs. Besant’s ‘Thought Forms,’ illustrated.) Still another is the order which it has brought out of the chaos of the apparently unrelated data of metaphysics, mysticism and the neo-psychology, including the facts of clairvoyance, clairaudience, mesmerism, hypnosis, telepathy, astrology, apparitions, psychometry and the like. And still another is the establishment by irresistible evidence of the basic unity of all the great world religions and their fundamental religious relation to the unprejudiced and open-minded science. To help the religions to clear away their non-essential accretions, to sink into insignificance doctrinal differences, to bring to the fore their points of unity, to study the analogues of moral and spiritual brotherliness and to help each from his own particular standpoint is one of the chief ends to which the theosophist bends his efforts. He does not seek to found a religion, but to expand those we already have, and so give them a deeper meaning and a richer life. While the theosophist limits himself to no particular form of creed, yet the following three truths may be said approximately to include the broad scope of his belief:

1. God exists, and He is good. He is the great lifegiver who dwells within us and without us, is undying and eternally beneficent. He is not heard, nor seen, nor touched, yet is perceived by the man who desires perception.

2. Man and the future are one whose glory and splendor have no limit.

3. A Divine law of absolute justice rules the world, so that each man is in truth his own judge, the dispenser of glory or gloom to himself, the deceiver of his life, his reward, his punishment.

Occultism.—Unless he finds the religion to which he happens to be connected insufficient to meet the demands of his higher nature, the theosophist is apt to seek through the esoteric side of his philosophy the greater light of occultism, in order that he may prepare himself for a more serious religious life. Occultism, as distinguished from the Occult Arts, or Magic, is that system of endeavor which, teaching the methods whereby the personality, or lesser, or more human side of man, may be expanded and expanded his higher or divine nature, leads its votaries along a difficult and narrow pathway of rigid virtue and mental and emotional control, and so requires a firm moral foundation upon which to build the extraordinary powers pertaining to the unseen world. The true Occultist possesses unselfishness, justice and true knowledge; he has compassion and wisdom; his desire nature is purified and his habit of mental concentration fixed; the contents of his consciousness are something more than his five-sense perceptions plus the deductions he draws from them by his reason, and such vague ideas and intuitions as he may possess.*

Through Occultism the aspirant, wearying of the phenomenal world, seeks to outstrip his fellows in evolution and within a few strenuous incarnations to accomplish what the mass of humanity in the normal course will only attain to in long reaches of time, namely, the highest adeptship or liberation from the wheel of rebirth. In doing so he treads a path which, according to occult teaching, has three great divisions:

1. The probationary period, before any definite pledges are taken or initiations (in the full sense of the word) are given. This carries a man to the level necessary to pass successfully through what in theosophical books is usually called the critical period of the fifth round.

2. The period of pledged discipleship, or the path proper, whose four stages are often spoken of in Oriental books as the four paths of holiness. At the end of this the pupil obtains adeptship—the level which humanity should reach at the close of the seventh round.

3. What may be called the official period, in which the adept takes a definite part (under the great Cosmic Law) in the government of the world, and holds special office connected therewith, but none of the details of this period can be made known.

The probationary path has five stages but the division between its stages is less distinctly marked than those of the higher groups, and perfection is not required in anything during this period, only a serious effort toward it. In the first stage the candidate for adeptship acquires a firm intellectual conviction of the impermanence of mere earthly aims; in the second a perfect indifference to the fruits of his own action; in the third (a) perfect control of mind, (b) of conduct, (c) a generous toleration, (d) endurance, (e) one-pointedness, (f) confidence in his Master and himself; in the fourth an intense desire to work with the Master; and in the fifth he gathers up and strengthens his previous acquisitions for the next great step, which will set his feet upon the path proper as an accepted pupil. During his life on the probationary path the pupil will have received much teaching from his Master, usually imparted
during the sleep of his physical body, while he himself is clad in his astral body in full consciousness on the astral plane. He will also have been taught while thus functioning in the astral world to bring help and comfort to the inhabitants of that world, who having laid aside their physical bodies at the gateway of death have passed beyond the physical plane. This phase of occult work is sometimes called that of the Invisible Helpers and is performed, be it understood, by men still having physical bodies and who have developed this power of functioning consciously outside the same on inner planes. The pupil will further have been trained in meditation, and this effective practice both in waking consciousness and outside the physical body during its sleep will have quickened and brought into active exercise many of the higher powers.

When the pupil has developed the fifth qualification of the initiation path he is ready for initiation upon the part proper, henceforth to serve his Master, whom he now meets face to face, in helping forward the evolution of the race, his life, "to be offered up on the altar of human evolution," is called for, to be used for the common good. This path consists of four distinct stages and the entrance to each is guarded by an initiation. The second initiation can be passed the pupil must lose the illusion of personal self is a reality, and must feel himself one with all; he must destroy doubt and superstition by knowledge; ere he passes the third he must bring into full working order the inner faculties, those belonging to the sublimer bodies; now he needs to incarnate but once again; ere the fourth is passed he must dispense with all desire and aversion and see the One Self in all. At this stage he needs to return no more. The fourth initiation admits him to the last stage of the path where he throws off all clinging to life in form and all longing for even formless life. Then he casts off the "I-making" faculty—pride, irritability and ignorance, and henceforth dwells on the plane of unity. The man is then perfect, a free, the liberated one. He has won Nirvana. "He has completed man's ascent, he touches the limit of humanity; above him there stretches hosts of Mighty Beings, but they are superhuman; the crucifixion in flesh is over, the hour of deliverance has struck and the triumphant 'It is Finished' rings from the conqueror's lips, he has vanished into light nirvanic. But being now Master of Compassion as well as Master of Wisdom, he returns from that light to earth, henceforth to devote himself to the service of humanity with mightier forces at his command than he wielded while he trod the path of discipline, binding all his sublime powers to the quickening of the evolution of the world. Such an one was the Buddha—such tireless worker that Souls who tread the earth today, seduced from its external strife, yet pouring down upon mankind from the great heights of their sublime advancement—may findest blessings guidance by means of their divine powers whole races and nations, but unknown to all but the few earnest souls who open their minds through the ancient gateway of Occultism, the portal of which has throughout the cycle of time shall close and all manifestation cease, the greater portion of man-kind will have reached this high stage growth. And then shall all be gathered to Him for the cosmic rest only after aeons of time, to emerge again with Him to be the architects and builders of the new universes. Such are a few of the teachings of the Ancient Wisdom, given forth as Thesosophy and Occultism.

A. P. WARE

Fellow of the Theosophical Society

THEOTOKOS, a title given to the Virgin Mary by a decree of the Third Ecumenical Council, which met at Ephesus 431 to condemn Nestorian heresy. The term means 'mother of God' and is intended for
applied in the annunciation of the angel to
"that holy thing which shall be born
e shall be called the son of God." Theo-
(Latin, Deipara) implies that the child
ry was of divine nature from the moment
conception; that he was not born mere
whom, as Nestorius taught, the divine
was subsequently imparted.

THERA, thá-ra or thér-a, an island in the
1 Sea, belonging to the Grecian Archi-
that most southerly of the Cyclades. It
volcanic formation and presents many in-
ning phases. New islands are formed from
time, by its volcanic action, notably the
1866. Scientists have given the island
erable attention and many observations
seen made and records kept. The soil is
ertile.

THERAMENES, thér-am'-é-nez, Athenian
ian of the 5th century B.C. He first be-
prominent in 411 as a member of the
if of 406, but perceiving the inevitable
of that government he joined the
party and assisted in its overthrow.
B.C. he was in command of a portion of
henian fleet, with which he cruised about
acted tribute from the neighboring is-
and later he joined the fleet under
bulus, with whom he took part in the
of Cyzicus. He subsequently served with
ues, participated in the siege of Chal-
406 B.C. and in the capture of By-
. After the battle of Arginusae, in 406,
aired to Athens, and in order to exculpate
for not saving the crews of the ships
d his colleagues of neglect, and through
stimony they were sentenced to death.
B.C., when Athens was besieged by the
n general Lysander, Theramenes was
an envoy to negotiate terms with Sparta.
proselytly remained on his mission for
months, during which time Athens was
d to dire extremity and was forced to
peace upon such terms as to place her at
ercy of the Lacedaemonians. He was
one of the Thirty Tyrants (q.v.) after
ce, and at first heartily supported the
es of the government. The violent
res of Cassandria and his colleagues, how-
duced him to form an opposing party,
aptly increased in strength. He was
d by Critias of being a public enemy,
d to prison and forced to drink the
k.

THERAPEUTICS, that branch of medicine
deals with the treatment of disease.
ies; physicians treat. This is an old
as true to-day as it was when uttered
000 years ago by a famous Greek phys-
icians. They have noted that power of the
body the vis medicatrix nature
of which nature tends to right her own
eded organs, and it is important to recog-
is all-important function of the body, and
fer to overzealousness in the use
ents with the natural powers of self-restoration. An innu-
alf-hearted therapy, however, is not
ical system, even if such reconstructive
of nature are granted. The modern
ion of disease does not admit of ready
ication. In the articles on disease and
vy (q.v.) it is attempted to define what
is meant by disease, but such definitions are far
from being satisfactory because of the im-
mense variety of diseased conditions, their
omand causation and their devious progres-
sions. In all disease certain groups of physio-
ological functions are altered, and in the at-
tempt to aid nature to bring these disturbed
physiological activities to a normal condition
the chief work of the therapist lies. It
akes little or no difference what the agencies
ay be that are used — certain, as has been said,
one are not necessary — yet the ideal of the ther-
peutic art is to restore to normal condition, as
ar and as quickly as possible, the disturbed
odily functions. While it is true that the
ician of to-day employs many of the agents
used by physicians thousands of years ago,
ere is a far greater precision and a much
more comprehensive series of ideas concerned
in their use by the well-equipped modern thera-
peutist than was possible to his early predeces-
sors. The one aim of the physician throughout
the centuries has been the alleviation of suffer-
and the restoration of the diseased to health
or to comfort; and notwithstanding the many
small cliques and divergences of opinion, the
progress toward scientific therapeutics has been
steadily and increasingly satisfactory. At the
out of this summary of therapeutics it may
be well to consider for a moment the different
classes of agents at hand by the use of which,
singly or combined, the physiological functions
of the body may be modified, and thus be made
useful in the healing art.

Expressed categorically, the different ther-
peutic agents or systems are: (1) Sugges-
therapy; (2) Dietotherapy; (3) Physico-
therapy; (4) Mechanotherapy; (5) Phama-
otherapy; (6) Surgotherapy. Each of these will
be briefly discussed.

Unquestionably the oldest and yet strongest
therapeutic agent is suggestion. The power to
heal by faith is not the special property of any
sect or class, nor the exclusive right of any sys-
tem. Belief in gods and goddesses, prayer to
ids of wood, of stone, of gossamer fiction,
faith in the doctor, belief in ourselves engen-
dered from within or from without — these are
all expressions of the great therapeutic value
for healing that resides in the influence of
mental states on bodily functions. These will
not move mountains; they cannot cure consump-
tion; they do not influence a broken leg, nor an
organic paralysis; but suggestion, in its various
forms, may be and is one of the strongest aids
to all therapeutic measures. Of its abuse by
designing hypnotists, blackmailers, clairvoyants
and a motley crew of parasites, space does not
permit particularization. The human mind is
credulous — it believes what it wants or wills to
believe; and the use of suggestion in thera-
petics is one of great power for good and for
evil.

The treatment of disease by diet constitutes
another large branch of the therapeutic art.
Modern chemistry has resolved all foods and
drinks into their elements, and has given the
physician valuable aids in the treatment of a
large number of diseases. Many obscure dis-
orders, such as diabetes, gout, myxedema, obe-
ity, etc., are closely allied with certain defects in
the metabolism of certain physiological systems
of the body. Many of these are best treated by
a dietary regimen, combined, it may be, with other means. Many of the minor disorders of the digestive tract (see Digestion) are best treated by regulation of the diet.

By physiotherapy is meant the use of certain physical agents such as heat, cold, light, electricity, etc. Certain forms of application of the agents are termed (a) hydrotherapy (q.v.), in which heat and cold are applied by means of water; (b) phthotherapy (q.v.), in which light is incident in the treatment of disease; Sunlight, electric light, ultra-violet rays (Finsen's light), X-rays, radio-active substances—these all exert on the tissues of the body certain influences that, properly applied, may bring about restoration of disordered functions, and thus aid nature in curing disease.

Mechanotherapy is the use of mechanical movements in treatment. Massage, vibration, gymnastics, Swedish movements, etc., are some of the different forms in use. Under the name of osteopathy (q.v.) it is attempted to elevate one of the oldest aids to treatment, in use by the Greeks, Chinese, etc., to the rank of an exclusive system.

Under the terms pharmacotherapy and surgico-
therapy are included the treatment of disease by drugs, so-called, and by surgical means. So far as treatment by means of drugs is concerned, it is interesting to note that practically all drugs act on the tissues of the body in some chemical or physicochemical manner. They may have a certain selective action on certain tissues of the body. Thus the large group of the alcohols, comprising ethers, aldehydes, chloroform, hypnotics—such as trional, sulphonial, veronal, urethane and a large number of others—have a selective action on the nervous tissues of the brain, blemishing their activities and causing drunkenness or anaesthesia or sleep, according to the dose or other conditions. Others act on sensory nerves, diminishing pain; such are cocaine, opium, antipyrin, acetaminol, phenacetin, camphor, etc. Again, other remedies are chiefly on the intestines, giving the large group of cathartics, and so the entire list of drugs might be analyzed. Given a knowledge of the selective or generalized action of the drugs, the use that they may exert in combating various physiological activities is but a matter of application and in accordance with the correct interpretation of the cause of the disturbed functions will the therapeutic application be of direct value or not. In other words, drugs are nothing more than chemical agents which may be used to modify certain physiological activities; if by their well-known power in modifying these activities other morbid activities may be corrected, they are agents for good. For a consideration of surgicotherapy, see Surgery.

One other phase of therapeutics remains to be considered. It has been pointed out that nature has resources of her own for overcoming certain types of disease. Can these natural powers be so played upon or affected as to increase their operation? Along this line new paths have been opened up since the recognition of a large class of diseases known as infectious. Bacteriology (q.v.) has taught that disease organisms (bacteria) cause the disturbance (disease) in the body, not so much by their physical presence as by the extremely virulent poisons that they form. It is the same with the human body to get rid both of bacterial poisons that makes the disturbance called the disease. Thus the typhoid is one of nature's efforts to put death-blow to the pneumococcus, the organism that causes the disease. Such a temperature in malaria (q.v.) as kills off a great many of the parasites of blood.

But in addition to these larger and palpable efforts on the part of nature to come the invader, a series of subtle, effective defenses are at work in the body. Some of the elements of which are thus in some diseases there is evidence of a blood-serum a direct chemical antagonist, to the poisons of the invader. Such a protective power is diphtheria (q.v.). (See Antitoxin.) In addition, the discovery of which was a result of an accident, is a form of serum. (See Serum Therapy.)

The reasons why immunization is considered a modified smallpox of the cow are not yet as the true cause of smallpox is not indubitably proven, but the time is not far off when different factors herein involved will be earthed. A large number of other questions concerned in this great question of acquired immunity (q.v.)

Human progress has been likened to the ups and downs and side-lurchward steps in the path of therapy as been many; but withal there has been are a blaze of progress. That which has been found to be true has been has become the heritage of the world. The physician class has been the people at large in the general use, there have been many side-tracks or broad road of therapeutics; innumerable have had their little day or their 100 each in its turn has contributed to the equilibrium of the

THERAPIA, a health resort porus, nine miles north-northeast of Canopus, of which city it is a ancient Pho.
Medea spread her drugs. One of the patriarchs of Constantinople changed to Therapia ("cure"). It marks a string between what is locally called the Bosphorus and the Lower Bosphorus. The summer residences of European lords, Turkish officials and wealthy.

**RESA, Saint.** See TRESA, SAINT.

**RESIOPEL, tér-á-zé-ó-péll, or MA-ERESIOPEL, má-řeá-tér-á-zé-ó-péll Szabadka.** Hungary, a royal free town on the Bacs-Bodrog, 25 miles south of Szegedin, in a broad plain between the Theiss and the Theiss. The buildings worthy of note are the churches of Saint Theresa, if the Franciscans, a beautiful Greek town-house, etc., theatre, barracks, and music-school. The industrial clades tanneries, linen and leather manufакture, and dye works. Wheat, tobacco, wines are grown and cattle-raising is important.

There is a brisk trade in horses, cattle, hogs, hides and wool. There is a useful watering-place in the vicinity. Pop. 20.

**RIAC, or THERIACA,** a compound have been first prepared by Andromachus of Crete, who was physician to Nero. It was supposed to be an antitoxin, and continued in use throughout the life of the Emperor. As prepared in Venice and shown to the emperor it was a compound of 64 drugs, and reduced by means of honey to the size of a drachm (q.v.), large extinct carnivorous with shortened coracoid and double-tusked.

**RMÉ, thérmé (from the Greek signifying originally warm or hot properly warm baths, but also applied to the baths of the ancients. During an Empire the buildings for this purpose were large and the baths were kept at suitable temperatures.) The baths of Nero, ara della and Dioecetian at Rome were the most magnificent and luxurious in the world.

**RMA SPRINGS.** See SPRING.

**RMIC FEVER.** See SUNSTROKE.

**RMIDOR, thérm-i-dôar. (Fr. tém-mé, 11th month of the year in the calendar of the first French republic. It contrived with other chemical amalgamations to form a compound of the by alcoholic fermentation, or when a body or system (such as a solution) undergoes certain kinds of physical change. Its precise limits are not easy to define, since the subject merges into ordinary chemistry on the one hand and into thermodynamics on the other. Any chemical operation can be considered from two points of view, according to the importance of the modification that it produces in the nature of the substances that are involved or in the quantity of energy which is absorbed, liberated or otherwise transformed at the same time. It is the province of thermochimistry to investigate the transformations of energy that occur in such cases. The complete discussion of the energy-transformations that accompany a given chemical change should include the consideration of every type or form of energy which may be present: but the investigations which have hitherto been made have related chiefly to the quantities of heat which are liberated or absorbed, and it is to this circumstance that the term now owes its present name, "thermo-chemistry.""

When these are ignited in a properly prepared crucible violent reaction takes place, the oxygen of the oxide being taken up by the aluminums, leaving a very pure metal, nickel, cobalt, etc. This process is now much used to get metals from those oxides that hitherto have resisted all ordinary methods of reduction. When ordinary permutant is ignited the temperature produced is so high that the iron and the slag are left in a molten and highly-heated condition. If this iron is allowed to flow on to another piece of iron or steel it will heat it enough to soften it and the whole will harden to a homogeneous mass. In this way it can be used to replace broken parts of machinery, to mend broken or cracked propeller shafts, to weld together railroad rails so as to form one continuous rail, etc. Some of the important features in this process are its cheapness, ease of execution and the fact that machinery, etc., can be repaired in position. The method is to surround the part to be repaired with an ordinary mold box; a magnesium-based crucible with a plug in the bottom is placed over the opening; the thermit is placed in the crucible, ignited and as soon as the violent reaction has subsided the plug is pulled and the white hot metal allowed to flow into the mold. Iron tubes can be welded together by placing the ends in a mold and allowing the thermit product to flow in such a way that the liquid slag first comes in contact with the tubes. The slag forms a protective layer and prevents the hot iron from uniting with them, though it does allow the tube ends to become hot enough to unite as one piece. Railway rails can be joined where they lie on the track, and large pieces of broken machinery in mines or on shipboard can be readily repaired without removal.

**THERMO BAROMETER.** See THERMOMETER.

**THERMO-CHEMISTRY, or THERMAL CHEMISTRY,** that branch of physical chemistry which deals with the chemical changes which occur when chemical reactions take place or when a body or system (such as a solution) undergoes certain kinds of physical change. Its precise limits are not easy to define, since the subject merges into ordinary chemistry on the one hand and into thermodynamics on the other. Any chemical operation can be considered from two points of view, according to the importance of the modification that it produces in the nature of the substances that are involved or in the quantity of energy which is absorbed, liberated or otherwise transformed at the same time. It is the province of thermochimistry to investigate the transformations of energy that occur in such cases. The complete discussion of the energy-transformations that accompany a given chemical change should include the consideration of every type or form of energy which may be present: but the investigations which have hitherto been made have related chiefly to the quantities of heat which are liberated or absorbed, and it is to this circumstance that the term now owes its present name, "thermo-chemistry."

The quantity of heat that is liberated or absorbed during a proposed chemical reaction can be determined by causing the given reaction to take place in the interior of a calorimeter. The
particular form of calorimeter that is to be used will naturally depend to a considerable extent upon the nature of the reaction that is to be studied. If the problem consists in the determination of the quantity of heat that is liberated when two given liquids are mixed, the calorimeter commonly consists of a platinum vessel, capable of containing from 500 to 1,000 cubic centimeters, placed inside of another vessel of silver; the space between the two vessels being filled with water. The liquids that are to be mixed are usually introduced into the vessel at the same temperature as nearly as possible, and are then mixed in the platinum vessel. The rise of temperature of the calorimeter being noted, and the masses and specific heats of the various parts of the calorimeter (and its contents) being determined by separate experiments, we are then in position to calculate the quantity of heat energy liberated by the reaction. For detailed information with regard to the various kinds of calorimeters that are used, and for a discussion of the errors to which such instruments are liable, reference must be made to extended works upon heat and thermo-chemistry. (See the references at the end of this article).

In thermo-chemical work, the unit of mass is almost invariably the gram; and the gram is specifically mentioned. The unit of heat is also understood to be the calorie, which, for thermo-chemical purposes, is defined as the quantity of heat required to raise the temperature of one gram of water by one Centigrade degree, when the temperature of the water is in the vicinity of 18° or 20° C. The notation that is employed in expressing the results of a thermo-chemical experiment upon the heat that is developed by a given chemical reaction is simple. The formula of the substances that react are written within square brackets, and separated by a comma or a colon; it being understood that the number of grams that are present of any one substance is equal to the molecular weight of that substance. A sign of equality is written after the bracketed formula, and on the right hand side of this sign the number of calories of heat generated or absorbed by the reaction is written; a positive sign being prefixed (or omitted) when heat is evolved, and a negative sign when it is absorbed. The indices that are attached to the symbols of the various elements are written above those symbols, instead of below. For example,

\[ \text{H}_2\text{O} \quad \text{or} \quad \text{H}_2\text{O} \quad \text{or} \quad \text{H}_2\text{O} \]

signifies that when two grams of hydrogen and 16 grams of oxygen, both at about 18° C and under atmospheric pressure, combine to produce 18 grams of water (also at 18° C), the quantity of heat that is evolved is sufficient to raise the temperature of 2 grams of water by one Centigrade degree; the temperature of the water being about 18° C.

When a compound is broken up into its constituent parts, the bracketed formula are preceded by a negative sign. Thus the expression

\[ \text{H}_2\text{O} \quad \text{or} \quad \text{H}_2\text{O} \quad \text{or} \quad \text{H}_2\text{O} \]

signifies that when, by any means, 36.5 grams of hydrochloric acid are decomposed so as to set free 1 gram of hydrogen and 35.5 grams of chlorine, the change is accompanied by the sorption of a quantity of heat that is sufficient to raise the temperature of 1 gram of water by 1° C.

The heat of formation of a substance is formed from its constituents, as is taken as negative when the formation of substance is accompanied by the absorption of heat. In general, any given substance prepared in various ways, from different or constituent substances, the same case of formation will be different, according to the particular substances that are regarded as constituents. For example, sulphuric acid is prepared from sulphur, oxygen and according to the equation

\[ \text{S} + \underbrace{\text{O}}_{3 \text{O}} + \underbrace{\text{H}_2\text{O}}_{3 \text{H}_2\text{O}} = \underbrace{\text{H}_2\text{SO}_4} \]

or from sulphur dioxide, oxygen and according to the formula

\[ \text{SO}_2 + \text{O} + \underbrace{\text{H}_2\text{O}}_{3 \text{H}_2\text{O}} = \underbrace{\text{H}_2\text{SO}_4} \]

or from sulphur trioxide and water; according to the equation

\[ \text{SO}_3 + \text{H}_2\text{O} = \underbrace{\text{H}_2\text{SO}_4} \]

and the heat of formation will be different in these several cases, if we regard the materials from which the acid is formed as the constituents of the acid. But if prepared from the elements sulphur, oxygen and oxygen (all three being in certain standard initial physical states instance), then the heat of formation is the same, whether these elements completely form the acid, or whether the heat of sulphur and hydrogen are first prepared and these subsequently combine to form acid. In fact, the principle of the conservation of energy shows that when a system of bodies passes through a succession of changes, either physical or chemical in nature, so as to pass from one given initial condition to another given final state, the total change that the system undergoes in its internal energy of the body or system is exactly the same, whatever the nature of the transformation may be, by which the change is effected. Hence it follows that the heat that is emitted or absorbed represents a measure of the decrease or increase in the internal energy of the system, the total quantity of heat emitted or absorbed will be independent of the way in which the transformation takes place. If, however, the system forms external mechanical work in from its initial state to its final state, energy that is actually given off will be less than that corresponding to the change in internal energy by the amount expended in performing the external work. Many of the reactions that are considered under thermo-chemistry, the external work performed is too small to be of any significance, and in these cases the change in internal energy is regarded as independent of the kind of information that the transition involves. Some cases, however, and particularly those systems under consideration are wholly exogenous, the external work that is formed is great enough to require...
THERMO-DYNAMIC ENGINE—THERMODYNAMICS

Thermodynamics, or the mechanical theory of heat, that branch of physical science which treats of the relation of heat energy to energy of other kinds, and particularly of the convertibility of heat energy into mechanical energy, and the converse. In order to discuss, qua the conversion of one kind of energy into another kind, we must first have a definite method of measuring each of them. Mechanical energy (see ENERGETICS) is measured by determining the amount of work that a given quantity of it can perform; the customary unit employed for this purpose being the "foot pound" or the "metre-kilogram" in engineering practice and the "erg" in scientific work; the "erg" being defined as the quantity of work done in overcoming a resistance of one dyne through a distance of one centimetre. The unit employed in the measurement of heat is almost universally the quantity of heat required to raise the temperature of some definite mass of water through one degree, on some stated part of the thermometric scale. The ordinary "British thermal unit," which is used in engineering practice in English-speaking countries, is the quantity of heat required to raise the temperature of one pound of water by one Fahrenheit degree; and in countries that use the metric system, the engineering unit is the quantity of heat required to raise the temperature of one kilogram of water through one centigrade degree. As the specific heat (q.v.) of water varies slightly at different temperatures, these definitions are not absolutely definite, unless the part of the thermometric scale at which the experiment is to be performed is specified. Unfortunately there is no general agreement among engineers on this point; and for most purposes in practical engineering it is customary to ignore the slight variation in the specific heat of water and to consider the foregoing definitions to be sufficiently precise as they stand. For scientific purposes, where the greatest possible accuracy is required, this course is not permissible, and it becomes necessary to specify the particular degree through which the temperature of the water is to be raised. Even here there is no definitely established convention; but there appears to be a growing tendency to adopt the degree that extends from 14.5° C. to 15.5° C. In scientific work, too, it is customary to define the thermal unit in terms of a gram of water, instead of a kilogram; and the scientific heat unit (which is called the "small calorie," to distinguish it from the "greater calorie" that is used in engineering) may be defined as the quantity of heat required to raise the temperature of one gram of water from 14.5° C. to 15.5° C.—0.01° C. being the temperature at which water has its maximum density—is also known as the "therm." The science of thermodynamics is founded upon two general, fundamental laws, which, so far as we are aware, are absolutely rigorous and which are respectively known as the "first"
and "second" laws. These we shall consider in order.

The "first law of thermodynamics" is nothing but a special application of the general principle of the conservation of energy. (See ENERGETICS.) It states that whenever heat energy is converted into mechanical energy (or the reverse), then for each unit of one kind of energy that disappears there is always a perfectly definite and constant quantity of energy of the other kind which appears. Mayer and Joule, independently, arrived at this law in the year 1840. There has been in the past some considerable controversy as to the credit that should be assigned to these respective investigators. We cannot enter into this discussion, but the reader who desires to follow it up will find an admirable and very fair statement of the facts of the case in two papers on the Copley medals of 1870 and 1871, in Tyndall's "Fragments of Science." Joule did a vast amount of experimental work for the purpose of confirming the first law of mechanical equivalent of heat, as the constant is called, which expresses the number of units of mechanical energy that are equivalent to one unit of heat; and in the course of his labors he tried the different experimental methods (Consult 'The Scientific Papers of James Prescott Joule'). His best known method consisted in stirring a known mass of water and measuring the rise in temperature so produced as well as the quantity of mechanical energy expended in the stirring. He concluded that the temperature of one pound of water is raised by one Fahrenheit degree by the expenditure of 772 foot-pounds of mechanical energy. This constant, which is known as "Joule's equivalent" and is denoted by the symbol J, has played an all-important part in engineering and scientific work for more than half a century. A better value of it was obtained by Rowland in 1879 (consult 'The Physical Papers of Henry Augustus Rowland'); but the prestige of Joule was so great that the superiority of Rowland's work was not generally recognized for many years. Rowland's method was similar to that of Joule, but he worked with far better apparatus, and the result is generally given as 0.001785 B.S. foot-pounds. It had been made since Joule's work was done, both in calorimetry and in thermometry. It was in the course of this work that Rowland made the discovery that when temperature is defined in accordance with the scale of the normal constant-volume air thermometer, the specific heat of water has a minimum value at a little above 30°C,—a discovery which implies a high degree of precision in the experimental methods employed, and which has been abundantly verified by later investigators. Rowland's value of the mechanical equivalent of heat may be stated as follows: Taking as the unit of heat the quantity of heat required to raise the temperature of one kilogram of water from 14.5°C to 15.5°C, the mechanical equivalent is 427.4 kilogram-metres at sea-level in the latitude of Baltimore. If the unit of heat is the quantity of heat required to raise the temperature of one gram of water from 14.5°C to 15.5°C, then the mechanical equivalent is 41,890,000 ergs. Numerous other experiments have made determinations of the mechanical equivalent, both by the method followed by Joule and Rowland, and by other methods. Prominent among these are Griffiths, who heated the water in his calorimeter mainly by means of a known resistance, and hence giving out a known quantity of heat. Taking as a unit of heat the quantity of heat required to raise the temperature of a kilogram of water from 14.5°C to 15.5°C, it is found that the mechanical equivalent is 427.45 kilogram-metres at sea-level in the latitude of Greenwich. Rowland's value, when expressed in these same units and corrected to the latitude of Greenwich, is 427.0. For further details concerning the experimental determination of the mechanical equivalent consult Preston, 'Theory of Heat'; and for numerous interesting illustrations of the first law of thermodynamics, consult Tyndall, 'Heat a Mode of Motion.'

The second law of thermodynamics is hard to explain in a limited space, or without the use of higher mathematics; and, as Rankine remarked, its exposition has been much neglected by the writers of popular works, so that "inexplicable" and "impossible" are terms that are often used to describe what actually happens, or what really must happen to satisfy the second law of thermodynamics. It is unique in its form, the second law merely states that heat always tends to pass from a hotter body to a colder one. This fact is obvious enough in simpler manifestations; for every housewife knows that to make the kettle boil she must put it on the stove and not in the refrigerator. It is not so evident, however, that there are no conditions whatever under which heat will pass of its own natural tendency from a lower temperature to a higher one. It is not evident on first thought, for example, that we cannot make a burning glass big enough to give a temperature at its focus, which shall be higher than the temperature of the sun; yet we cannot do so, if the advances that have been made since Joule's work were done, both in calorimetry and in thermometry. It was in the course of this work that Rowland made the discovery that when temperature is defined in accordance with the scale of the normal constant-volume air thermometer, the specific heat of water has a minimum value at a little above 30°C,—a discovery which implies a high degree of precision in the experimental methods employed, and which has been abundantly verified by later investigators. Rowland's value of the mechanical equivalent of heat may be stated as follows: Taking as the unit of heat the quantity of heat required to raise the temperature of one kilogram of water from 14.5°C to 15.5°C, the mechanical equivalent is 427.4 kilogram-metres at sea-level in the latitude of Baltimore. If the unit of heat is the quantity of heat required to raise the temperature of one gram of water from 14.5°C to 15.5°C, then the mechanical equivalent is 41,890,000 ergs.
higher temperature to a lower one, in the same way as we think of water tending down hill. Water will not run up its own accord, but it may be forced to run down a lower level to a higher one by the force of energy upon a pump or other device. The correctness of Clausius’ sism with regard to heat is substantiated by the fact that no case has yet been discovered where it is demonstrably violated. On the other hand, many previously unknown phenomena in every instance subsequent experiment has confirmed the prediction in every respect. A short account of some of the better objections that have been urged against the second law, consult the portion of Brown’s translation of Clau-
 Mechanical Theory of Heat, studying the transformation of heat into mechanical energy (or the reverse) is customary to think of the con-
 as being performed by a suitable type of engine; for this conception helps to make the problem definite, so that the mind can grasp the principles involved. The heat engine is usually conceived to be in construction, so as to run without and without loss by radiation or convection. In fact, the materials of which it is composed is assumed to be incapable of absorbing any heat at all. Some of its parts, however, be transparent to heat, and others to olutely opaque to it; and we may be convinced, by the discussion of the effects, whatever those may be. These remarks are usually assumed, further, to be perfectly reversible, so that when the expenditure of mechanical power, they are used backwards, all of the normal effects of the engine take place precisely as they are reversed in a contrary sense. If, for example, the engine, at some instant in its formation, absorbs a quantity of heat from outside body whose temperature was lower than when the engine reaches the corrected state in its reversed motion, it must at this same quantity, Q, of heat, and give it out again to the same body from it originally abstracted it, and at the temperature, T. An engine which fulfills these various conditions is called a tly reversible engine; or, more briefly, an ideal engine. Carnot’s Theorem.—In 1824 Carnot gave a theorem (consult his Reflections on the Motive Power of Heat, Thurstons’s projection), which may be stated in the following form: Of all the possible kinds of engine, which run by converting heat into mechanical energy, and which take the same amount of heat at one temperature and reject all the heat they do give out (if any) at any other temperature, there is none that is more efficient than the ideal, reversible engine; efficiency being defined as the fraction of the available working energy that is converted into actual work. This theorem is of exceeding importance, as it holds true not only for the untold thousands of kinds of ideal engines that we might be able to think of at the present time, but also for any others that may depend upon principles of nature as yet undiscovered; always supposing that the two fundamental laws of thermodynamics, as stated above, are true. In Carnot’s time, heat was believed to be a substance; and Carnot’s proof of his theorem is based upon this view. After the newer conception of heat had been attained, however, it became possible to show by equally sound demonstration in accordance with the two thermodynamic laws now admitted. The proof is as follows: Let us assume that the theorem is false, and that there is some other engine, which we will designate as B, which is more efficient than some particular ideal reversible engine, A, which runs between the same two temperature limits. Let T1 be the temperature at which both engines take their heat, and let T2 be the temperature at which each rejects such heat. If A does not transform into work. Let H1 and H2, respectively, be the quantities of heat taken in and rejected, during a given time, by the reversible engine, A, and let H’1 and H’2 be the quantities taken in and rejected, respectively, by another engine B. The quantities of heat that are transformed into work by A and B, respectively, are then (H1 - H2) and (H’1 - H’2); and the efficiencies are respectively (H1 - H2)/H1 and (H’1 - H’2)/H’1. The condition that we are assuming, in violation of the theorem, is that the efficiency of the engine B is greater than that of A; that is, (H’1 - H’2)/H’1 > (H1 - H2)/H1; or, what is the same thing, H1(H’1 - H’2) > H’1(H1 - H2). Now suppose that the two engines are coupled together so that the engine B runs forward and drives the reversible engine, A, backward. Then A, owing to its reversibility, for every (H1 - H2) units of work that it absorbs, takes in H2 units of heat at the temperature T2, and rejects H1 units of heat at the higher temperature, T1; while the other engine, B, for every (H’1 - H’2) units of mechanical work that it performs, takes in H’1 units of heat at the higher temperature T1, and rejects H’2 at the lower temperature T2. Now in the case supposed, where one of the engines drives the other, the mechanical energy developed by the engine B is entirely absorbed by the reversed engine, A. Hence we have (H’1 - H’2) = (H1 - H2); and this equation, taken in connection with the foregoing inequality, gives H1 > H’1. That is, the heat delivered by the doubled engine to the source whose temperature is T2, is greater than the heat that is being withdrawn from that source; so that if we regard the doubled engine as a single machine, we have a case in which heat is passing, by its own natural tendency and without external compulsion, from a temperature T2 to a higher temperature, T1. But this is contrary to the second law of thermodynamics; and hence it follows that it must be that no such engine as B exists. In other words, there is no engine which takes its heat all at a temperature T1, and rejects what it does reject at a lower temperature T2, which has a higher efficiency than the ideal reversible engine running between these same
.temperature limits. It will be observed that in case both of the engines are reversible, the foregoing proof can easily be made to show that neither one is more efficient than the other one. It follows, therefore, that all ideal reversible engines which take in no heat except at \( T_h \) and reject none except at \( T_c \) have the same identical efficiency; and this efficiency can, therefore, depend upon nothing but the two temperaturas \( T_h \) and \( T_c \) and the state of the heat absorbed and rejected by an ideal reversible engine in which the arrow is reversed by the expansion of air indicated that the numerical values of the function \( F(T) \) can be expressed in the form \( F(T) = \frac{C}{T} + C + x \), when \( T \) is the temperature according to the normal, constant, and absolute scale (see Thermometry); \( C \) being a constant and \( x \) a small variable term, whose value between the freezing and boiling points of water, never exceeds a very small fraction of a degree. For the details of the method by which the numerical values of the function \( F(T) \) are evaluated, reference must be made to special works on thermodynamics, and to papers on the subject of absolute temperature. (See Heat.)

It is sufficient, here, to say that by the application of the two fundamental principles of thermodynamics to the phenomena that occur when a mass of gas changes its state by an infinitesimal amount, it is possible to deduce a differential equation which, when integrated for the conditions that prevail in a constant-volume thermometer filled with the kind of gas under consideration, will give a finite relation between the scale of the gas thermometer and the absolute scale. One of the most important terms in this differential equation relates to the change of internal energy experienced by a gas when the volume of the gas changes while the temperature remains constant. In order to evaluate this term, special experiments are necessary, in which the gas is caused to change its volume while the temperature is constant. Joule and Kelvin were the first to devise an experiment capable of yielding accurate results of this character, and the work that they did along these lines more than half a century ago has never yet been adequately verified, although it constitutes the only secure basis of all that we know, to day, about the numerical corrections that must be applied to the readings of a gas thermometer. One of the most important terms in this differential equation relates to the change of volume of a gas when the temperature is measured by the normal constant-volume hydrogen or nitrogen thermometer, in

depend, evidently, upon the kind of thermometer that is used in defining the temperature \( T \); but whatever the form of the function may be, its numerical value will always be the same for any fixed temperature \( T \); provided the nature of the thermometric scale may be, from which it is obtained. This follows from the fact that the last equation above must always hold true, and \( H_1 \) and \( H_2 \) are not dependent in any way upon the language of mathematics, the efficiency of an ideal reversible engine which runs as here described is a "function" of the temperatures at which heat is absorbed and rejected, and of nothing else.

In the foregoing demonstration it was assumed that all of the heat taken in by the entire engine \( B \) was either transformed into mechanical energy or rejected at the temperature \( T_b \). If the engine \( B \) is of such a kind that this condition is not fulfilled, by reason of the engine losing some of its heat at temperatures intermediate to \( T_t \) and \( T_b \) (or by reason of any other imperfect in design or construction), then the theorem is still true; for the assumption that we have made above is the one that is least favorable to our demonstration. Absolute Temperature. Let us consider an ideal, reversible engine, which in each unit of time takes in \( H_t \) units of heat at the temperature \( T_t \) and rejects \( H_r \) units of heat at the temperature \( T_r \). Then the efficiency of the engine is \( (H_r - H_t)/H_t \); and this (as we have seen) must be equal to some function of \( T_t \) and \( T_r \). It will be more convenient, however, to write the efficiency in the form \( 1 - (H_r/H_t) \); which is obviously permissible. Since this is a function of the two temperatures, so also is \( H_r/H_t \); and we may write \( H_r/H_t = f(T_t, T_r) \). Now \( H_r \), being the heat rejected by the given engine at the temperature \( T_r \), may be used again in a second ideal reversible engine, which we may assume to take its heat at \( T_r \) and to reject what it does not reject (if any) at some still lower temperature \( T_2 \). The second engine, considered separately, would give a second equation entirely analogous to the one already written; and we should have \( H_r/H_2 = f(T_2, T_2) \). But we might consider the two engines, coupled together, to constitute a single ideal reversible engine, taking in a quantity \( H_t \) of heat at \( T_t \) and rejecting a quantity \( H_r \) at the temperature \( T_r \). From this point of view, we could write \( H_r/H_t = f(T_t, T_t) \). But if we multiply \( H_r/H_t \) by \( H_t/H_t \), we obtain \( H_r/H_t = f(T_t, T_t) \). The function \( f \) must be of such a nature that we have the identical relation

\[
f(T_t, T_r) f(T_r, T_2) = f(T_t, T_2)
\]

whatever the values of \( T_t, T_r \), and \( T_2 \). Examination of this equation will show that the disappearance of \( f \) by the multiplication of the argument of the two terms in the first member involves that the function \( f \) shall be of the form

\[
f(T_t, T_r) = F(T_t) F(T_r)
\]

Hence we have the general relation

\[
H_r/H_t = F(T_t) F(T_r)
\]

\( H_t \) and \( H_r \) being, respectively, the quantities of heat absorbed and emitted by any ideal reversible engine at the temperature \( T_t \) and \( T_r \). From the preceding we must, therefore, reject heat except at \( T_t \) and reject none except at \( T_r \). The algebraic form of the function \( F(T) \) will
the pressure at the freezing point of water at one metre of mercury, and is graduated according to the Centigrade scale to read 0° at the freezing point of ice and 100° at the boiling point. (1) there is a constant term of 273.10° added to the reading of the thermometer in order to obtain the true reading of the instrument on the absolute scale, and also (2) a small variable term, whose value is given in the second and third columns accompanying table.

Corrections here given are different from those usually quoted, but it is believed that they are more accurate. In the case of the hydrogen thermometer, it will be observed that for 50° C. to 100° C. they are negative. It is improbable this change of sign may not in a certain degree be due to differences between the hydrogen and nitrogen ther- mers, as deduced from the corrections given, correspond very faithfully with the differences as observed at the Interna- tional Bureau of Weights and Measures at Paris. In the smallness of the variable part correction, it is usually, in writings upon thermodynamical topics, to take note only of the large con- form that is to be added, and to treat e as though it were identical with the temperature as read from a constant- temperature gas thermometer, save for the addition constant, 273.10° C. In other words, if t absolute temperature corresponding to a gas thermometer is to be taken on the scale of a gas ther- mometer, it is customary to assume that 273.10° if the thermometer is graduated Centigrade plan, or $t = T + 273.10°$, if the is according to Fahrenheit.

Dents of thermodynamics are often confused by the introduction of the term "entropy"; and while this subject re- mains, the higher mathematics for its proper place, a few words may be given to it. When a body whose state at any given point is completely defined by two independent variables, undergoes any infinitesimal but finite change on account of corresponding infinitesimal changes in the two defining vari- ables, an infinitesimal amount of heat and it is to form a differential equation of the first and second degree, which will express the quantity of heat that is absorbed; the expression taken negative, if there is rejection of heat instead of absorption. We know, from the theory of differential equations, that the equation so formed can always be multiplied by some factor (the "integrating factor") which shall cause it to become an exact differential of some function of the variables whose differentials it contains; but, so far as pure mathematics is concerned, it is impossible to say, in advance, what that integrating factor will be, or what the nature of the function may prove to be, of which the modified expression is the exact differential. By the aid of the second law of thermodynamics, however, it may be shown that the reciprocal of the absolute temperature at which the infinitesimal transformation takes place is always an integrating factor of the differential equation in question. In other words, having written the differential expression for the quantity of heat absorbed by the body, we know that we only have to divide it by the absolute temperature of the body, in order to cause it to become the exact differential of some function of the variables. The function whose existence is thus indicated is called the entropy of the body, and in the study of thermodynamics this function is a very convenient thing, because its introduction simplifies the treatment of many problems. The main difficulty that students experience in connection with this is the difficulty of assigning to "entropy" any precise physical significance. It is probably better not to try to give any physical interpretation of this sort; for it is sufficient for many purposes merely to recognize the existence of the function, the very fact of its existence sug- gesting certain mathematical transformations which are exceedingly useful. The suggestion has sometimes been made, that it may prove to be possible to devise an instrument which shall enable us to measure the value of the entropy of a body directly, just as a thermometer measures the value of a temperature. If this could be done, the imagination of the student of thermodynamics would doubtless be greatly assisted; but it does not appear that the hope of discovering an instrument of this sort is at all well founded.

In studying the thermodynamic behavior of a body, the state of which is defined by holding as many of its measurable attributes as may be necessary in order to fix the condition of the body absolutely. These measurable attributes are represented by letters, and are taken as independent variables. Then, by treating these independent variables by known mathematical methods, we can deduce certain conclusions with regard to the behavior of the body itself. Theoretically, there is no reason why the number of independent variables may not be as great as we please; but in all of the more im- portant applications of thermodynamics it is found to be sufficient to take two independent variables. In the case of a gas, for example, it is usually sufficient to take two such variables, provided the gas is in a constant adiabatic and homogeneous throughout. When the possibility of internal motions is admitted or the gas differs in composition or in other respects in its different parts, it is necessary to take more than two variables, but this will not be considered in the present article. (Gibbs, in his classical papers on the Equilibrium of Heterogeneous Substances, published in the Transactions of the Connecticut Academy of Sciences) just previous to 1880, dis-
cussed many of the problems that arise when the composition of the substance under consideration departs from uniformity and homogeneity in any respect). Some latitude is permissible as to the variables that are selected for representing the state of the gas, but for the present we shall consider the state as being thoroughly defined when we know the pressure, \( P \), that it exerts upon each unit of area of the wall of its containing vessel and also the volume, \( V \), occupied by each unit of its mass. Other attributes of the gas may indeed vary, as well as \( P \) and \( V \); but if \( P \) and \( V \) are really sufficient to define the state of the gas completely, then these other attributes that are capable of variation at the same time must all be expressible as functions of the two variables \( P \) and \( V \). The temperature of the gas is one of the most notable physical attributes which is capable of variation; and it follows that there must be a relation connecting the temperature, \( T \), with the variables \( P \) and \( V \). This equation, which is called the characteristic equation or sometimes the elastic equation, may be written, tentatively, in the general form

\[
T = \frac{kPV}{P + V}
\]

while we know that an equation of this nature must exist, we do not know the exact form of the function \( P \) for any actual substance. For gases, however, we know its approximate form, throughout certain ranges of the variables \( P \) and \( V \). Robert Boyle showed that so long as the temperature of the gas is kept constant and the gas is not too highly compressed nor too near to its point of liquefaction, the volume varies very nearly as the reciprocal of the pressure, and Charles discovered (to express it in modern language) that so long as the pressure upon the gas remains constant, the volume is nearly proportional to the absolute temperature. Taking these two laws into account, it is evident that the form of the function \( P \) must be such that, for such values of the variables \( P \) and \( V \) as prevail under the conditions in which the laws of Boyle and Charles are nearly true, we must have

\[
\frac{RT}{V} = k
\]

where \( R \), \( T \), \( V \), and \( k \) are constants. If \( a \) and \( b \) are both zero, this reduces to the form previously given, same is true if \( P \) is very large indeed if the gas is very rare), since in that effect the small constants \( a \) and \( b \) negligible. If we assign to \( T \) any constant that we please, we may, from Van der Waals equation, trace all the possible relations \( P \) and \( V \) can have, at this one.

That is, when \( a \), \( b \), and \( k \) are known, we have assigned a fixed arbitrary value to \( T \) may then select any number of values and compute the value of \( P \) that corresponds to each one of them. If we plot the value computed, by laying off horizontal distance to represent the values of \( T \), and vertical distance to represent the corresponding values of \( P \) shall obtain a series of points representing various states that the gas is capable of assuming, while \( T \) keeps its fixed value, as we make the calculated points numerous enough, we may draw through them a curve which may be taken to represent the curves of states through which the gas as the pressure is continuously varied, the temperature remains constant. Such are called "isothermals," on account of the stancy of the temperature along them, such lines, as computed for as many different values of \( T \) from Van der Waals' equation, are shown in Fig. 1. If the high (gas at \( T_0 \), the isothermal line indistinguishable in form from the coring line as computed from the elastic of Boyle and Charles. If, on the other hand, the temperature is sufficiently low, it is only when the pressure upon the gas is increased. As the pressure grows \( P \), the volume of the gas diminishes; but as the temperature remains constant, any other sort of line can be found by fixing a point \( P \) and \( T \) is reached. When this attained, any attempt to further increase pressure merely results in the coring of the gas; the pressure remains constant as indicated by the horizontal line until at \( R \), the gas is entirely in the liquid form. Further application of \( P \),
causes but a slight reduction of volume; this which is indicated by the steepness of isothermal line above B. We have here bed what actually happens when the gas impressed along the isothermal \( T_1 \); but must be noted that the plot of this is normal from Van der Waals’ equation does have a straight part, \( ADB \), but a reversed between \( A \) and \( B \), as indicated by the line. If we could actually make the gas v this dotted line, we, of course, would have to from the gaseous condition into the liquid, without any discontinuity in state; s, in such a manner that it would never tility liquid and partly gaseous, and so we should not be able to see when the transition from one state to the other took It can be shown, however, that the states g gas which correspond to the dotted of the isothermal are essentially unstable, at the attempt to make the gas follow the portion of the theoretical isothermal is trying to balance a pyramid upon its point line \( ADB \) which the gas actually follows reference to the double loop, is in such a on that the areas of the two shaded loops equate each other. As was first shown by Maxwell. A ion of the dotted loops in the immediate ty of \( A \) and \( B \) can be actually realized e laboratory, by careful experiment; but often convenient, however, to assume the existent of a gas of this sort, for the purpose of illustrating general principles, of or obtaining approximate solutions of thermodynamical problems, and the ideal (but non-existent) gas which fulfills the relation of Boyle and Charles absolutely and under all circumstances is commonly called a “perfect gas,” though “ideal gas” would appear to be a preferable name. In applying the conception of a perfect gas, it is customary to assume the further constant that when a gas of this sort changes its volume at constant temperature, the heat that it absorbs is exactly equivalent to the external work that the gas does, in expanding against the external pressure that the containing vessel exerts upon it. In other words, it is customary to assume that the perfect gas, in addition to obeying the laws of Boyle and Charles perfectly, is also so constituted that its internal energy depends upon nothing but the temperature of the gas. The characteristic equations of Van der Waals and others are decided improvements upon the equation of Boyle and Charles, and they represent, very well, the nature of the phenomena that occur in a gas in the vicinity of the critical point. None of them, for any account, however, of the fact that a body is capable of existing in the solid state, as well as in the liquid and gaseous states; and the first characteristic

Fig. 4.

instability speedily becomes too marked to the experiments being carried far, temperatures intermediate between \( T_1 \) and e isothermals have a character intermedi between those shown for those tem- eratures. As we proceed upward from \( T_1 \), ops on the isothermals grow less and less unc, as is indicated by the partial, I isothermal, and we presently arrive at particular isothermal, \( T_2 \), where the loops ease to exist. At any temperature higher \( T_2 \), it is, therefore, impossible to liqyte is by the application of any pressure what- matter how great. Hence the tempera- of \( T_2 \) is the “critical temperature” of the gas. Critical Point. There is one point on critical isothermal (marked “C” in Fig. 2), at which the isothermal is precisely horizontal and it also has a point of inflection; and this corresponds to the critical point of the its temperature being the critical tempera- ture; i.e., the critical point of the volume and its are the critical pressure.

though gases obey the characteristic equa- of Boyle and Charles very closely when are not too highly compressed and not too to condensation, there is no gas which it rigorously under all conditions. It is

equation complete enough to take the solid state into account also, has yet to be proposed.

When a body passes from one condition of pressure and density to another, it either absorbs or emits heat, unless certain special conditions are fulfilled. To avoid circumlocution, we may speak of it as always “absorbing” heat; the emission of heat being considered to be merely a case of negative absorption. Suppose, for example, that a body is in the state corresponding to \( A \), in Fig. 2; and for definiteness let us suppose that the body under consideration is a gas, although the reasoning will apply equally well to a liquid or to a homogeneous, isotropic solid. The height of \( A \) above the horizontal reference line then represents, on some convenient scale, the pressure to which each unit of the bounding surface of the gas is exposed; and the distance of \( A \) from the vertical reference line at the left corresponds, upon some other convenient scale, to the volume occupied by a unit mass of the gas. If the gas be caused to pass from the condition represented by \( A \) to that which is represented by \( B \), by passing through all the intermediate conditions that are represented by the points that are intermediate to \( A \) and \( B \) on the line \( ACB \), the gas is said to pass from the state \( A \) to the state \( B \) along
the "path" $AB$. In genera, a change of this sort will be accompanied by an absorption of heat; the heat which is absorbed being partly expended in increasing the internal energy of the gas, and partly in the performance of external work. It is a consequence of the first law of thermodynamics that the change in the internal energy of the gas is entirely independent of the shape of the path $ACB$, and depends only upon the positions of the points $A$ and $B$. That portion of the absorbed heat which goes to increase the internal energy of the gas, therefore, depends upon nothing but the positions of $A$ and $B$. The case is different, however, with that portion of the absorbed heat which is consumed in the performance of external work. Consider, for example, the state of the gas at the point $C$. The pressure upon the gas, per unit of area of the containing vessel, is represented by the vertical line $CE$; and when the volume of the gas increases by the slight amount $EF$, the external work that the gas does is represented by the product of the pressure and the increase in volume; that is, it is represented by the area of the little rectangle $CIFE$. We must regard the gas made up of an infinite number of inextensible segments, each of which is typified by the little rectangle that is shown; and hence it follows that the total quantity of external work done by the gas as it is passed from the condenser at the position $A$ to the condition $B$ along the path $ACB$, is represented by the area included between the curve $ACB$ and the straight lines $AM$, $MN$ and $NB$. Obviously this area depends upon the form of the path $ACB$; and hence the external work that is done by the gas also depends upon the form of that path, and so also does that part of the heat absorbed along $ACB$, which is consumed in performing this work.

When a gas (or other body) describes a closed path, such as is shown in Fig. 3, and returns finally to its original state, then the internal energy of the gas also returns to its original value; and the total quantity of heat that is absorbed by the gas during its passage around the path is absorbed entirely by the external work that the gas does. That is, it is represented by the area of the closed path, as shown shaded in Fig. 3. A closed path of this sort is called a "cycle," and the total quantity of heat which the gas absorbs in various kinds of work is very important in many branches of thermodynamical reasoning. If $AB$ and $DC$, in Fig. 3, represent isothermal lines, and $AP$ and $BC$ represent adiabatic lines (that is, lines along which there is no absorption or rejection of heat by the gas), then the cycle $ABCD$ is called a "Carnot cycle," because it is the kind of a cycle that Carnot imagined his ideal, reversible engine to describe. (For Carnot's principle, enunciated in the earlier part of this article.)

When a gas is heated from $T_1$ to another temperature $T_2$, the quantity of heat absorbed in the process will depend upon the precise way in which the passage from one of these temperatures to the other is effected. If we imagine $T_1$ as the initial state of the gas, and let the curved lines, $T_1$ and $T_2$, represent the isothermal lines corresponding to the temperatures $T_1$ and $T_2$. If we cause the gas to pass, as in the previous case, from the isothermal $T_1$ to the isothermal $T_2$, along the path $AB$, then we are heating the gas while its pressure remains constant, and if we cause it to pass from $T_1$ to $T_2$, the vertical line $AB$, we are heating it with temperature remaining constant. If the difference in temperature between $T_1$ and $T_2$ is one unit and the mass of the gas is assumed unity, then the quantity of heat absorbed along $AB$ is the "specific heat at constant volume," and the quantity absorbed along $AC$ is the "specific heat at constant pressure." That these two specific heats are really will be evident from the fact that the external energy of the gas in the states $A$ and $B$ are not necessarily the same, unless the gas is assumed perfect; and also from the fact (for the heat that is absorbed along the path $AC$ to be partially expended in doing the external work represented by the shaded area along the path $AB$, there is no external work done.

The fact that in an ideal reversible engine the efficiency does not depend upon the nature of the substance whose expansion does the work, is sometimes hard to the beginner in thermodynamical reasoning to understand, for the reason that objections occur to him which appear to him to be unanswerable. But an answer, however, to every objection that may be urged: One of the commonest difficulties is this: In a steam engine, water is pumped into the boiler, and is then evaporated by the expenditure of a large amount of the steam is then passed to the cylinder of the engine and expanded, after which it is condensed and reconverted into water. The quantity of heat which is expended in the water is then converted into mechanical energy by the engine, and is merely rejected into the condenser. The engines have been designed and built, in which the water that is commonly used is replaced by some other liquid (such as ether or carbon disulphide) which has a much smaller heat of vaporization; in the belief that apparently large source of loss could be avoided by such engines have invariably proved less successful. Pointing any trifling superiority that have been shown from time to time being attributed to other causes than the smaller latent heat of vaporization of the working fluid. This for this is, that there is an intimate relationship between the pressure of a saturated vapor, given temperature, and the latent heat of vaporization of the liquid. This relation is known as the "second thermodynamic relation," and the "Clapeyron's equation." The elucidation of this matter requires a brief introduction of the infinitesimal calculus, and refers to the standard of the work of Clausius, and of the practical work that has been done since the Carnot engine has probably been inspired by the existence of the Carnot of the second thermodynamic relation. See Heaviside's "Theory of Heat," and of "Gas, Kinetic Theory," and of other similar articles in this volume.

THERMO-ELECTRICITY

If an electrical circuit is constructed partly of one metal and partly of another, and one of the points of junction between the dissimilar metals is heated while the other is kept cool, a current of electricity will be caused to flow in the circuit. This fundamental fact was discovered by Seebeck in 1821. The electricity thus generated is not in anywise different from that which is generated by an ordinary galvanic battery; but on account of its mode of production it is called "thermo-electric." The electromotive force that is set up in a circuit under the circumstances here described is always quite small, and its intensity depends (1) upon the nature of the two metals which are brought together (2) upon the difference in temperature between the two junctions where the dissimilar metals come together and (3) upon the average temperature of these junctions. For the sake of definiteness, let the two metals of which the circuit is composed be designated by the letters X and Y. The phenomena of thermo-electricity may then be described in the following mathematical language: It is known from experiment that when two metals X and Y are brought together so that their point of contact has the temperature T, an electromotive force exists between the two, which tends to send a current (say) from X into Y; and it is also known that the magnitude of this electromotive force can be expressed as a parabolic function of the temperature, T. Thus if E is the electromotive force in question, the facts of experiment can be adequately expressed by a relation of the form \( E = a + bT + cT^2 \); where a, b, and c are constants whose values depend upon the nature of the metals X and Y. In the actual circuit there are necessarily two junctions across which electromotive forces of this character exist. Let the temperatures of these junctions be respectively \( T_1 \) and \( T_2 \). Then the foregoing formula shows that across the junction whose temperature is \( T_1 \) there is an electromotive force of intensity \( E_1 = a + bT_1 + cT_1^2 \), tending to send a current from X into Y; and across the junction whose temperature is \( T_2 \) there is a similar electromotive force of intensity \( E_2 = a + bT_2 + cT_2^2 \), also tending to send a current from X into Y. These electromotive forces being opposed to each other, so far as the production of a current around the circuit is concerned, the effective electromotive force around the circuit is the difference between \( E_1 \) and \( E_2 \); and if we denote this effective electromotive force by the letter \( F \), we have

\[
F = E_2 - E_1 = b (T_2 - T_1) + c(T_1^2 - T_2^2),
\]

or

\[
F = (T_2 - T_1) [b + c(T_1 + T_2)].
\]

From this last equation it is evident that so long as the average temperature of the two junctions is constant (or, in other words, so long as \( T_1 + T_2 \) is constant), the electromotive force will be proportional to the difference in temperature between the two junctions. But it is also evident that when the average temperature of the two junctions is such that the relation

\[
b + c(T_1 + T_2) = 0
\]

is fulfilled (or, in other words, when the average temperature of the two junctions is numerically equal to \(-b/2c\)), there will be no thermo-electromotive force in the circuit (and, therefore, no current), no matter what the difference in temperature between the two junctions may be. This average temperature, for which there is no thermo-electric effect in a circuit, has a definite value for every pair of metals, and is known as the "neutral temperature" for that pair. The values of the constants \( b \) and \( c \), in the foregoing formula, could be determined experimentally, and recorded in tabular form for various pairs of metals. It is usual, however, to record the experimental data in a somewhat different manner, as we proceed to explain. If the average temperature \( T \) of the two metals be denoted by \( T_a \), then the formula for the effective electromotive force, \( F \), may be written

\[
F = (T_a - T) [b + cT_a].
\]

The constants \( b \) and \( c \) refer, it will be understood, to a particular pair of metals; but it is found that their values can be satisfactorily represented as the differences between constants which can be stated for the two metals separately. Thus \( b \) can be expressed in the form \( b = B' - B'' \) and \( 2c \) can be expressed in the form \( 2c = C' - C'' \); \( B' \) and \( C' \) being constants whose values depend solely upon the metal X, and \( B'' \) and \( C'' \) being constants whose values depend, in a similar manner, solely upon the metal Y. The expression for the effective electromotive force \( F \) can, therefore, be written thus:

\[
F = (T_a - T) [(B' - B'') + (C' - C'') T_a].
\]

The values of the constants \( B \) and \( C \) for the different metals vary somewhat with the physical conditions of the metals; but the data given in the accompanying table, in which the general nature of these constants, and will also suffice to represent, with some degree of approximation, the actual magnitude of the thermo-electric effects that may be expected from circuits composed of the metals there represented. In applying this table, temperatures are supposed to be expressed on the ordinary Centigrade scale, which defines the freezing point of water to be 0°, and the boiling point to be 100°; and the results are expressed in hundred-millionths of a volt, so that to reduce them to volts it is necessary to divide them by 100,000,000.

To illustrate the use of this table, let us compute the electromotive force of a circuit composed of iron and copper, when one of the junctions is kept at 0°C, and the other at 100°C. For iron we have \( B = +1734 \) and \( C = -4.87 \); and for copper we have \( B = +136 \) and \( C = +0.95 \). Hence we see that for this pair of metals \( b = +1734 - 136 = 1598 \), and \( 2c = 4.87 - 0.95 = 3.92 \). The thermo-electromotive force in the circuit is therefore,

\[
F = (1598 - 5.827 T_a).
\]

But we have assumed that \( T_a = 100° \) and \( T_a = \)
THERMO-ELECTRICITY

0°; hence \( T_1 - T = 100 \) and \( T = 50\)°, and we have \( F = 100(1598 - 5.82 \times 50) = 130,700 \). Dividing this by 100,000, we get \( F = 130.7 \), and the final conclusion is, that a thermo-electric couple of the kind described will give an electromotive force of about 0.000131 of a volt (in round numbers). To find the *neutral point* of an iron-copper couple, we merely have to set the expression \( 1598 - 5.82T \) to zero, and solve the equation for \( T \). Proceeding in this manner, we find that the desired neutral temperature is 274° C.

Nickel is not included in the foregoing table, because its behavior is anomalous. From -18° C. to 175° C., its constants are \( B = -2204 \) and \( C = -5.12 \); but a short distance above 175° C. its values change profoundly, so that between 250° C. and 310° C., we have \( B = -8449 \) and \( C = +24.1 \). Above 340° C. we have, for this metal, the values \( B = -307 \) and \( C = -5.12 \). Antimony and bismuth are commonly used as the two metals in experimental thermo-electric circuits, since they yield an electromotive force which is larger than is obtainable under similar conditions by other metallic pairs. The thermo-electric constants of antimony and bismuth do not appear to have been determined with precision, however. When the average temperature of the two junctions (\( T \)) is about 20° C., the values of \( B + CT \) are approximately as follows: Bismuth, pressed commercial wire, -9700; bismuth, pure pressed wire, -8900; bismuth crystal, axially, -6500; bismuth crystal, equatorially, -4500. Antimony, pressed commercial wire, +600; antimony, pure pressed wire, +280; antimony crystal, axially, +2260; antimony crystal, equatorially, +2640.

When a thermo-electric couple is generating an electrical current, heat is absorbed at the hot junction, and given out at the cold one. If an electric current is caused to flow across the junction of any two dissimilar metals, heat is either evolved or absorbed at the junction; and if an evolution of heat is observed when the current flows across from the metal \( X \) to the metal \( Y \), there will be an absorption of heat when the current is made to flow from \( Y \) to \( X \). This phenomenon, which was discovered by Peltier, is known as the *Peltier effect.* Lord Kelvin showed that in the thermo-electric circuit the reversible heat effects are not confined to the junctions themselves. He showed, in fact, that when an electrical current is caused to flow through a wire that is locally heated by a gas flame or otherwise, the current tends to cause a displacement, along the length of the wire, of the point of maximum temperature. The effect may be illustrated by thinking of the wire as a tube conveying a stream of some real fluid; the fluid taking up more or less of the heat, and carrying it along in such a way as to shift the point at which the temperature is greatest. The analogy is imperfect, however, because in the case of electricity the heat travels with the current in some metals, and against it in others. This phenomenon (which is known as the *Thomson effect*) has an important bearing upon the theory of thermoelectricity, because in a thermo-electrical circuit the temperature is necessarily variable from point to point, and, therefore, the *Thomson effect* may (and in fact does) modify the phenomena considerably. The effect is zero in lead, but in nearly every conductor it is quite sensible. The consequences of the *Thomson effect* are discussed in two papers in the first volume of Lord Kelvin's 'Mathematical and Physical Papers.'

When a circuit contains several thermo-electric couples, with their successive junctions alternately heated and cooled, the total electromotive force that is produced is sensibly equal to the sum of all the electromotive forces that the several couples would produce, if each existed separately. Advantage is taken of this fact in the instrument known as the *thermo-pile,* which consists of a series of small bars of antimony and bismuth (often about 25 pairs altogether), disposed side by side so as to form an approximate cube and insulated from one another by strips of paper or other non-conductor. These bars are soldered together at the ends so that a current, in order to traverse the system, must pass back and forth through alternate bars of bismuth and of antimony; the passage of the current from bismuth into antimony being always effected at the right hand end of the little pile of bars, while the passage from antimony into bismuth is always effected at the left hand end. The two free ends of the thermo-pile being connected by a wire, a current of electricity flows through the circuit so formed, when either of the surfaces containing the soldered junctions is warmed, while the opposite one is kept cool. This instrument is used to a considerable extent for the determination of the approximate estimation of radiant heat; the current that it produces and which is measured by a delicate galvanometer in the external part of the circuit being taken as the index of the amount of the radiation. (Consult Tyndall, 'Contributions to Molecular Physics in the Domain of Radiant Heat'). The thermo-pile was invented by Nohili, but it was so greatly improved by Melloni that it is commonly credited to him.

Many attempts have been made to construct a thermo-electric combination that would yield a current of electricity intense enough to be of commercial utility; but while such attempts have been partially successful, there is no great reason to suppose that any new generators will ever be of much practical value. The difficulties are partly structural and partly theoretical. In order to realize any considerable electromotive force, the number of elements must be large; and the experience hitherto...
that a complicated thermo-pile is not very durable. Even if this objection overcome, there remains the serious there are theoretical reasons, based on the apparent changes in the temperature of the thermo-pile, as an instrument converting heat energy into electricity, can never be high. In a particular case, it was investigated by Lord Rayleigh, that a perfectly efficient detector of thermal energy is the thermo-pile that is not likely that an instrument of this kind would be of greater utility than this will ever be attained with a thermo-pile that is not likely to have a material value. A. D. RISTEEN, F. M. THERMOGRAPH (Greek, "heat-writing"), or self-registering thermometer, which an automatic record of varia- temperature is kept. Many different thermo-graphs have been made, of which wing may be especially noted: (1) the phic thermographs, in which the posi- mercury thread in an ordinary thermo- is photographed upon a moving sen- a, either continuously or at short in- f time; the moving sensitive film be- tered by clockwork, so that the time any given impression was made can be determined. (2) Metallic-strip thermo- which a recording pen is actuated by a metal composed of two substances differing in expansibility, riveted or soldered. When a strip of this kind is heated, it expands more than the other, its strip becomes curved, which serves as a measure of its temperature. The pen which makes the record on a disc of paper which is slowly revolved at a steady rate by means of a clockwork. (3) Electric-contact thermostats, in which a fine platinum wire is caused to touch, at intervals, into the open upper capillary tube of a sensitive mercury thermometer. When the wire touches the column, it completes an electrical cir- cuit, and the means the position of the thread in the thermometer is recorded. A manometric thermograph, in which the in a closed vessel filled with a gas is the index of the temperature; the being recorded automatically, and the ure being afterward inferred from the pressure, by means of a theoretical or else by direct comparison of the in- at different temperatures, with a thermometer. The pressure of an at the pressure of gas of this kind is known to be proportional to the absolute tem- of the gas, so long as the volume is tant). THERMOMETER (Greek "heat-meas- uses; e, heading Thermometry; and the racters of the common mercury-in-glass thermometer, which are certain of its uses. The mercury-in-glass thermom-
to do this the bulb is heated until the air that it contains is partially expelled and the open end of the stem is then dipped beneath the mercury. As the bulb cools, the air remaining within it contracts, and the stem is slowly filled until the bulb has become partially filled; this operation being repeated until the bulb is full. The instrument is next heated to a temperature considerably higher than the highest temperature it is to be exposed to in use, so that the mercury that contains becomes thereby so much expanded that it fills the entire stem and runs over at the top; and while the stem is still full in this manner it is sealed off at the end by means of a blowpipe. In the higher grades of thermometers, a tiny pear-shaped bulb is left at the top of the stem, partly as a precaution against the destruction of the thermometer in case it is accidentally exposed to too high a temperature in its subsequent service and partly as a aid in the calibration of the stem. When such a pear-shaped bulb is provided, the stem may be sealed off at the end while the internal space is exhausted by means of an air pump, instead of while it is filled with mercury; or it may be filled, above the mercury column, with dry nitrogen or some other inert gas. The glass part of the instrument having been completed, it remains to affix the scale to the stem. In high grade thermometers, the scale is engraved upon the stem directly; but in the cheaper forms it is usually engraved or stamped upon a piece of metal or of wood, to which the thermometer is finally secured. Let us consider the high grade instruments first and the cheaper ones afterward. Instruments of the former class are graduated by finding, experimentally, two definite points upon the stem, corresponding to two known temperatures; the two known temperatures which are selected for this purpose being the boiling point and freezing point of water. When these two points are found, the space between them is divided into a certain number of equal parts, which are called degrees. In determining the position of these points on a thermometer, the instrument is placed in a steam that is rising from water that is boiling freely under a barometric pressure equal to that which would be produced by a column of pure, ice-cold mercury, 760 millimeters high, at sea-level in latitude 45°. When the mercury column in the thermometer ceases rising and becomes stationary, the point opposite which it stands is marked upon the stem and is called the “boiling point.” If the barometric pressure under which the experiment is performed is not identically equal to the value assumed above, allowance must be made for that fact by the aid of the experiments of Regnault (or others) upon the variation of the boiling point of water per millimeter of elevation of the boiling point. The boiling point having been marked upon the thermometer as here indicated, the instrument is then placed in a mixture of water and tarry pulverized ice, as quickly as this can be safely done; and the point in which the mercury sinks is marked and called the “freezing point.” The distance, on the stem, between the boiling and freezing points, is then marked off, by means of a divide engine, into as many equal spaces as there are degrees between the freezing and boiling points of water (leaving for the filling of numbers to the degree-marks) the thermometer is complete. It may be of use that the thermometer is to be divided into degrees, or into tenths; but the operation is precisely the same, in this case, as if the division included the stem itself.

We could evidently divide the space between the boiling point and the freezing point into many equal “degrees” as we chose; for no reason, in the nature of things, a “degree” could not have any one size, just as any other size. It is done according to the manufacturers of thermometers and manufacturers of standards, but, in general, there has been some uniform practice in this respect; hence the manufacturers of thermometers have consistently conformed to one or the other of the standard systems. In France, and also in the United States and in England, it is customary to follow the plan introduced in 1744 by Fahrenheit and fixed by the French Academy about 1714. In this system the standard of temperature is divided into 180 equal spaces, or “degrees”; but the freezing point is here called 0°, and the boiling 100° (32° + 176° = 212°). There has been much discussion as to the reason that a temperature of 0° had for dividing the fundamental interval between two fixed points into 100 equal parts, the freezing point being called “zero,” or 0°, and the boiling point 100°. This method of graduation is known as the “Centigrade” (or “centesimal”) system. For general purposes in the United States and in England, it is customary for graduate thermometers to divide the temperature scale into 180 equal spaces, or “degrees”; but the freezing point is here called 32°, and the boiling point 212° (32° + 176° = 212°). This method of graduation is extensively used in Germany upon thermometers intended for household purposes; but for most other purposes in that country it has given way to the Centigrade system. After a thermometer that is to be used for precise measurement has been made and graduated, it is subjected to certain experiments, for the purpose of ascertaining the errors to which it may be liable. One of the most important of these is the “calibration,” or “calibration error,” which is due to irregularities of calibre as the bore of the tube may possess. In order to determine the calibration errors, a thread of mercury of equal length is detached temporarily from the bulb in the stem, by shaking the instrument, and the detached thread is brought into various positions, and in certain of these positions its length is measured. The difference between the measured length and the length of the thread before it was detached is the calibration error.

ult in an apparent variation in the po-
 sition of the "zero point" of the thermometer,
 which is very troublesome when measurements
 of the highest precision are to be made. It is
 on account of this anomalous variation in the
 position of the zero point that the three kinds
 of glass mentioned in the earlier part of this
 article are recommended for the manufacture
 of the bulb; the variation of the zero having
 been studied in the case of these species of
 glass with great care. The phenomena as ob-
 served in the case of "verre dur" are thus
 described by Guillaume: "When a verre dur
 thermometer is quickly exposed to a tempera-
 ture of 100° C, after having exposed for a con-
 siderable time at the ordinary temperature of
 the laboratory, its zero point falls with such
 rapidity that after an exposure of one minute
 at 100° C, the displacement is practically com-
 plete. If the thermometer is then placed in
 ice-water, its zero ascends, for the first few
 moments, at the rate of about 0.001° C. per
 minute; but this rate diminishes rapidly. When
 a thermometer is maintained at a constant
 temperature, its zero point rises little by little
 and the change can be traced plainly for se-
 veral years. For thermometers of verre dur, the
 gradual rise at constant temperature amounts
 to about 0.001° C. per month when the ther-
 meter is two years old, and at the end of four
 or five years the motion is found to have
 diminished to about 0.0002° C. per annum." The
 ideal way of measuring a temperature, with a
 thermometer made of one of the three
glasses mentioned above, is as follows: The
 thermometer is exposed to the temperature that
 it is to be measured, and its zero points to a
 certain (presumably unknown) position. Af-
 ter the instrument has been read, it is intro-
duced, as quickly as is consistent with its
 safety, into a mixture of water and pulverized
 ice. The mercury sinks at once and soon at-
tains a stable position, which, on account of
 the slowness of the change of zero with
 falling temperature, is taken to be the zero
 corresponding to the higher temperature to
 which the instrument has been previously ex-
posed. In accordance with this plan, the
 temperature to be measured is found by sub-
 tracting the subsequent reading in ice-water
 from the reading obtained at the temperature
to be determined. The method here outlined,
 for eliminating the effect of variations in
 the zero point of a thermometer, is known as
 the "method of movable zeros," and is now
 adopted at practically all of the centres of ac-
curate thermometry except Kew, for tempera-
tures between the freezing and boiling points.
 It is not yet possible, by any method of pro-
 cedure, to determine temperatures more than a
 few degrees below the freezing point, or more
 than a hundred degrees (Centigrade) above
 the boiling point, by the aid of a mercury-in-glass
 thermometer, with a precision comparable with
 that which is attainable within the fundamental
 interval that lies between 0° C. and 100° C.
 It is to be understood that in the foregoing
 discussion of the errors of the mercury-in-glass
 thermometer, we have been treating of the de-
termination of temperatures to such a degree of
 precision that the final error is not to exceed
 (say) 0.005° C. No such elaborate care is re-
 quired, if the only object of the measurement is
to determine the temperature to the nearest degree, or half-degree.

Passing now to the consideration of the ordinary thermometers that are used about the household and by amateur meteorological observers, it may be pointed out, first, that in the manufacture of a thermometer that is to be sold at retail for (say) 50 cents, it is not commercially possible to engrave a special scale for each instrument. In making cheap thermometers it is customary to stamp for the scales in large numbers and then to blow the bulb of each instrument to such a size that the scale will be as nearly as practicable adapted to the finished thermometer. This can be done, by an experienced glass-worker, with greater accuracy than might be supposed; but it is evident that no high degree of precision can be attained in this way. The scale and the rest of the thermometer being adapted to each other as nearly as is commercially practicable, the thermometer is adjusted with respect to the scale by exposing it to some known temperature (say 70° F.) in the vicinity of the temperatures at which it is most likely to be used and then securing it in such a position that the point on the stem to which the mercury rises comes opposite the proper mark on the scale. Such a thermometer will give readings that are not greatly in error at temperatures near the one at which it is standardized; but at other temperatures any two such thermometers will necessarily diverge by an amount which depends upon the judgment and skill of the workmen who blew the bulbs and who endeavored to give them capacities adapted to the sizes of the degrees upon their respective graduated scales.

For further information concerning the methods that are used in precise thermometry consult Guillaume, "Thermometric de Precision"; and for the historical aspect of the subject consult H. Carrington Bolton, "Evolution of the Thermometer." Consult also, Preston, "Theory of Heat."

Gas Thermometer.—A thermometer in which the temperature is measured by the change of volume, or pressure, of a mass of gas enclosed in a glass envelope. The gases that are used for this purpose are air, hydrogen and nitrogen; and thermometers containing these several gases are respectively called "air thermometers," "hydrogen thermometers," and "nitrogen thermometers.""  

Alcohol Thermometer.—A thermometer in which the temperature is indicated by the expansion of alcohol (instead of mercury): coloring matter of some kind being dissolved in the alcohol, so that the column of fluid in the stem of the instrument may be distinctly visible. Alcohol has a larger coefficient of expansion than mercury, and hence, for the same sizes of bulb and stem, the degrees are lower upon a thermometer containing it. Alcohol can also be used at temperatures that are low enough to do so; it may be the thermometer, to the freezing point of the mercury. No great degree of precision can be attained with the alcohol thermometer, however, partly because the liquid wets the glass and thereby cause the instrument to read too low when the temperature is falling, and partly for other reasons. For the measurement of temperatures approaching the freezing point of mercury (37.8° F. below zero) the International Bureau of Weights and Measures prefers a thermometer filled with toluene that is filled with alcohol; the toluene thermometer being apparently capable of much more accurate results. Owing to the fact that alcohol boils at a much lower temperature than water, the alcohol thermometer cannot be graduated by the method given for the mercury instrument, since exposure to a temperature of 212° F. would cause the alcohol to have a vapor pressure so high that the bulb would be likely to burst. These thermometers, therefore, graduated, most commonly, direct comparison with a standard mercury-glass instrument. The expansion of alcohol by heat is not strictly proportional to that of mercury and hence if the scale of the mercury thermometer is taken as the standard, the degree marks upon the alcohol thermometers not be spaced at uniform intervals; the spaces are in fact smaller at low temperatures than at higher ones, as will be seen by examining any good alcohol thermometer that is adapted for observing a considerable range of temperature.

Maximum and Minimum Thermometers are thermometers which automatically register the highest or lowest temperatures to which they have been exposed during a given period. In the Rutherford maximum thermometer the capillary stem of the thermometer is horizontal and as the mercury rises it leaves before it a tiny index of iron or steel, within the tube; and the index, being left in its most extreme position attained by the mercury, indicates the highest temperature to which the instrument has been exposed. In the Rutherford minimum thermometer a similar index is used, but the thermometric column is heaped up with alcohol and the index lies within it. When the temperature falls, the end of the column of alcohol in the stem rises; and its position is indicated by the index remaining in the alcohol. But when the temperature rises again, the alcohol flows around the little index (which does not fill the capillary tube), and so holds it in the position to which it had been driven by the rise of temperature, and which is the lowest. In both forms of thermometer the index is returned to a suitable position for a new observation by the aid of a small hook. In the Negretti and Zambra maximum thermometer the capillary tube is partially filled with alcohol so that when the mercury flows outward readily enough as the temperature rises, a fall of temperature at the moment causes the mercury thread in the bulb to break at the obstruction, so that the mercury column, having been exposed can be read in the usual manner. The broken thread can be returned to the partially empty bulb by means of the instrument, or by whirling it in a circle.

Clinical Thermometer.—A form of alcohol thermometer in which is used by physicians for determining the temperature of the human body.

The graduation on these instruments is such that the temperature can be read to a degree or so; and the entire instrument.
THERMOMETER

The graduation rarely extends below 0 or above 115°F, the normal temperature of the body being about 98°F. In using the instrument, the bulb is placed under the patient's tongue or in the arm-pit.

Differential Thermometer.—A form of thermometer designed to indicate the intensity of radiant heat. The solar radiation consists of a thermometer with a bulb, the stem being sealed into a heated sphere of glass, so that the blackened bulb comes in the centre of the sphere. Sunlight is allowed to fall upon this thermometer and also upon a similar one with a silvered and polished black absorber most of the radiant heat, while the red one reflects most of it. The difference in the readings of the two instruments is used to indicate the intensity of the radiative energy falling upon them.

Setting Thermometer.—A form of thermometer with a constriction in the bulb that is used to determine the temperature of a liquid contained in it. The temperature is recorded by means of a clock, which is arranged to stop when a bulb has cooled to a certain temperature that is lower than the one being recorded.

p-Sea Thermometer.—An instrument of the setting type, for observing temperature at various depths in the sea. It is used in a very strong case and is reversed at which the temperature is determined at moderate depths the reversal is by sending a weight down along the wire; but at greater depths the upper mechanism is usually actuated by a smaller weight which is arranged so as to begin its ascent when the thermometer starts on its way to the surface of the sea.

istering Thermometer.—Any thermometer which automatically records its own readings.

Point Thermometer.—A thermometer to the determination of the temperature of a liquid, which will be deposited from the saturated vapor of the instrument. This consists of a thin receptacle of polished silver, shaped like a drop of water. A meter is placed in each of these, and the tubes are then partially filled with ether. This volatile liquid is then cooled in a cold bath. A current of air passes through the ether by means of a stirrer, and the rapid evaporation cools the lid and its contents (including the thermometer), and the observation consists in noting the temperature of the ether, when the exterior of the silver tube containing the silvered tube of the thermometer is cooled, the tin and tube of silver, which is not cooled, is noted by observation in the room. The observation consists in noting the temperature of the ether at the time the experiment is made. The temperature of the mercury is compared with a standard temperature, and the temperature of the ether is given in degrees.

Differential Thermometer.—An instrument for measuring or detecting differences of temperature, with reference to the absolute value of the temperatures that are compared. Sir John Leslie's form, as improved by Rumford, consists of a horizontal tube, turned upward at the two ends, and there provided with a pair of equal bulbs of considerable size. The bulbs are filled with air, and a small quantity of colored liquid is placed in the horizontal tube which joins them; the liquid serving to separate the air masses that the bulbs contain, and also as an index for reading the instrument. So long as the temperatures of the two bulbs remain equal, the pressure of the air will be the same in each, and the liquid index will not move. If one of the bulbs is warmed slightly more than the other one, however, the air that contains expands and forces the liquid index toward the cooler bulb; the amount of this displacement indicating the difference in the temperatures of the bulbs. This form of differential thermometer is not used to any great extent at the present time, the thermo-pile (see Thermo-electricity) and the platinum resistance thermometer (see Thermometry) having almost entirely displaced it.

Wet Bulb Thermometer.—A thermometer whose bulb is covered with thin wet muslin, and which is used for determining the amount of moisture in the air. In practice, the wet bulb thermometer is used in connection with a similar thermometer having a dry bulb, the two being whirled through the air together, or having a current of air directed upon them by a fan, or otherwise. The evaporation of the moisture about the wet bulb causes the instrument to become cooler than the other one; and the difference in the readings of the two thermometers, when taken in connection with the reading of the wet dry one, enables the observer to determine the degree of saturation of the air at the time the experiment is made. Tables for this purpose are published by the Weather Bureau.

Weight Thermometer.—A thermometer consisting of a bulb provided with a capillary outlet in the place of the usual stem. In this instrument, the bulb is first weighed while empty, and again when filled with ice-cold mercury. It is next heated to the boiling point of water, and the mercury which escapes is collected and weighed. These data enable the observer to calculate the fraction of the original weight of ice-cold mercury that is lost upon heating the bulb to the boiling point. To determine any other temperature, he fills the bulb, as before, with ice-cold mercury, and then exposes it to the temperature that is to be measured (this temperature being assumed to be higher than the freezing point of water). Collecting the mercury that runs out of the bulb, and expressing its weight as a fraction of the weight of ice-cold mercury that was present at the outset, he has only to compare the fraction so obtained with the fraction obtained in the first experiment, in order to be able to calculate, by a simple proportion, the temperature desired. The weight thermometer is a convenient instrument to use, but it is simple in theory, and is free from certain of the errors to which ordinary thermometers are liable.

Metallic Thermometer.—A instrument in which temperature is determined by noting the change of form or of length that a metallic
THERMOMETRIC ANALYSIS—THERMOMETRY

strip experiences when it is heated. In Bréguet's instrument, three thin strips composed respectively of platinum, gold and silver are rolled together into the form of a single ribbon, the gold being in the centre. The ribbon is then coiled into a spiral, with the silver at the end that is to be kept at a constant temperature, while the other end is exposed to the temperature that is to be measured. Of these four general methods, the first two have been longest and most commonly employed; and the particular instruments that have been most extensively used for putting them into practice are known respectively as the "mercury-in-glass thermometer" and as the "gas thermometer." The mercury-in-glass instrument is described under Thermometry, and the gas thermometer is described in the present article, below.

The gas thermometer was probably the first form of thermometer to be constructed. The mercury-in-glass instrument followed, and for many years was used almost exclusively for the measurement of temperatures, double and single, on account of its simplicity and the ease with which it can be used. But as the science of thermometry developed, and increasing refinement in temperature determinations was demanded, it was found that the mercury-in-glass thermometer is liable to serious errors on account of anomalous expansions and contractions of the glass envelope; errors which were of little or no importance when a determination of temperature to the nearest quarter of a degree or so was considered sufficiently accurate, but which were of paramount importance when it was proposed to determine a temperature to the hundredth or thousandth of a degree. The errors due to the cause in question can now be eliminated in large measure by making temperature determinations by the "movable zero" method (see Thermometer); but physicists nevertheless prefer to follow the lead of Regnault, who, in his celebrated "Fourth Memoir" (1847), recommended the employment of the gas thermometer as the standard for the establishment of the temperature scale; and the gas thermometer is still the standard in all work of high precision. The great advantage of the gas thermometer consists in the fact that the coefficients of expansion of gases are much more accurately known than those of mercury, and the effects of anomalous changes of size in the glass bulb are of correspondingly less importance.

The gas thermometer is made in two general forms, according as it is desired to measure the temperature by the expansion of the gas at some constant pressure, or by the increase in the pressure of the gas at some constant volume. The latter plan being the one that is now by far the commoner in accurate work, we shall describe it first, and at some length.

The constant-volume gas thermometer is shown, in its essential features, in the accompanying illustration. It consists of a bulb, A, of considerable size, which is connected, by means of a capillary tube, with a mercury manometer, M. At a is a mark upon the tube leading to the gas bulb, and care is taken, whenever an observation of any kind is made, to have the level of the mercury in the short arm of the manometer exactly at the same level. The volume of the thermometric gas may always be rigorously the same. A movable reservoir of mercury, V, is connected with the bulb A for this purpose, by means of a flexible tube; so that by raising or lowering V the mercury
The volume of the gas in the bulb remains constant. If \( T \) be the temperature as thus defined, and \( P \) is the pressure prevailing within the bulb \( A \), then we have, from the definition of temperature, \( T = CP \), where \( C \) is a constant for the particular thermometer in operation. (It is to be observed that \( P \) is the total pressure to which the gas in \( A \) is subjected. It includes not only the pressure that is read from the manometer \( M \), but also that barometric pressure that prevails at the same time in the air of the laboratory; for this barometric pressure acts upon the top of the mercury column, and it is, therefore, to be added to the reading of the manometer \( M \).) To deduce the value of the constant \( C \), we may subject the bulb \( A \) successively to the steam from boiling water, and to a mixture of ice and water, as described under Thermometer. The total pressure upon the gas in the bulb being noted in each case, let us suppose that it is \( P_0 \) at the freezing point, and \( P_{100} \) at the boiling point. Then the foregoing equation, when applied to these two cases, takes the following forms, respectively: \( T_0 = CP_0 \), \( T_{100} = CP_{100} \); \( T_0 \) being the temperature of the freezing point according to the scale of this thermometer, and \( T_{100} \) being that of the boiling point. We may define \( T_0 \) or \( T_{100} \) however we please, and then find the corresponding value of \( C \); but it is desirable that the scale of the gas thermometer shall be as closely as possible like that of the ordinary mercury-in-glass instrument; and in order to fulfil this condition it is found to be best to subject the gas thermometer scale to the condition that the difference between \( T_0 \) and \( T_{100} \) as determined by the gas thermometer, shall be numerically the same as the difference between the freezing and boiling points, on the ordinary mercury-in-glass scale. In other words, it is found to be best to have the average size of the degrees the same on the two instruments. In scientific work the Centigrade scale is used in practically every instance; and if we adopt it here, we shall have the relation \( T_{100} - T_0 = 100^\circ \), if the condition just mentioned is to be fulfilled. From this and the preceding equations we easily find that \( C(P_{100} - P_0) = 100^\circ \), or \( C = \frac{100}{(P_{100} - P_0)} \); so that when we know the values of \( P_{100} \) and \( P_0 \) by direct observation, we are prepared to determine \( C \) at once, and hence to calculate the gas-temperature, \( T \), corresponding to any given pressure \( P_0 \), by means of the relation \( T = CP \). It will be seen that the zero of the gas thermometer scale does not coincide with the freezing point of water, but that it is very much lower. The gas thermometer could not give \( T = 0 \), for example, unless \( P = 0 \); that is, not unless the temperature was so low as to cause the gaseous pressure to disappear altogether. The zero point from which the indications of the gas thermometer are counted, according to the formula given above, is called the "natural zero" of the instrument; and in order to be able to compare the gas scale with the scale of the ordinary mercury-in-glass thermometer, it becomes necessary to know what the temperature of freezing water is, as read from the gas scale. To determine this, we make use of the relation \( T_0 = CP_0 \). Substituting \( T_0 \) in the value of \( C \) as already found, we find that \( T_0 = 100P_0 \). Now the quantity \( (P_{100} - P_0)/P_0 \) is known as the "coefficient of expansion at constant volume" for the gas. (The name is somewhat absurd, it is true, be-
cause there is no expansion at all, if there is no change of volume; and it would be more accurate to designate this fraction as the "coefficient of increase of pressure" at constant volume. It appears, therefore, that the temperature of melting ice on the scale of the constant-volume gas thermometer, is numerically equal to 100 times the reciprocal of the coefficient of expansion of the gas at constant volume. Having found \( T_g \), we have only to subtract it from every reading of the gas thermometer, in order to reduce that reading to its corresponding value as reckoned from the freezing point of water. If we call the values of \( T - T_g \) as computed for any given gas thermometer, the "reduced readings" of that thermometer, then we find that the reduced readings of the nitrogen, hydrogen, air and carbon dioxide constant-volume thermometers are all nearly identical, and that they are all closely comparable with the readings of the ordinary mercury-in-glass thermometer. All two constant-volume gas thermometers be filled with the same gas in different states of density, then the reduced readings of the two are very nearly equal, but yet not necessarily identical.

The coefficients of expansion at constant volume of certain of the more important thermometric gases are given in Table 1, as deduced from a careful analysis of the data given by Chappuis, Regnault and numerous other experimenters of high standing. The "initial pressure" signifies the pressure on the gas in the thermometric bulb, when the bulb is surrounded by ice and water; this pressure being given as the most convenient way of fixing the density for which the coefficients were determined. Two coefficients are given for air at each initial pressure, because it appears to be

impossible to decide, from the observations thus far made, which one of these values is most likely to be correct, the available measures falling into two general groups, one of which favors one of the two values, while the other favors the other one. In Table 1 the values of \( T_g \) are also given, for convenience of reference.

The International Committee of Weights and Measures, in consideration of the difference that exists between the reduced reading of constant-volume gas thermometers, adopted the following scale for the measurement of temperature, calling it then "International temperature." The scale adopted is the Centigrade scale of the constant-volume gas thermometer, in which the hydrogen has a density, such that its pressure, at the freezing point of water, is to that due to a column of ice-cold one metre (1,000 mm.) high. The units are understood to be "reduced," as described above, so that the thermometer "0" at the freezing point is 100\(^\circ\) at the scale point. The ideal scale would of course be absolute thermodynamic scale (see Thermodynamics); but the corrections that are made in order to reduce gas thermometer readings to this scale are still too uncertain to be adopted in precise thermometry.

2. Comparison of Readings of Constant Volume Gas Thermometers and the Curie-Verrier-Dub Scale ("Reduced" Thermometers).

In Table 2 comparative readings are of the mercury-in-glass ("Verrier Thermer"), scale, and the scales of constant-volume hydrogen, nitrogen and carbon dioxide thermometers, in which the "initial pressures" are 1,000 millimetres of mercury. The significance of the table will be made plain in the following example: If all of the thermometers were exposed to a temperature which the "reduced" reading of the instrument was 30\(^\circ\) C, then the nitrogen thermometer would read 30001\(^\circ\) C, the carbon dioxide thermometer would read 30034\(^\circ\) C, and the mercury-in-glass thermometer would read 30031\(^\circ\) C. Readings given in the second column were taken from experiments made upon a constant-volume mercury thermometer; but Chappuis stated that reduced readings of the air thermometer of the nitrogen thermometer are practically indistinguishable; and hence this column serve for each of them.

In the constant-pressure gas thermometer, temperature is defined as proportional to volume of a fixed mass of gas which expands in such a manner that the pressure remains constant. Regnault experimented with thermometers of this class, and considered them to be distinctly inferior in accuracy to the others, which have already described. This is now admitted by Regnault has met with nearly every subsequent authority in experimental physics, and hence the constant-pressure gas thermometer has not been extensively used in practical work. P. H. L. Callendar, in fact, is almost the prominent advocate of the constant-pressure gas thermometer at the present time. He died the constant-pressure gas thermometer a valuable instrument in its own right, but one that is even more useful than those of the constant-volume the.
revised a very ingenious form of the pressure instrument, which certainly
overcome most of the objections that I urged against it in the past. By
the Byland and Harker and Chappuis have shown that the reduced plat
temperature can be determined in terms of the reduced gas thermometer scale by means
of a simple equation of the form:

\[
T' = T + A \cdot \left( \frac{T}{100} - 1 \right)
\]

A being a constant whose value is to be determined experimentally. Callendar and Griffiths,
for the purpose of determining A, recommend that the resistance of the platinum coil of the
thermometer be observed at the temperature of boiling sulphur; the "reduced temperature" of
this boiling point being, according to their experiments with the constant-pressure air ther-
rometer, 444.53° C. (Ewermortopulos states that the boiling point of sulphur on this scale is
between 443.58° and 443.62° C. See Grey Proceedings of the Royal Society, p. 339. Compare,
also, Callendar and Moss, in the same publication, 1909 A, 83, p. 106). The platinum-
thermometer gives great promise of being a highly valuable instrument in the future.
Indeed, it is so already; but it does not yet appear to be capable of determining the absolute
values of temperatures closer than to 0.01° C. It may be used as a differential thermo-
meter, however, so as to give results of a far higher order of accuracy. For this purpose
two similar coils or strips of platinum are used, these being placed in two of the arms of
a Wheatstone's bridge, so that the smallest difference in equality in their resistances can
be observed. (See Resistance, Electrical). Langley's bolometer is an instrument of this
sort. It is used to explore the solar spectrum, and consists of two strips of platinum foil,
which are placed across the spectrum to be examined, with their edges toward the source
of the light. The two strips are placed in the two arms of a sensitive Wheatstone's bridge,
and so long as both the strips are exposed to radiation of the same intensity, the balance
of the bridge is preserved. When one of the strips coincides with a Fraunhofer line, how-
ever, while the other is still exposed to the full radiative power of the source of light, the
balance is destroyed, and the existence of the line is thereby demonstrated, even though
the line be in the infra-red, where it is not visible to the eye.

Thermo-electric couples have been used to a considerable extent for the measurement of
temperature, and Regnault experimented with them somewhat, but showed that they are dis-

tinctly inferior in accuracy to the other known methods of determining temperature. At ex-
ceedingly low temperatures, however, they are often of great value. Wroblewski, for example,
made use of thermo-couples quite extensively for temperature measurements in his researches
on the critical points of the gases which are liquefiable only at extremely low temperatures.
The platinum resistance thermometer is more generally favored, however, for this purpose;
though it cannot be used for temperatures too close to the absolute zero on account of the
anomalous and sudden changes of resistance that occur in that region. (See Resistance,
Electrical). At these extremely low tempera-
THERMOPHONE.—THERMOTAXIS

tures the helium thermometer is still useful, however.

Consult Guillaume, ‘Thermometrie de Precession’ and Preston, ‘Theory of Heat.’ See also, the numerous scientific papers of Kamerlingh-Onnes relating to low-temperature research.

A. L. A. R. E. T. E. N. A.

THERMOPHONE, a resistance thermometer (see THERMOMETER), in which the galvanometer that is most commonly employed is replaced by a telephone. Two coils of platinum wire, which are exposed to the respective temperatures that are to be compared, are introduced into two of the arms of Wheatstone’s bridge whose remaining arms contain constant resistances. The telephone is placed in the cross-arm of the bridge. An alternating or pulsating current of low frequency is used in making the observation, and when the bridge is in balance, this fact is indicated by the silence of the telephone. See Warren and Whipple, ‘The Thermophone,’ in The Technology Quarterly, Vol. VIII, page 125.

THERMOPOLIS, Wyo., town and county-seat of Hot Springs County, on the Chicago, Burlington and Quincy Railroad, and on the west bank of the Bighorn River. It is noted for the large hot springs which issue along the river bank at this place. These springs are considered curative for rheumatism and similar ailments. They are protected as a State reservation. Pop. 1,500.

THERMOPYLÆ (Gk. θερμόπυλα hot gates), in classical geography, a pass on the southeastern frontier of Euboea, Greece, leading from Thessaly into Locris, and on the route of the only good road from Thessaly to central Greece. It was situated between the range of Mount Eta and an inaccessible morass which bordered the Malian Gulf; and in breadth it was a narrow tract of perhaps some 50 feet. Its name was derived from the presence of thermal springs. As the only means by which a hostile army might penetrate from northern into southern Greece, it held a peculiar strategic value in Greek history. It is celebrated as the scene of the defense by Leonidas (q.v.) and the 300 Spartans against the vast host of Xerxes (q.v.) in August, 480 B.C. The account of this battle given by Herodotus has been generally followed. Xerxes, numbering the numbers of the Hellenic defenders (5,280), not counting the Locris, whose numbers are not known, sent against them the Minoa and Cissians with instructions to take them prisoners, and bring them before him. When they failed in this attempt, they were massacred. The picked 10,000, called the ‘Immortals,’ were not forward; but, handicapped by the number of their spears, they were no match for the Hellenes, of whom few fell, while 300 Persians lost. The sea was now in great perplexity, when the pernicious ‘Malian wind’ came to tell them of the way which led across the mountain to Thermopylae. This was immediately crossed by the Boeotians and the Epinaspids, and the rest of the army crossed at Thermopylae. The Persians arrived in the rear of Thermopylae soon after mid-day of day. Tidings of their coming had already been brought to the Greeks by scouts. The Spartans and the Thespian (7,000) and the Thebans (400) were compelled of the Spartans and Thespian, all fell; the Thebans, few escaped. To the Greeks that the Persian arrow darkened the Spartan Diogenes is said to have said, “Good; then we shall fight in the shade!”

Through deposits from the Spero other streams, great alterations have place at Thermopylae, so that it is not pass but a swampy plain. Consult Schal ‘Untersuchungen der Thermopylen’ and various standard histories of Greece also GREECE, ANCIENT.—History.

THERMOPYLÆ OF AMERICA, applied to Fort Alamo, Texas. See THE THERMOMETER.

THERMOSCOPE (Greek, to heat), any instrument for indicating temperature. The term is commonly applied to such instruments as indicate temperature only, or a very limited number of temperatures; or to those which are used for giving changes or difference of temperature or giving the magnitude of these changes. The forms that have been to instruments of this kind are so many, to be almost past enumeration. As a subdivision, the instrument may be considered, indications depend upon the melting alloys. A temperature or device that contains buttons or wires of a number of whose several melting points are known; the observation of temperature by this the instrument is exposed to the ten under examination, and a note is made of the alloys melt, and of which is melted. If T is the melting point of the alloys that have melted, i.e., the melting point of the most fusible alloys that have not melted, we can then the temperature under consideration higher than T, but lower than T, end by using the melting points in the arts, it is quite well known, in this manner, that the temperature between certain limits. A thermoscope can only indicate certain limits between a temperature lies is called a “disc of thermoscope.” Continuous thermoscopes, are capable of affording an actual measure of any temperature within their range, commonly called “thermometers,” while resemble the ordinary mercury-in-glass thermometer. A thermometer in temperature is inferred by noting the resistance of a coil of platinum wire. For example, is called a “platinum resistance thermometer.” See PYROMETER; THERMOMETER; THERMOMETER.

THERMOSTAT, a device in which the variation of heat is utilized to expand a long strip of metal; it can be utilized to regulate a damper or to control approximately uniform steam pressure.

THERMOTAXIS, the regulation temperature of the body. The principal causes of animal heat are muscular exercise and combustion of food, involving also...
n and liberation of carbon dioxide. Body nature remains about normal under many circumstances through the balance main- tained by the nervous system between its pro-
duction and its dissipation. The chief avenues of action are radiation from the surface of the body, the expired air and the excreta. Fec-
tion or fever is believed to be due to an overproduction of heat, to an underelimination of waste substances. The overproduction is believed to arise from an increased combustion especially of cutaneous impulses and the tempera-
ture of the blood, is governed, it is gener-
ally believed, by two nerve-centres, one control-
ating production, the other heat-dissipation.

Thermotropism, a tendency toward.

Thermopoda, a sub-order of dinosaurs (q.v.).

Thersites, ther-sî-têz, according to Homer, the ugliest man in the whole Grecian army that beleaguered Troy. He was a malic-
ious and slanderous brawler whom Ulysses publicly beat and brought to tears for his in-
sulting attack on Agamemnon. He was eventually slain by Achilles for piercing with his spear the eye of the dead queen of the Amazons, Pen-
theseilea, whom he had also spoken of with contumely.

Thery, Edmund, French writer on eco-
nomics: b. Ragnac, France, 1854. He is a com-
mmander of the Legion of Honor, member of numerous societies interested in his line of work and has represented his government in various economic missions to several countries. His writings include 'Europe et Etats-Unis d'Amerique' (1890); 'La France economique et financiere pendant le dernier quart de siecle' (1900); 'La Banque de France de 1897 a 1909' (1910); 'L'Europe economique' (1911); 'Le regime actuel des chemins de fer en Russie' (1913), etc.

Thesem, thè-sè-sôm, or Theseion, thè-sè-sôm, a temple in ancient Athens dedicated to the commemoration of Theseus and his ex-
plorers. It stood on an elevated site north of the Areopagus (q.v.) and in early Christian times was used as the church of Saint George of Cappadocia. Within its precincts is said to have deposited the bones of the hero which he had brought from the island of Scyros, but archaeologists do not support this claim. The temple was begun 465 B.C. Many consider it to have been originally dedicated to Heracles or Hephaestus, but there is no reason to doubt that it is actually a Theseion. It was constructed of Pentelic marble in the purest Doric style and is technically to be described as an amphiprostyle, hexastyle peripteral temple, with prostyle, or opisthodromos or epinae. The façade and the entablature are each six columns; the sides 13 each; their height being about 30 feet. A fragment of the portico and the roof of the stella are still standing. There are also some noteworthy remains of the statue with which the building was adorned by sculptors of the school of Phidias. On the metope are set forth the exploits of Theseus and Heracles and the frieze of the cella is also in part standing. The dimensions of the building are roughly to be estimated at 104 × 45½ feet. Consult Stuart and Revett 'Antiquities of Athens' (London 1762-1816); Leake, 'Topography of Athens' (London 1841); Dyer, 'Ancient Athens, Its History, Topography and Remains' (London 1873).

Theseus, the sôs or the-sè-sôs, in Greek legend, a king of Athens and national hero of Attica, son of Aigeus by Æthra, the daughter of Pittheus of Troizen, in Peloponnesus. He was educated at Troizen, at the house of Pittheus, and passed for the son of Poseidon (Neptune). When he came to years of maturity he was sent by his mother to his father, and a sword and sandals were given him by which he might make
himself known to Θεσμοθήτης (q.v.) in a private manner. On arriving at Athens he narrowly escaped being poisoned by Medea, the sorceress, but managed to reach the town by the sword, and received Theocles as his successor on the throne. He next caught alive the wild Marathonian bull; but a much more important service was the slaying of the Minotaur and the freeing of Athens from the tribute of seven youths and seven maidens annually sent to Crete to be devoured by that monster. (See Μινώταυρος.) Fear- ing his son had perished while in Crete Θεσμοθήτης destroyed himself; hence Theocles on his return succeeded his father as ruler of Athens. The Athenians were governed with mildness, and Thesmophoria were made regular and enacted new laws. The number of the inhabitants of Athens was increased: a court was instituted, which had the care of all civil affairs; and Thesmophoria were made the government democratic, while he reserved for himself only the command of the armies. To him also the Athenians ascribed the union of the towns of Attica into a single state, with Athens at the head, and the division of the people into the three classes of Euxines, Hetaerai, and Demes (nobles, free- men and mechanics). Perhaps the most celebrated of the events in the career of Theocles after the slaying of the Minotaur was his war with the Amazons. He is said to have invaded their territory and carried off their queen, Antiope (according to another account, that with which the readers of Chaucer and Shakespeare are familiar, Hippolyta). The Amazons in their turn invaded Attica, and a battle was fought in the city of Athens itself. Thesmophoria were victorious, and the Amazons driven out of Attica. He was absent from Athens on various expeditions, and when he returned the Athenians had forgotten his services. He retired to the court of Lycomedes, king of Scyros, who threw him down a deep precipice. In 469 B.C. his bones, as supposed, were found by Cimon in Scyros, and brought to Athens, where they received a magnificent burial. Statues and a temple (the Thesenum, or, as was also called, and festivals and games were publicly instituted to commemorate his actions. A portion of the temple still remains standing. What shreds of history, if any, there may be in the accounts of Thesmophoria cannot be ascer- tained. (Consult Harrison, J. E., Mythology and Monuments of Ancient Athens (London 1890); Lübker, F., Realexikon des Klassischen Altertums (Leipzig 1914); Schultz, A., Dies Thesee (Brussels 1874).

THESMOPHORIA, a pagan festival of ancient Greece. It was celebrated only by women, in honor of Demeter. Thesmophoria (“the Lawgiver”) was a festival of agriculture, and thereby of orderly social life and the marriage. At Athens the festival extended to three days, beginning with 24 October. On the first day there was a procession to the temple on Demeter at Eleusis, southeast of the city, on the second a fast; and on the third day, called Kallichorión (“the bearer of a fair offspring”), a general and frequent indulgence.

THESMOTHETHEΣ, θεσμοθήτης (from a Greek word meaning however), one of the six inferior archons at Athens who presided at the election of the lower magistrates, received criminal informations, decided civil cases and performed duties.

THESPESUS, also called Clason, and sometimes referred to as a prehistoric being, who lived in the upper Cretaceous strata in Wyoming, and Colorado show it to have resembled Iguanodon. It was upwards of 30 feet and stood from 10 to 25 feet high. Like many of its species it was herbivorous and had a long forward body by its heavy tail complete sketches of the animal are found in principal museums. (See DINOSAURS.) C. Marsh, O. C., ‘The reconstruction of Cretaceous Dinosaur’ (in Transactions of the Connecticut Academy of Sciences, Vol. XI, New York 1892).

THESPIS, Greek author. He was a of Icaria, a deme of Attica, lived in the 6th century B.C., and is the inventor of tragedy, as he added to the dithyrambic choruses of the feast of Baals the actor, who, when the chorus was silent, actually recited a mythical story; and probably on dialogues with the leader of the chorus appearing successively in different characters. This was a decided step toward drama.

THESALONIANS, Epistles to Authorship— While Paul's authorship of First Epistle to the Thessalonians has sionally been questioned, the consensus of critical opinion is that the present text is the most unanimous in favor of its genuineness, and that is the expression, and not the actual use of Paul's teachings elsewhere. In the whole tone and temper there is in harmony with Paul's teachings elsewhere. The external evidence is strongly favorable to the style and vocabulary as being Pauline; the doctrinal content, while not very rich in harmony with Paul's teachings elsewhere, is above all, in its whole tone and temper unmistakably and inimitably an outpouring of the very heart and soul of the great author. As concerns the Second Epistle the case is somewhat different. Though the evidence is even stronger than for the First letter, yet its Pauline authorship has been far more disputed. The difficulties which have raised grow mainly out of its relation to the First Epistle, and practically reduce to the following: (1) the resemblance in portions of the letters, considered by some to be too coincidental to permit us to think of the second as an independent composition; in answer to this it is said that this likeness covers no more than a third of the letter, and may easily have grown in many cases, as, for instance, before writing Paul might have glanced at a copy of his first letter, (2) the difference in the tone and temper of the two letters, a fact for which several explanations have been offered, as that first letter had failed helpfully to affect the Thessalonians, he might naturally be more formal and distant in his letter, or, as Harnack has suggested, it may have been intended solely for the section of the church, while the other letter, as the main body of the church, which was less in origin, and more loyal to Paul; and (3) the difference in the eschatological teaching, however, does not amount to a conclusive one, but is to be regarded partly as a consequence...
rstanding of the teaching in the first
which misunderstanding seems in spite
correction still to continue in some
and partly is an addition of certain
in Paul’s doctrine of the Last Things
ad not come out earlier, resulting in an
it change of emphasis, but not in a res-
tency. Certainly the difficulties in the
explaining the letter as a forgery have
und greater than of accepting it as
and consequently the later criticism
is exclusively to favor the Pauline author-
both Epistles.

and Place.—From the First Epistle
1 comparison with Acts it is easy to
2 second great missionary journey,
ond European city in which Paul
was Thessalonica, the modern Saloniki.
he established a church at once,
very success caused him to be driven
the city after a stay possibly of only three
months, about a whole of a few weeks.
From there Paul went to Greece,
short stay at Athens and establishing
a year and a half at Corinth. It
that Timothy, who was sent back from
to Corint and poses the Thess-
Church, rejoined Paul at Corinth with
rt, and the first letter must have been
ast at once. According to some
l letter followed the first even without
for an answer and in any case the
cannot have long, a few weeks.
The most common dating is in
of 51, but chronologists vary two
ears either way so far as the years to
gnied to the various events of Paul’s
concerned. These Epistles are accord-
nong the very earliest New Testament
ly James and Galatians being con-
by any to be earlier.

itions of Composition.—It is plain
Thessalonians as well as from Acts
recipe of Paul and of his teaching
ssalonica was peculiarly prompt and

In a very short time a church was
ed, consisting partly of Jews, but
for proselytes and Gentiles, including
f those who were converted in Thess-
aul turned back to Thessalonica as
here his work had been a peculiar de-
nd the mutual affection of the Apostle
verts must have been unusual. But
at the longest had been brief, and in
his plans and endeavors he had found
ssible to return, while at the same time
reason to fear that misrepresentations
iating circulated touching both his failure
it them and his purposes in his mis-
work and his relations to his converts.
he report of his messenger Timothy, and
from a letter to Paul from the church,
ions from which some have thought they
embodied in this letter, it appeared that
one hand a certain fanaticism showing
morbidity and on the other a hand
or doctrinal and spiritual uncertainty had
up in the Church. It was to remedy
itions that Paul wrote his first letter.

Paul is traditionally held that Paul’s letter mainly ac-
ited its purposes, but that either by the
of the messenger who carried it or by
written response from the Thessalonians them-
self, Paul learned that some disorders con-
tinued and that his teaching about the Last
Things needed supplementing to correct mis-
understandings, and thus arose the Second
Epistle.

Contents.—These letters are peculiar in
that two of Paul’s fellow-workers, Silas and
Timothy, are associated with him in the address
(i, 1), though it is plain that in composition and
thought as well as in personal relations it is
definitely his own letter. In 1 Thess., Paul gives
an explanation of his failure to return to
them, adding an assurance of his strong affect-
ion for them and an assurance of his confidence
in their affection for him and their continuing
faith in Christ, all so put as to answer any mis-
representations of him and his work which
might be current (i, 2-iii, 13). Then come
various moral injunctions, first, to chastity, and
then to brotherly love, with which is associated
the duty of diligent labor (iv, 1-12). There
follows the correction of the painful un-
derstanding of some of the Christians as to
their friends who had lately died, by the
assurance that through their resurrection they
would be at no disadvantage when Christ should
return, and encouragement for all in reference
to the same return (iv, 13-v, 11), and, finally,
warnings against various disorders, couched in
brief injunctions, and a few salutations (12-28).
In the second letter, after a brief greeting
(i, 1, 2), Paul gives utterance to a remarkable
expression of thanksgiving and prayer (1, 3-12) ;
then corrects the misunderstanding of what he
had said in his first letter, assuring them that
before the “Day of the Lord” there was much
history to be made, including a great apostacy
(ii, 1-12); a brief encouragement to faint-
hearted brethren follows (iii, 13-iii, 5), and
warnings to the idle and dissolute (iii, 6-15),
the Epistle ending with a word of explanation
of how the Apostle added to his dictated let-
ters a certificate in his own handwriting and
the benediction with which he commonly closed his
letters (iii, 16-18).

THESALONICA. See SALONICA.

THESALY, thes’a-li, or THESSALIA,
the northeastern division of ancient Greece
proper, bounded on the north by the Cam-
burnian Mountains, separating it from Mac-
donia; on the west by the chains of Fundus
and Tymphreus, separating it from Euboea; on
the south by Mount Oeta, separating it from
Etolia, Doris and Locris; and on the east by
the Ægean Sea. The rich plain enclosed bet-
ween these mountains belongs almost entirely
to one river basin, that of the Peneus (Salam-
chernia), which traverses it from west to east,
and finds an outlet into the Thermaic Gulf through
the vale of Tempe. It was especially famed
for its fine breed of horses and its skilful horse-
THETFORD MINES — THIBAULT

men. The name of Thessaly was derived from the Thessali, a Greek people who are said to have come into this land from the west, and who became the governing class in the country. Thessaly was broken up into separate states loosely united under a tagus, and long exerted no influence on the government of Greece generally; but it rose for a brief period to a position of greater consequence when (about 375 B.C.) Jason of Pherae, having been elected tagus, brought the whole of Thessaly completely under his power, and began to threaten the rest of Greece, but the confederacy was again weakened after his assassination in 370 B.C. Thessaly afterward became dependent on Macedonia, and finally was incorporated with the Roman Empire. In 1933, after the fall of the Byzantine Empire, Thessaly came, with the rest of the imperial dominions, into the hands of the Turks, and till recently formed a part of the Ottoman Empire. The greater portion of it was in 1881 incorporated in the kingdom of Greece. The Greco-Turkish War of 1897 was fought principally within the borders of Thessaly. G., 'A History of Thessaly from the Earliest Historical Times to the Accession of Philip V of Macedon' (Leicester, Pa., 1904); Leake, W. M., 'Travels in Northern Greece' (4 vols., London 1835); Philipson, A., 'Thessaliens und Epirus' (Berlin 1897); Wace and Thompson, 'Prehistoric Thessaly' (Cambridge 1912).

THETFORD MINES, Canada, town, in Merrit County, on the Quebec Central Railway, about 76 miles south of the city of Quebec. It is chiefly known for the deposits of asbestos in the neighborhood. There are numerous small industries. Pop. about 7,500.

THETIS, the, in Greek mythology, a daughter of Nereus and Doris, therefore one of the Nereids. Her nuptials with Pelcus were celebrated on Mount Pelion, and were honored by the presence of all the gods except Eris or Discord, who was not invited, and who, to avenge the slight, threw in among the company a cup of discord. By Pelcus she became the mother of Achilles (q.v.).

THEURGY, from the Greek theurgia, meaning divine work, and used among the ancients to signify supernatural agency in individual human affairs, or in the government of the world. Hence the act or art of invoking deities or spirits, or by their intervention conjuring up visions, interpreting dreams, receiving or explaining oracles, etc.; the power of obtaining from the gods, by means of certain observances, words, symbols or the like, a knowledge of the secrets which surpass the power of reason, to lay open the future, etc. The word also means that source of magic which more modern professors of the art attribute to primitive methods of spiritual activity, as evidenced in the natural man. Also a system of supernatural knowledge or power believed by the Egyptian Pharaohs to have been divinely communicated to them, and by them held to give access to spiritual realities.

THEURIET, Claude Andre,ouch port and naval officer, born in France, on 16 April 1867. He married in Paris, received his brevet in 1887 and in that year entered the department of the Ministry of Finance. Soon, however, he turned his attention to literature. In 1896 he was elected a member of the French Academy, having received the prix l'litre in 1860. His poem includes 'Le chemin des bois' (1883); 'Le Bleu et le noir' (1873); 'Nos amours' (1868); and 'La route des saisons et des mois' (1891). He also published 'Jules Bastien-Lepage, l'homme et l'artiste' (1885), but a best known by his novels, among which are 'Nouvelles intrises' (1870); 'Mille Grignon' (1874); 'Chantons dangereux' (1881); 'La Chanoinesse' (1893), etc. He was the author of some 60 works of fiction. He also wrote several dramas including 'Jean-Marie' (1871); 'Le maison des deux Barbeaux' (1885), and 'Jour d'été' (1901).

THIAZOL DYE STUFFS. See COAL-TAR COLORS.

THIBAULT, Jacques Anatole France, critic and novelist: b. Paris, 16 April 1844. He is known wherever French is read and the Latin genius appreciated as a master, and was called by Lemaire, one of the shred-est of his contemporaries, 'the ultimate flowering of the Latin genius.' Son of a Parisian bookseller, another 'France' and a veteran of the body-guard of Charles X. Anatole grew up in the bookish atmosphere which he has conveyed marvellously into several of his stories as he has also his father's character. A Parisian of the Parisians, he was named officer of the Legion of Honor in 1895 and received into the Academy in 1896. For the rest the story of his life is in his writing. Besides early verses his well-nigh 50 volumes embrace charming books of autobiographic 'truth and humour' such as 'Le livre de mon ami' (1895), 'Pierre Nozière' (1900) and 'Les désirs de Jean Sève' (1912); books of philosophical criticisms, as he openly professes, evidencing his own way of thinking in noting the ways of others; chief among them articles collected from 'Le Temps' in five 'Périodes littéraire' (1888-93) and 'Le génie latin' (1913); dramatic experiments, among which 'Thaïs' is best known; an extended controversial biography, 'La vie de Jeanne d'Arc' (1901); expressions of fervid patriotism in stress of war, such as 'Sur la voie glorieuse' (1915), and, finally and chiefly, a long series of books which in the course of fiction express all the manifold phases of his political observations, his social aspirations and indignations, his philosophic speculations and the play of his recreative imagination in evoking the thought and life of a long out-lived past. This fierce, taken chronologically, gives the clue to the development of France out from the dilettante scepticism of Renan, through epicureanism, to its higher and also its lower sense, into an earnest, though still ironic, socialism, with occasional glints of fierce intolerance for ob-scurantists, reactionary or clerical. Outstanding among these books are such as 'Les confessions de Silvestre Bouvard' (1881), his second novel, whose social sympathy with childhood and love of humanity have attracted writers of distinction, among them Lafcadio Hearn, to attempt its translation. 'Balthazar' (1900) and
THIBAUT—THIERRY

(1900), a mediæval and an early in study, show a curiously subtle "piety agnation with impiety of thought, to his own mind were 'La Rotisserie de e Pédague' (1883) and 'Les opinions comme Coingard' (1893) in which the epicurean and courteous figures of reappear in 18th century dress and an comes playful mouthpiece for the ironic ion of a scepticism more radical in than the same Montaigne. Each book, is, is a chain of sparkling epigrams in the laughing philosopher unmarks the uses and inconsistencies of private and morals and life. French politics are the theme of four notable volumes of 'e contemporaire, 'L'orne du mail' ; 'Le mannequin d'osier' (1897) ; s au d'améthyste' (1899) and 'M. et à Paris' (1901), all jewels of grace, ve city. Thibaut's thought takes a serious bent as he is drawn into the lists ola against militarist and religious re- slaves revealed in the Dreyfus case. Of this idence is seen in 'Craignebulle' (1903) ; and his sequel 'Craignebulle' (1906). D'political matters 'L'ile des pingouins' and 'Les dieux ont soif' (1912) as in 'La vie de Jeanne d'Arc' (1908) 'Opinions sociales' (1902). All these whatever their form, are in effect criti- f contemporary life. He has himself at he counts criticism as possibly the e evolution of literary expression, well to a highly civilized society which is old traditions, the last in date of all forms and destined to absorb all. All illustrate an idea of style which he has nairly in 'Le jardin d'Épicure' (1894) ple style," he says, "is like white light; complex but does not seem so. In writ- at appears a beautiful and pleasant sim- is really the result of careful arrange- and strict economy in the use of the parts of speech." In this art of hiding France is almost supreme. See Le de Saint-Simon. B. W. B. Consult an translation of 'Works' edited by c Chapman (London 1908-19) already 27 volumes. Of separate works re many other versions. For criticism see Amédée Simon Dominique, French historian and politi- b. Blois, 2 Aug. 1797; d. Paris, 26 March 1873. As a young man he entered the service of the Minister of Marine, and in 1826 became professor of history at Besançon. His ideas being ultra-liberal, his course was suspended by the Minister of Public Instruction. In 1830 he became prefect of the department of Haute-Saône, and in 1838 returned to Paris, where he was appointed master of petitions addressed to the council of state. He held various other political appointments; but continued his his- torical investigations in the special field he had chosen: the origins of French national history; the early peoples and the neighboring races; and the conquest of the Gauls by the Romans. In 1841 he was elected a member of the institute; in 1860 he became a senator, and in 1868 he received the cross of the Legion of Honor. His works include 'Histoire des Gaulois' (1828); 'Histoire de la Gaule sous l'administration romaine,' (1840-47); 'Histoire d'Attila' (1856); 'Tableaux de l'empire romaine' (1862); 'Récits de l'histoire romaine au Ve siècle' (1860); 'Saint-Jérôme' (1867), and 'Chrysostome et Eudoxie' (1873).
THIERRY—TIERS

THIERRY, Jacques Nicolas Augustin, French historian: b. Blois, 10 May 1795; d. Paris, 22 May 1856. He was educated in the Normal School at Paris in 1811, and in 1813 became teacher in a provincial school. The following year, he quit this occupation and returned to Paris, where he embraced the socialistic views of Saint Simon, and became his secretary and his coadjutor in literary work, and in 1816 published a treatise of his own, "Les nations et de leurs rapports mutuels." Perceiving the theoretical vacaries of his master, he separated from him in 1817, and became one of the conductors of the journal Le Censeur Européen. Shortly afterward he became a contributor to the Courrier Français, in which, in 1820, he published 10 letters on the history of France, which attracted attention. His celebrated work on the Norman conquest of England, "Histoire de la conquête de l'Angleterre par les Normands," was published in 1825, and by the interest of the narrative, brilliance of style and novel mode of treating the subject, attained great success both in France and in England. From his close application to work, he became in the following year almost entirely blind, and at the same time was attacked by a nervous disorder, but still pursued his literary labours. An enlarged edition of the letters formerly written by him for the Courrier appeared in 1827, under the title "Lettres sur l'histoire de la France." In 1830 he was elected a member of the Academy of Inscriptions and in 1834 published "Dix ans d'Etudes historiques." About this time he was entrusted by Guizot, then Minister of Public Instruction, with the editing of the "Recueil des monuments inédits de l'histoire du tiers-état," for the collection of documents relative to the history of France. To this publication he prefixed an "Essai sur l'histoire de la formation du tiers-état," separately published in 1833. In 1840 he published "Recits des temps mérovingiens," which gained him the Gobert prize of the Academy of Inscriptions. There exist translations of his chief works in English. There is a complete edition of his works (10 vols.) by Consul Valentin, "Auguste Thirry" (Paris 1895).

TIERS, t'ær, Louis Adolphe, French statesman and historian: b. Marseilles, 15 April 1797; d. Saint Germain, Paris, 3 Sept. 1877. He studied law at Aix, and was admitted to the bar there in 1818. Desirous of a larger theatre for his ambition he went to Paris in 1821, and having got an appointment on the staff of the Constitutionnel, then the leading Parisian journal, he soon attracted attention by his articles in that paper. Journalism soon ceased, however, to supply sufficient stimulus to his active intellect, and he undertook his "Histoire de la Révolution française," having as colleague Felix Bodin, whose name appeared with his in the first two volumes. The work was completed in 10 volumes in 1827. On the formation of the Polignac Cabinet, Thiers founded with Armand Mignet, the National, whose first number appeared on 1 Jan., 1830. The new democratic organ exercised a decisive influence on public opinion, and the famous ordinances, the signal for the revolution of July, were now issued. Upon this Thiers counseled the issuing by the journalists of a revolutionary manifesto.

It was signed by 43 names. To escape arrest, Thiers fled, on the night of the 28th, to the neighborhood of Saint Denis, accompanied by Mignet and Armand Carrel. Louis-Philippe, becoming king of the French, Thiers was soon made councillor of state in the department of finance. He was elected deputy for Aix, and after the death of Casimir Perier became Minister of the Interior in the Cabinet of Soulétot, October 1832. He next filled offices of from France, and returned in 1836 as President of Public Works and again became Minister the Interior, but in consequence of differences with Soulétot and Gérard gave in his demis 11 Nov. 1834, but soon resumed office as Mortier. He again retired in February 1839, but a few days after returned to power as a foreign minister and president of the council. These offices, after many vicissitudes, he again held in March 1840. Taking a strong interest in the Eastern question he declared in favor of Mehemet Ali of Egypt against Turkey, neither the king nor the chambers wished to resort to extremities, and the policy of having received a grave check he retired in the Cabinet 29 Oct. 1840. He now devoted himself to historical pursuits, and his "Histoire Consulat et de l'Empire," was completed in 1862, in 20 volumes. The revolution of February, 1848, found him prepared accept the republic; and he was a member of the Constituent and then of the National Assembly. After the coup d'état of 1851 he was banished from France, but returned in Aug. 1852. After an absence of 12 years from public life he was chosen in the elections of 1860 deputy for the department of the Seine, and elected in 1869. In this position he regained much of his early popularity. He combated energetically the project of war against Prussia, but France was unprepared, and after the defeat of Sedan the courts of London, Vienna, Saint Petersburg and Florence to seek assisitance against Prussia, but all that he could obtain was a promise that the four great powers would support the proposal of a Consult Valentin. Auguste Thirry.
with one of the thimbles, the performer proceeds to shift the thimbles, covering the pea now with one, now with another, and offers to bet any bystander that no one can tell under which thimble the pea is. The person betting is seldom allowed to win, the pea being extracted by sleight-of-hand. In the United States the trick is commonly known as the shell-game and is frequently played at race-track meetings, rural fairs and other gatherings.

**THIONVILLE**, tê-ôn-vôl, or **DIEDENHOFEN**, dé-dên-hô-fén, Lorraine, an important railway centre, 18 miles north of Metz, stands in a level plain on the Moselle River. Its manufactures comprise gloves, thread and nets; and there are sawmills and tanneries. Thionville is the seat of the Lorraine iron industry. There is some trade in corn, hemp, flax, fruit, vegetables, grain, wine and wood. An important fair is held annually. In the Franco-German War of 1870–71 Thionville was invested after the battle of Gravelotte, and after the fall of Metz it was besieged with vigor. On 28 Nov. 1870, it was occupied by the Germans. It suffered severely by the siege. It was restored to France under the terms of the armistice of 11 Nov. 1918 and confirmed by the Treaty of Paris of 1919. Pop. 14,184.

**THIRD CENTURY.** The central interest of this period lies in the fact that the Roman Empire at the climax of its power and extent, just when presumably it ought to be consolidating itself for a still greater future, began slowly but surely to crumble under the attacks of the barbarians. Toward the end of the century the Goths in Dacia gave the first visible hint of that power to defeat Roman armies which portended so clearly the fall of the empire. In the last decade the Saracens, a predatory Arab tribe, who are usually supposed to have come into history much later than this, began to make themselves felt. Inspired by Mohammed and unified by religious fanaticism in the 7th century they were to prove more fatal to the empire than even the Goths. The success of the barbarians was favored by the disorder consequent on the debauchery of the Praetorian guards. Septimius Severus (emperor 193–211) halted the barbarians for a while but Rome’s decline and fall was inevitable. Severus reigned with vigor as became “the soldiers’ emperor,” defeating his competitors Niger and Albinus, but cruelly putting to death large numbers of the adherents of his rivals, thus further demoralizing the time. His reign came in the midst of a financial crisis for the empire during which the government resorted to debasement of the coinage to bolster up its credit. Severus was the first of Rome’s rulers to lay the foundation of a great private fortune. As emperor he was an extremely hard worker, always at work by dawn, and devoted long hours every day to the duties of his position. On his return to Rome in 202 he was greeted with a popular reception but refused a triumph and in spite of his fortune always lived very modestly. Like many a great ruler, he attempted to found a dynasty and when he died at York (Britain), he bequeathed the empire to his two sons, Caracalla and Geta. Caracalla, having killed his brother, gave a frightful example of imperial misrule. Undoubtedly insane,—nothing else could account
for his utter cruelty.—Gibbon terms him "a common enemy of mankind." During their father's lifetime the two sons had used the family fortune in racing and gaming, caring only to associate with gladiators and chariot drivers. The elder, Septimius, from his love for the more remote provinces, planned the conquest of Caledonia and it was this that brought him to Britain, where he erected the wall known by his name between the Forth and the Clyde. After Caracalla had expended the family fortune he went to the greatest length of cruelty and injustice to secure more. One good result of his desire for money was the granting of Roman citizenship to all the provinces so as to secure the right to levy direct taxes and impost on inheritances (213). In imitation of his father Caracalla visited the various provinces of the empire, but instead of benefiting from his stay, each in turn became the scene of his rapine and cruelties. Having heard that the citizens of Alexandria disapproved his mode of life he ordered a general massacre of the inhabitants. He was finally put to death by his soldiers in the East and was followed by a series of emperors in rapid succession, most of them violent. After Caracalla, who succeeded Caracalla, was put to death within a year by the soldiers. A feminine intrigue then seated Helioagabalus, an Oriental priest, on the throne. He was worse, if possible, than Caracalla and his name has become a byword for utter viciousness. After four years he was succeeded by Alexander Severus, who meant well and accomplished much, but the rule of Rome was now become a difficult task. He tried the expedient of paying an annual tribute to the Goths to keep them from molesting the empire. This token of weakness had, as might have been expected, exactly the opposite effect. Severus was murdered by a mutiny in the army (235) and was succeeded by Maximinus who bravely led his army against the Dacians and defeated them, but was assassinated by his own people near Aquilia the next year. Ballinnus and Gordian reigned very briefly, though Gordian defeated the Persians under Sapor and the last of the line met his death from Philip the Arab who succeeded him in 244.

In 248 Philip was succeeded by Decius who bitterly persecuted the Christians and was slain by the Goths who invaded the empire the following year. The Huns on the Caspian Sea came into history at this time as a new set of enemies for the empire. Emperors continued to succeed each other nearly every year — Gallus (251), Aemilianus (253), Valerian (254) who five years later was defeated, made prisoner and flayed alive by the Persians. Then came Gallienus and the era of the Thirty Tyrants, none of whom deserve particular mention.

The most interesting character of the 3d century is Zenobia, queen of Palmyra (died 274). Her husband, Odaenathus, had set himself up as ruler of Palmyra during the weakness of the empire in the time of the Thirty Tyrants, and she survived to continue his rule. After his death, calling to her aid the mass of the Palmyrene forces and her beauty was such that, if tradition be true, she far excelled the Egyptian queen. For a time during the disturbed state of the Roman Empire, she exercised sway over a large territory, boldly proclaiming herself Queen of the East and bade defiance to Rome. The ruins of Palmyra were among the first to be excavated and studied in modern times and this gave the town a special interest. The Arabs had for long told wonderful tales of a ruined city in the Syrian Desert, but their description was of remains so extensive and magnificent that it seemed that there must be Oriental exaggeration in their accounts. At the end of the 17th century, European travelers reached the site of Palmyra, however, and found that the Arabian stories minimized rather than exaggerated the truth. There was, for instance, a colonnade stretching almost a mile in length and many of the marble columns constituting it are still standing amid the sand of the desert.

Palmyra, as the inscribed monuments show, came into prominence about the beginning of the 2d century. Adrian took the city under his protection and on the occasion of his visit the name was changed to Adrianopolis. It was extremely prosperous a century later, its position between Parthia and Rome enabling it to trade with both. Under Caracalla, Palmyra received the fas italica and became a Roman colony. After Caracalla, who succeeded Caracalla, was put to death within a year by the soldiers. A feminine intrigue then seated Helioagabalus, an Oriental priest, on the throne. He was worse, if possible, than Caracalla and his name has become a byword for utter viciousness. After four years he was succeeded by Alexander Severus, who meant well and accomplished much, but the rule of Rome was now become a difficult task. He tried the expedient of paying an annual tribute to the Goths to keep them from molesting the empire. This token of weakness had, as might have been expected, exactly the opposite effect. Severus was murdered by a mutiny in the army (235) and was succeeded by Maximinus who bravely led his army against the Dacians and defeated them, but was assassinated by his own people near Aquilia the next year. Balbinus and Gordian reigned very briefly, though Gordian defeated the Persians under Sapor and the last of the line met his death from Philip the Arab who succeeded him in 244.

In 248 Philip was succeeded by Decius who bitterly persecuted the Christians and was slain by the Goths who invaded the empire the following year. The Huns on the Caspian Sea came into history at this time as a new set of enemies for the empire. Emperors continued to succeed each other nearly every year — Gallus (251), Aemilianus (253), Valerian (254) who five years later was defeated, made prisoner and flayed alive by the Persians. Then came Gallienus and the era of the Thirty Tyrants, none of whom deserve particular mention.

The most interesting character of the 3d century is Zenobia, queen of Palmyra (died 274). Her husband, Odaenathus, had set himself up as ruler of Palmyra during the weakness of the empire in the time of the Thirty Tyrants, and she survived to continue his rule. After his death, calling to her aid the mass of the Palmyrene forces and her beauty was such that, if tradition be true, she far excelled the Egyptian queen. For a time during the disturbed state of the Roman Empire, she exercised sway over a large territory, boldly proclaiming herself Queen of the East and bade defiance to Rome. The ruins of Palmyra were among the first to be excavated and studied in modern times and this gave the town a special interest. The Arabs had for long told wonderful tales of a ruined city in the Syrian Desert, but their description was of remains so extensive and magnificent that it seemed that there must be Oriental exaggeration in their accounts. At the end of the 17th century, European travelers reached the site of Palmyra, however, and found that the Arabian stories minimized rather than exaggerated the truth. There was, for instance, a colonnade stretching almost a mile in length and many of the marble columns constituting it are still standing amid the sand of the desert.
THIRD ESTATE—THIRD-RAIL SYSTEM

losses, saying that so far all who had been Romans. Finally, she had to withdraw within the walls of Palmyra and Aurelia, despite of the handicap of the desert, led in maintaining the siege of the city. Further resistance hopeless, Zenobia attempted to escape, hoping to find in but betrayed by the influence of Roman law she was captured. Then Palmyra capitulated. All the treasures of the city were seized: inhabitants were spared. Zenobia was sent to Rome to grace the conqueror’s triumph, this, instead of being put to death, was given a villa outside of the city of where she lived peacefully, with her son until her death, making many friends the Roman nobility of the time. It is to her taste that is due the construction of the beautiful architectural monuments of Palmyra which have made the city the subject of much interest, while her own life is with romance.

end of the 3d century, after a long of anarchy, was occupied by the firm of Diocletian, a self-made man, the son of parents, who owed his advance to his own genius. He reigned for some 21 years (284-305) and then (see Fourth Century) resigned and retired to a pleasant country not far from Dioclea, his birthplace in Illyria. When the Roman Mid of the city of or the empire which followed his abdications, the abdications of one of his successors, urged to take up the imperial mantle again, he rejected but see the cabbages which in my garden with my own hands, you no longer talk to me of abandoning this spot for the Empire. As might well be said, the man who was capable of this and did give the Roman Empire years of und prosperity, stained unfortunately by persecution of the Christians, but that did not until the beginning of the 4th century under the influence of those who had opposed to him. The 3d century produced no great men, but we have books that have demanded attention ever since. Plotinus (204-270), a well-known Neoplatonic philosopher, studied at Alexandria and afterward philosophy in Rome, wrote his writings in the middle of the century. He was a Platonist, as well as a Platonist and de- the name of Neo-philosopher. His was Porphyry (233-305) wrote a life of 350 and also of Pythagoras, but is best for his treatise "Against the Christians," was answered by Eusebius at the beginning of the 4th century. It is known to us from Jerome’s commentary and other in criticisms. Longinus (210-273), of the essay "On the Sublime" also be the third in length and spent most of his mature the court of Zenobia in Palmyra. He we have said her chief counsellor and her of her children but on the fall of Palmyra he was put to death as a traitor by Emperor Aurelian. Jeph the es- sence of the "Sublime," one of the best pieces of criticism in the Greek language. (See Sublime.) Papinian, the greatest civil of antiquity, and Dio Cassius (155-230), the Greek historian of Rome, both flourished during the first quarter of the century. Dio’s whole work in 80 books was in existence in the 10th century, only some 25 books XXVI to LX now remain nearly complete with but fragments of the others.

PRINCIPAL EVENTS OF THE THIRD CENTURY.

208. Septimius Severus invade Caledonia after conquest and establishment of military government in Britain.

211. Septimius Severus builds wall across Britain to exclude the Northern Picts.

217. Assassination of Caracalla.

222. Heliodorus slays Alexander Severus reigns.

258. Parthian Empire dissolved. Sassanian Persia Empire founded.

260. Death of Dio Cassius, the Greek historian of Rome.

269. Goths invade the Roman Empire, defeat and kill the emperor Decius.

269. The Persians take Valerian prisoner and flay him alive.

261. The Persians capture Antioch.

270. Death of Plotinus, Neoplatonic philosopher, author of the "Enneads."

272. War with Zenobia, queen of the East.

273. Longinus, philosopher and counsellor to Zenobia put to death by Aurelian.

274. Aurelian subdues Zenobia; yields Dara to the Goths.

284. Diocletian and Maximinus joint emperors. The second Roman embassy reaches China.

287. The Celts or Franks settle on the left bank of the Rhine.

292. Galerius and Constantius become co-emperors to Diocletian and Maximinus. The Roman empire divided into four parts.

297. Siege of Alexandria.

JAMES J. WALSH, Author of "The Thirteenth Greatest of Centuries."

THIRD RAIL. See Electrical Terms.

THIRD-RAIL SYSTEM, in electric railway construction, a method of supplying trains on an electric railway with current sent through a conductor located on the track and termed a third rail. Being the first electric system for handling heavy traffic, it possesses unusual interest. In starting a train of five cars by electricity, from 500 to 1,200 amperes are required.

![Diagram showing typical load carried at power house of Metropolitan Elevated Railway, Chicago, for 24 hours.](image-url)

If such currents were passed through a trolley wheel, very excessive arcing would be caused, due to the fact that the wheel touches the track in a single point. Therefore, the third rail is necessary to carry the current. The diagram shows a typical load carried at a power house of the Metropolitan Elevated Railway, Chicago, for 24 hours.

FIG. 1.—Diagram showing typical load carried at power house of Metropolitan Elevated Railway, Chicago, for 24 hours.
THIRD-RAIL SYSTEM

wire at only one point. The contact surface is not sufficient to carry this current, and burning of the wheel and trolley wire would result. With a sliding shoe, however, instead of a single point of contact, there is a surface about six inches long by two inches wide, and two of these in use at once under normal conditions. The third-rail system differs from the ordinary trolley road only in detail, the principle of operation being similar. These details, however, are such as to make possible the application of electricity to the handling of trains than has been found practicable with the overhead trolley, and the system has thus broadened the field for the application of electricity to railway work, so as to bring it into successful competition with steam for the heaviest classes of service. The reasons for its general adoption on elevated roads were on account of the advantages peculiar to electric traction itself, namely:

1. Reduction in cost of power for handling trains.
2. Increase in passenger handling capacity.
3. A service more attractive to the public generally.

The reduction in the cost of power is obtained largely from the generation of power in a simple central station instead of a great number of smaller plants, as with the steam locomotive system. On this point of economy the fuel bill is one of the large items in the operation of a railroad. With steam locomotives, such as the former used on the Chicago elevated roads, the only fuel available cost in the neighborhood of $3.50 to $5.50 per ton, whereas, in the modern power house, designed for electric railway systems, coal ranging from $1.25 to $1.75 a ton was burned with entire success during the period of low prices for coal. When to this is added the enormous loss in radiation from a large number of steam locomotives, exposed as they are in running over the line of the road, and we compare this with the relatively small loss experienced with a well-constructed stationary boiler plant, it is not surprising that the cost for coal per car mile on the electric railways in Chicago is about one-third the cost per car mile with steam locomotives. The comparison is particularly favorable in Chicago on account of the ability to obtain a very cheap grade of coal directly from the Illinois and Indiana coal fields. In New York and other eastern cities, this difference is not so great, as coal delivered at those points is necessarily higher in price on account of larger freight charges. Besides the saving in the coal bill, there is a further gain by the use of large compound-condensing engine units. The large steam units having a comparatively steady load, develop power with a very much lower steam consumption than the small engines of a locomotive with their constant starting and stopping, and consequent cooling of cylinders, etc. Another item in which a considerable saving is made is in the cost of repairs and renewal of the motor equipment as compared with locomotives.

The second advantage — increase in capacity for handling passengers — is due, first, to the fact that with electric motors a much higher rate of acceleration can be obtained in starting trains, and, second, to the increasing average speed over a given line of road. The trains can also be handled with so much greater accuracy and precision that a much shorter interval is perfectly safe, all of these directly contributing to the end of greater capacity.

The third item — service more attractive to the public generally — is proved by the facts the absence of smoke and steam, and reduction in noise, these being especially important in systems passing through the heart of a large city, as is the case with elevated. In regard to the use of the third-rail system on interurban roads, the same general considerations apply as to the economy of except that trains running less frequently, owing to the generation is not so great. There is another field for the third-electric railway system, which has been developed by the New York, New Haven, Hartford steam road, and that is the light trains for suburban and interurban service on many of their branch lines.

One of the most difficult problems in operating an electric railway system is the tion of the total capacity of a power to the number of cars run, and the subje of this total capacity into proper-sized units. In order to determine these points, it is necessary to be able to estimate the maximum load which will have to be carried during the run and the minimum loads during midday and night. The maximum load does not always depend upon the total number of trains run, some lines more than half of these trains be running light in one direction in order to carry the crowds back on their return. The load on a house operating in connection with an electric railway system varies not only from a minimum during rush hours to a maximum during rush hours, but also momentarily during the day and stopping of trains, these being the most violent when the least

![Fig. 2 — Diagram showing fluctuations in the use of electrical energy on the Metropolitan Elevated Railway, Chicago, at short intervals from 5 a.m. to 11 a.m., ranging from 1,700 to 7,000 amperes.](image)

trains are in service. Under the worst conditions, this rate will vary from 300,000, 4,000 in 15 seconds, or the reverse. It is necessary, therefore, that all parts of the
be especially heavy, particularly the fly-
ner order that sudden changes in the load
interfere with the proper regulation
of engine speed. The accompanying diagram, Fig. 1, shows a
load curve at the power-house. Curve A
shows the train of cars running at the
speed of 100 miles per hour; while Curve C shows a
load with heaters turned on full dur-
rush hours. The high peaks of the
load curve at the rush hours of travel.
second diagram, Fig. 2, shows the vio-
cultations in the demand for electrical
power in the third rail system. The ordin-
ally used for the railroad was largely
of convenience in the first case, as rails
are the easiest form of steel to obtain in rea-
larly, a mile wide. The three rails are ass
mained to the various requirements of
the tracks, angle bars and insulating sup-
port. The value of an ordinary commercial
as an electric conductor, as compared with
tier, is about 10 or 12 to 1, with the
additional disadvantage against the
necessity of the frequent bonding
usually coming in 30-foot lengths.
To his lower carrying capacity, however,
rail at $17 per ton with copper at
r ton, and it can be seen that one can
put a larger amount of steel re-
for a given electrical capacity and still
good margin in favor of the rails. A
rail car carrying about equal to an 800,000 centimeter
able. In purchasing the contact rails for
section of a western railway line, they were
steel of a special chemical composition,
higher electrical carrying capacity than
inary commercial steel rail. The com-
was obtained after a series of experi-
conducted for the Manhattan Railway
York, with a view to getting the best
conductor with a composition of steel
ld be successfully rolled into rails. The
this composition results in a steel rail
as to be unfit for ordinary railway serv-
the conductivity is raised so that, com-
in, copper, the ratio is about 8 to 1,
s 12 to 1 for ordinary commercial steel

**THIRLMERE**

Thirler-meer, England, a long
row lake in the mountains of Cum-
unity, in the centre of the Lake Di-
st of Mount Helvellyn, between Der-
er and Grasmere. It is three miles long
rometer wide. The city of Man-
bought and converted it into a reservoir
water supply, and the system, begun in
completed in 1894 at enormous

**RLWALL**

Thirler-wall, Connop, English
in historians: b. Stepney, Middlesex, 11
7; d. Bath, 27 July 1875. He was edu-
the Charter-house and at Trinity Col-
bridge, where he obtained a Fellow-
fe afterward studied for the law and
led to the bar in 1825. Having ex-
the law for the church he was ordained
some years and after received the
Kirby Underdale, in Yorkshire. Here

he added to his pastoral duties a variety of
literary labors. The first of his works, pub-
lished by himself (his father had previously
issued a number of essays and poems written
by him in extreme youth), was a translation
of Schleiermacher's 'Gospel of Saint Luke,' to
which he prefixed an introduction. This work
appeared anonymously in 1825. His next work
was a translation of the first two volumes of
Niebuhr's 'History of Rome,' with Archdeacon
Hare (1826–31). Then followed the work to
which he chiefly owes his reputation, his 'His-
tory of Greece,' the first edition of which
appeared in Lardner's 'Cabinet Cyclopaedia,'
in eight volumes, between 1835 and 1844. It was
well received, and before the appearance of
Grote's history (the first two volumes of which
were published in 1846) was without a rival in
the English language. Grote himself praises it
for the learning, sagacity and candor it dis-
plays, and said that if it had appeared a few
years earlier he should probably never have
conceived the design of his own work. In 1840
Thirlwall was presented by Lord Melbourne to
the Welsh bishopric of Saint David's, which he
resigned a little more than a year before his
death. He was for a time one of the editors
of the Cambridge 'Philological Museum,' and
during the closing years of his life was a mem-
er of the committee for the revision of the
Old Testament. He was one of the bishops
who spoke and voted for Gladstone's bill for
the disestablishment of the Irish Church.

logical, of Connop Thirlwall' (London 1877–
80); Thirlwall, 'Essays, Speeches, and Ser-
mons' (1890); Stanley, 'Thirlwall's Letters to a
Friend' (London 1882); Morgan, 'Four Bi-
ographical Sketches' (1892); Clark, 'Old Friends
at Cambridge and Elsewhere' (1900).

**THIRST**

a craving for water or other
drink. As appetite shows a need for the intro-
duction of food into the system, so thirst is a
sensation indicating the necessity of an in-
creased supply of water. This sensation is
referred to the throat, yet it is not a purely
local feeling, but an index of the wants of the
tissues at large, for thirst cannot be allayed
unless the water swallowed reaches the stom-
ach, is absorbed and carried into the blood.
Thirst may also be relieved by the direct intro-
duction of water into blood-vessels or by rectal
injections of it, or by its absorption through the
skin. How long the demands of thirst may be
suck successfully withstood cannot be stated defi-
nitely, since human beings as well as the lower
animals differ among themselves, and under
varying circumstances of climate, etc., as to the
degree of tolerance. Certain it is that of all
substances a regular supply of water is most
essential to the maintenance of life, and that a
man deprived of it for even 8 or 10 hours, greater in-
convenience, pain and debility are suffered by
an individual than from an equal deprivation of
solid food. As thirst is but the expression of
a dearth of water in the tissues, any condition
which causes a more rapid elimination of water
than usual will increase thirst. Such is the
effect of severe muscular exercise, especially,
for example, the exertion in a heated atmos-
phere habitual with stokers, iron-puddlers, etc.
Thirst is also increased by certain articles of
food, excess of salt or sugar, for example: in
of the ideals we are striving for now we accomplished marvelously in this late medieval century. Generations which themselves lost or impaired their higher interests, are not to condemn this old time. It was great among the "Dark Ages," though we now it to have been in John Fiske's *expresion of the "Bright Ages."

The central interest of the century and greatest triumph was the Gothic cathedrals. In England and France particularly, but a Germany and Italy there arose in the early of the century some of the most beautiful edifices ever built by man. The general architect and engineer were a problem of these huge constructions with absolute success. The decoration of them made a universal appeal and for sheer beauty and suitability never been excelled. The sculpture of the façade of many of these Gothic cathedrals at Amiens, Chartres, Rheims, and Amboise, the greatest plastic work in the history of art. The figure of Christ over the main door at Amiens has been declared the most beautiful production of the human form divine ever seen. Every phase of cathedral architecture contributed to the perfection of its sculpture. The marble work, the hammered iron of the gates and grilles, the very hinges and latches of doors, the brass and bronze work in connect with the altar, the bells, the stained glass, approached perfection so closely that they have been objects of deep admiration ever whenever men have been profoundly interested in the arts and crafts. The stained glass never been excelled and is still an object of most reverential respect, some of it unapproachable in its beauty.

All the fittings and furnishings of the cathedral, even the least obtrusive, partook of same surpassing qualities. Dark corners were not left unfinished for it was the house of God. Every detail was the object of loving devotion. The needlework of the time is probably the best in history. The cope of Ascoli (c1280) is looked upon as the most beautiful ever made. The church vestments and hangings were charmingly worked, in the vestments for the altar were gems of the metal work, of exquisite line and form, delicately finished and appropriately set with jewels. Mass books, as well as the Books of Psalms used by the educated worshippers, were beautifully illuminated that they have marvels ever since and command high prices in the auction rooms. Manifestly, there was nothing that the people of the time wanted do well which they did not accomplish with marvelous perfection. Their domestic and municipal furnishings partook of the same excellency. The very utensils in the kitchen were beautiful as well as useful and the of the two qualities in ordinary life declared the criterion of culture of a people.

The historic life of the century around the cathedrals very much as their life turned around in the cities and towns. Their education came into existence as the result of the development of cathedral schools and these schools placed under the protection of chancellor of the cathedral. The *studia was as the universities were
se they provided education in so different subjects, grew into their form during the courses of the cen-
At the beginning a few cities, Salerno, Bologna and Paris and one or two, had rather important schools of special-
ts around which various faculties gradu-
ted. By the end of the century there were 20 important universities in our sense of the word with large under-
ate departments and as a rule the three ate departments of theology, law and ine. The course of study for under-
estes was summed up by Huxley in his in-
al address as rector of Aberdeen Uni-
t: "I doubt if the curriculum of any n university shows so clear and generous prehension of what is meant by culture is old trivium and quadrivium. The liberal arts, as the trivium and quadrivium also called, constituted the undergraduate stud
ty of grammar, logic and ic, geometry, astronomy, theology and
ty of these subjects were treated from a fic standpoint and these were really fic universities. The study of the classics basis of undergraduate education did not in until the Renaissance time. Hence y's candid admiration for these old-time sities so that he did not hesitate to say their work brought them face to face all the leading aspects of the many-sided of man. The philosophical teaching schools may be explained as the the ideas, form and as the explanation of the sion of matter resembles the modern al chemistry theory that all matter con-
if an underlying substratum the same in is and differentiated into various sub-
s by the dynamic elements which enter . The scholastics taught that matter and could be annihilated by the power that:
them to existence, but not destroyed y human agency, thus anticipating the n world, after a rather long interval of
icity of matter and the conservation ergy. They faced the ethical problems of nd, especially those which concern social ns, exactly in the same spirit which the n world, after a rather long interval of
to recognize human rights as superior to of property, has come around to again, iting on capital and labor for our time Leo XIII quoted the ethics of Saint as Aquinas, drawn up more than six cen-
ter, numbers in attendance at the universi-
: the end of this century were probably in proportion to the population of the s countries than at any time in the his-
f education down to our own day. The cities of Bologna and of Paris had, dur-
the last quarter of the century, more ts than any university of modern times. d and Cambridge were more numerously ed and beginning. Some of sities were boys of 12 or 13 but gradu-
vas earlier than with us as it is still in foreign countries. On the other hand mature students remained at the univer-
s for years. The great lectures were work-
ir up some special theme. The literary of the universities in philosophy and
teology as well as from the graduate depart-
ments generally was extensive. Original work was encouraged, though it was the subject of severe criticism. Groups at various universities were engaged in encyclopedic research and publication. A series of summaries of knowledge in general and of special departments was made.
The discipline of the immense numbers of students represented a problem which was solved by sharing disciplinary regulation with students committees chosen by the Nations, that is, the organizations of the students from particular parts of Europe in attendance at the university. The Nations were fraternal unions which helped the student when he first came to the university to orient himself and get settled for his university work. They protected students against impositions and furnished in-
formation with regard to courses and pro-
fessors. Many of the features of modern life at our universities were thus anticipated. Initia-
tions accompanied by hazing were common practices and the Nations provided recreation of various kinds. On the other hand when students were ailing or when requests for home were delayed by the vicissitudes of the times, help was provided and students were tided over crises in their affairs. A number of abuses crept into university life through these organizations and conflicts between town and gown are noted before the end of the 13th cen-
tury, but it was later in the history of universities that these became so intolerable as to demand correction. In the early history of the universities the study of mediae was a factor at least as the faculty and new univer-
sities were often founded by the withdrawal of dissatisfied students to some other town.
The graduate schools were the most im-
portant departments of the universities. In theology, Saint Thomas of Aquin or Aquinas has been an authority ever since and the contributions which he made to philosophy have been the subject of enduring interest. There was a magnificent development of law through-
out the various countries; the inevitability of the teaching of law. Canon law particularly was taught with a scientific thor-
oughness unequalled before and unsurpassed since. It became the basis of all European law. The medical schools were, however, the special surprise for our time. Early in the century the Emperor Frederick II made a law for the Two Sicilies requiring students of medicine to spend some three years at the university pre-
liminary to their medical studies, and then four years at medicine, followed by a year of prac-
tice with a physician before they were allowed to practise for themselves. That is a modern standard re-established but recently after a long interregnum. Salerno, the most university medical school, set the example in teaching and insisted on the employment of the natural means of cure, fresh air, water, diet, exercise and oc-
cupation and diversion of mind. These are all emphasized in the famous Regimen Sanitatis Salernitanum, issued at Salerno, at the beginning of the century and published in some 300 editions since the invention of printing. It was the most read popular book on medicine for centuries, republished many times even in the last century. It is as it is extant from this time have been a revelation. The surgery of the four masters of Salerno...
who collaborated in the work quite after the modern fashion of textbook writing is surprising in its anticipation of modern surgery. We have, for instance, the book of Theodoric of Lucca and of Bernard of Morondella against William of Salicet, Lanfranc and Mondeville. In these, anasthesia,—through mandrake and opium,—antisepsis by the use of strong wine—they boasted of union by first intention—and as great many of the operations, especially of whole series of intra-abdominal and intracranial operations, as well as many instruments and modes of treatment considered to be modern are described. In the large, very well-planned hospitals of the time, with finely organized nursing, many operations undreamt of in the intervening centuries until our generation were successfully accomplished, not merely as emergency interventions, but to save suffering and prolong life.

The names of the teachers in these graduate schools, Albertus Magnus, Thomas Aquinas, Roger Bacon, Bonaventure, Duns Scotus and Alexander of Hales, are probably better known than any group of teachers in history. In the middle of the 13th century, Walter de Mapleton and the course of science or of medicine had gained repute in recent years with an increase of interest in the medieval period. Albertus Magnus is the only scholar in history whose name the adjective great has become incorporated as if it were a family name. He was a man of the widest interests, intent on testing all knowledge carefully. Humboldt pointed out how much he knew about physical geography, physics, climatology and the physiology of plants. Meyer the historian of botany declared: "No botanist who lived before Albertus could be compared with him unless Theophrastus with whom he was not acquainted, and after him none has studied plants so profoundly until the time of Conrad Gesner and Casalpino." Albert discussed scientifically the Milky Way and its significance, the irregularities in the moon's surface, lunar rainbows, various kinds of refraction and many other problems supposed to be modern. His great pupil Aquinas, adopting Aristotle, laid down the metaphysical principles which are now coming to be recognized as fundamental ideas in the physical and social sciences. Hence a great revival of study of his works. Even more immediately interesting than these to the modern world is Roger Bacon, the international celebration of whose 700th birthday attracted so much attention at Oxford in June 1914. Bacon probably invented gunpowder, suggested that explosives might be used for motor purposes, boats running without oars or sails and carriages without horses,—discussed the theory of lenses, declared that mathematics and experiment were the two important factors for advance in science; anticipated modern ideas as to Biblical revision, insisted on the value of Greek and Hebrew for education, declared that light travels with appreciable velocity and spoke with assurance of aviation. It is clearer than ever now why the people of his time called him "the wonder of the world and the age.

A feature of 13th century education most interesting for our time is the feminine education of the period. At Salerno in southern Italy women were encouraged to study even medicine during the 12th century and the department of women's diseases was in their charge. We have many licenses to practise medicine in the Two Sicilies granted to women at that time still extant. At Bologna at the end of the 12th century the daughters of the great lawyer and law became an instructor in the law school. All of the Italian universities had women teachers on their staff. The unfortunate Héloïse and Abelard incident at Paris seems to have given rise to numerous institutions of education in the universities of the west of Europe, but in Italy the custom established in the 13th century, and there have been women professors at the Italian universities every century since.

The literature of the century is the proof of the intellectual quality of the time, for it was not only great but widely read. Its value will be best recognized from the fact that probably well-read people know the works of the 13th century better than of any other, except their own, though they are often not quite conscious of the fact, not having noted the dates. The enduring work of the time begins with the Arthur legends put into fine literary form by Wolfram von Eschenbach. To him we owe Lancelot. "Like Paris, handsome, and like Hector, brave," but with a fault that makes him even more appealing, so that probably he is the most interesting character of fiction ever created. Then came the ballads of the Cid in Spain, followed by the Nibelungenlied with the Meistersingers and Minnesingers and then the Troubadours and Trouvères with the Romance of the Rose and Renard the Fox in what we call France and, finally, the Trovatori in Italy, culminating in Dante who, the greatest of the Trouvatori, was just ready to write what has often been proclaimed the greatest poem of all literature, as the century closed. Such other writers as Villhardouin, Joinville, Matthew of Paris, the earliest encyclopedists, Vincent of Beauvais, Thomas of Cantimprato, Bartholomew the Englishman, and such works as that of William of Durandus and Jacobus de Voragine of the Golden Legend, are perennially interesting. The century has also the greatest of the Latin hymns, the 'Dies Irae,' the 'Stabat Mater,' the marvelously beautiful religious poetry of Saint Francis himself, of Saint Thomas Aquinas, of Bernard of Morlaix and of Saint Bonaventure.

The century saw the publication of what must be considered the first of encyclopedias, Vincent of Beauvais, under the patronage of Louis IX, with the aid of a great many young assistants of the Dominican Order whose expenses were generously defrayed by the king, was enabled to gather an immense amount of information for his time. In spite of the difficulty of hand transcription, his work extends to over 50 of our volumes octavo. The matter is well chosen and of wide interest, and the surprise is how many things supposed to be much more modern in human knowledge are to be found in Vincent. Pagel declared "the reading admirable teacher."
at excellent observers they were. The
time of these explorers was Marco Polo, immer in a well-trained group of for
and tendency to exaggeration, who
, like Herodotus, to have had a basis
for all that he told. He visited
than kingdom of Abyssinia as well as
d nearly all the world between He-
urmah, of Siam, of Cochin China, of
Java, of Ceylon and India and he had
resting accounts of the coast of Zan-
distant Madagascar and at the oppo-
site the world of Siberia and the shores
rctic Ocean. Colonel Yule, a modern
literature on the literature of travel, can scarcely
is to praise Polo enough. There were
famous travelers whose works have
wnt to us from the century and are
ed in recent years. Friar John of Car-
nmission to the Tatar emperor of
ning north part of the Caspian Sea,
e Jazarkes, along the Dzungarian lakes
ear the Oronon River. illians of Rubruk or Rubruquis, t-
of whose travels was printed by Hak-
is collection of voyages at the end of
century, went even further. Some of
ervations, as for instance on Chinese
are surprising enough, but he has many
Asiatic nature, ethnography, manners,
commercial customs, that were true to
riar Oderic a little later traveled
India and then through China to Nan-
Peking reached the Great Wall en-
het and appears to have visited Lhasa.
Mandeville (15th century) borrowed
om him, as well as from the Premon-
ian monk Hayton. Most of the men
andered in distant lands were gradu-
the universities of the time and while
credulous with regard to what they
evry much as Herodotus himself, they
olutely depended on for informa-
regard to things which they them-
sees the intellectual education which
the cathedral schools and their develop-
t the universities there was a great
popular education along artistic lines
as initiated in the midst of the build-
he cathedrals. Most of the beau-
the great Gothic churches were made
men of the little medieval towns in
hey were built. None of these had
an or few thousand and probably did
age 10,000 inhabitants. Somehow ar-
isans to do all the beautiful work de-
were found and there was the popu-
to appreciate and the diffusion of lib-
cation to patronize and encourage the
of such beautiful things. There are
hills for the payment to village black-
medieval times, the social history of
ark, which we now rank as artistic mas-
Practically all the decorations and
of their cathedrals were executed by
ismen themselves and even their hells
ed glass were made at home, not
from a distance. Transportation tri-
rew them back on themselves and
technical developments while trans-
1 facilities in our time have had an
opposite effect. To secure the making of such
beautiful things there had to be a skilled and
and for the most important factor. Technical training
probably never been a time when the arts and
and crafts, in our modern sense of that term, have
been so appreciated and cultivated. In this
culture the working classes were probably the
most important factor. Technical training
was provided by the guilds. Boys were
prenticed to trades and crafts of various kinds,
and after four or five years of training became
journeymen and traveled from place to place
to learn the secrets and customs of their craft
in the various regions. After two or three
years of this on the presentation and accept-
ance of an example of their work called a
masterpiece — this is where this old English
word comes from — they were admitted as
master workmen into the guild. This repre-
sented a degree in technics. The guild training
was practically a technical school and as the
guilds existed everywhere opportunities for
arts and crafts education abounded. Any
rowing youth who had taste or talent for any
form of artistic work could easily see an
opportunity for its development and then, more
important still, obtain the chance to do his
work in conditions where encouragement and
appreciation would come to him. In England
et the end of the Middle Ages there were 30,000
guilds (Toulmin Smith), the county of Nor-
folk alone having 900, the small town of Wy-
mondham having 11 still known by name. One
of them possessed a guild hall. All the guilds
of the town are said to have been "well en-
dowed with lands and tenements." In Bury
Saint Edwin, Suffolk, there were 23 guilds;
Boston, Lincolnshire, had 14 of which the titles
and particulars are known and London had a
large number. The guild had increased in num-
ber greatly from the 13th century but there is
definite evidence that most of the important
guilds in existence in England at the end of
the 15th century had been in existence for
several hundred years. During this time they
had accumulated very large amounts of money
and invested funds of various kinds. not so
much from the fees paid by their members as
from bequests of various kinds made to them
because it was felt that they were doing great
good work. Unfortunately it was this accumu-
lation of money that led to their legal destruc-
tion, though a few of the London guilds which
were spared in the time of Henry VIII on the
plea that they were trading or secular associa-
tions and not religious organizations have at
the present time an income of over $50,000
per year each. The old guilds were trades
unions, social clubs, insurance societies, civic
organizations, popular entertainment commit-
tees, but withal religious sodalities enforcing
fulfilment of religious duties yet not permitting
the clergy to hold office or dominate policy.
The social history of the time is its most
interesting feature for our era. The begin-
ing of the period saw the rise of the two great
mendicant orders, the Begging Friars, the Fran-
ciscans and Dominicans. A world so deeply
intent on commerce as to give rise to Hansa
and the great Italian commercial cities that
afforded the example of two large bodies of
men who took voluntary poverty for their lot
so as to be free to do better things in life.
The coming of the Friars in such an age produced a deep impression. Saint Francis is one of the most lovely persons of all history. A young man who, during convalescence from a severe illness, learns in Dean Stanley's words that "the world looks very different when viewed from the horizontal," gets up from it, resolved that the fascination of trifles shall not obscure the good things of life. He proceeded to forget all about himself and his personal interests and found that all the world began to think of him. He got so close to the heart of nature that it is not surprising that we have legends that the birds and the fishes, and even the wolf of Gubbio barked to him. He gathered around him a group of men forever famous for their absolute simplicity of life and for their refusal to let selfish motives rule them in any way. Such a life might seem too ideal to have any practical influence over mankind, and, above all, too mystical to make any appeal except to a mediæval world, yet literally dozens of lives of Saint Francis have been written in our very busy practical age. Probably no other saint of our own time has there been so many people, and above all so many whose opinion is of value, ready to proclaim Saint Francis one of the most wonderful characters of humanity as in our era of crowded interests. The love for Lady Poverty of the "little poor man of God," as he loved to call himself, has appealed to all religious and poetic souls ever since. No wonder that Dante has made such a brave figure of him in the Divine Comedy, and placed beside him as equal in influence and power the great founder of the Dominicans.

The development of hospitals in the 13th century has been the subject of much study in the modern time. Virchow particularly has shown that there was probably scarcely a town of 5,000 inhabitants or more in Germany which did not have a hospital. He attributes this great development, more marked even in other countries than in Germany, to Pope Innocent III who founded the hospital of the Santo Spirito by the old bridge across the Tiber and addressed it as the future center of a universal humanitarian organization. Pope Innocent summoned Guy of Montpellier to Rome, having heard that he was in charge of the best organized hospital of the time, built Santo Spirito under his direction, and then when bishops came to Rome, as they had at regular intervals, he commended the hospital of Santo Spirito to their study and recommended, where it was virtually a command, that there should be a hospital as far as possible like that, according to the conditions in each locality, in every diocese in the world. Many of these hospitals were beautifully built. Municipalities constructed them for their citizens and they were public buildings, part of the scheme of the city beautiful which so many mediæval cities cherished. In smaller places hospitals were often built by the nobility and Virchow has called attention to the number of them constructed under the patronage of the family to which Saint Elizabeth of Hungary belonged. The love for Mary, as Madam de Variationen in her book on the beautiful church erected in honor of a few years after her death now stands, was a model for others. The hospital in Siena, added to (14th century) in memory of Saint Catharine, was another centre of charitable influence. The sister of Saint Louis of France was the mistress of an hospital at Tonnerre, which Viollet le Duc figured in his Dictionary of Architecture. It shows how well these hospitals solved problems of hospital construction which have vexed us again in the modern time. They was a fine organization of nurseries in hospitals under the care of religious orders men and women, especially the Augustins. How well their work was done can be best appreciated from the great development of surgery which took place at this time, for no surgery is impossible without good hospital and good nursing. Portions of many of the hospitals remain as evidence for what they were.

With a notable development of social service during the century and the opportunities afforded for feminine education, it is not surprising that the names of a series of women this time are well known, indeed their press has been growing constantly in this last generation, just in proportion as similar opportunities for men developed. The women of Hungary is probably the most famous, the beautiful cathedral erected in her honor Marburg within a few years after her death, one of the handsomest monuments ever raised to a woman, and the testimony of her general to their affectionate regard for the dear Saint Elizabeth (Frau Heilige Elisabeth) they quaintly called her because she was a wife and the mother of four children, though she died at 24, had found time to do great work for the poor around Queen Blanche of Castile, the mother of S. Louis of France, was another wonderful one of the time. Her great son attributed all he was to his mother's training. She was a wise administrator of high ability who fitted her out of a period of threatened anarchy to serve his kingdom for her boy, and yet deep that she would rather see him dead at feet than know that he had committed a sin. The great women of the time came not only on thrones but also among the classes. Another mother of the time whose name is recalled in veneration was the of a London tradesman, Mabel Rich, a son, Saint Edmund of Canterbury, one of most sterling characters of the time, a churchman, made archbishop, went into rather than submit to a tyrant king. Edmund tells how the poor around his mother's home London blessed her for her charity and quite frank that he owed nearly everything life her. Another distinguishes English woman whose name has come down to us this time is Isabella, the famous Countess Arundel. She did not hesitate to admit even the king himself, Henry III, when he visited the liberties of England. Mme Paris says that with a dignity which was than that of woman she reminded the that many times he had, extorted money to his subjects and not kept his word and rights of Englishmen then done, the king was violating them. With this interest in Saint Francis there has been a parallel rebirth of admiration for Saint G of Assisi who at the age of 17 left him have Saint Francis teach her how to live.

The foundation of the Ottoman or Turkish
Empire (1299) under Othman I in Bithynia
led to the consolidation of Mohammedan power
the serious disturbance of Europe. The
Turks are historically regarded as the Mongols
who had already created the splendid empire
of the Seljuks and who from the 11th to the
13th century governed the greater part of the
caliphs’ dominions in Asia and thus prepared the
way for the Ottomans, their successors. The
nucleus of their empire was formed in Asia
Minor toward the end of the century under
Er
dogruhl. Osman or Othman or Ottoman, his
son, is looked upon as the founder of the
empire.

The century saw the career of the best ruler
of all time, Louis IX of France, or Saint Louis
as he came to be called. It has been said of
him, “Of all the rulers of men of whom we
have record in history, he probably did his
duties the most seriously with most regard for
others and least for himself and his family.”

The watchword of his rule was justice, though
he made it the aim of his life that men should
have justice and education, and when for any
misfortune they needed it—charity. For an
unjust judge there was short shrift. The old
tree at Versailles under which he used to hear
the causes of the poor who appealed to him
stood for many centuries the living reminder
of Louis’ efforts to make the dispensing of justice
equal to all men. Voltaire, unsympathetic in
so many ways, said of him, “Louis IX appeared
to be a prince destined to reform Europe if
she could have been reformed, to render France
triumphant and civilized and to be in all things
a pattern for men. A far-reaching policy was
combined with strict justice and he is perhaps
the only sovereign who is entitled to this praise;
prudent and firm in counsel, intrepid without
 rashness in his wars, he was so compassionate
as if he had always been unhappy. No man
could have carried virtue further.”

Guizot, the French statesman and historian, so little
appealed to by the medieval, said “The world has
seen more profound politicians on the throne,
greater generals, men of more mighty and
brilliant intellect, princes that have exercised more
powerful influence over later generations; but
it has never seen such a king as this Saint
Louis, never seen a man possessing sovereign
power and yet not contracting the vices and
passions which attend it, displaying upon the
throne in such a high degree every human vir-
tue, purified and ennobled by Christian faith.
He was an ideal man, king and Christian, an
isolated figure without any peer among his suc-
cessors or contemporaries.” His reign is the
history of France for nearly 50 years (1226-70).
He influenced not alone France but the other
peoples of his time deeply. He was chosen as
the umpire in disputes in foreign countries.

Louis’ instructions to his son, so emphatic
of justice as the great law among men, his
deep interest in education, his foundation of the
Sorbonne, his beneficence to the University of
Paris, his encouragement of art and architecture,
La Sainte Chapelle is his monument, as
well as his scholarly patronage of men of letters
in friendly intercourse, all stamp him as one of
the most broad-minded of men.
Two great Spanish monarchs deserve to be remembered beside Saint Louis. They are Ferdinand (1208-52), the saint, king of Castile and Leon, whose mother, Berengaria, was the sister of Blanche of Castile, the mother of Saint Louis. To him is due the collection of translations in the vernacular of the Forum Iudicum of the local municipal courts. He was one of the oldest speciments of Castilian prose extant and the foundation of Spanish jurisprudence. His son, Alfonso X (1221-84) the Wise, is also known as the astronomer because of the Alfon-sine tables, a series of astronomical observations compiled by his direction, but better known as the author of the code Las Siete Partidas, the basis of modern Spanish law. Ticknor ('History of Spanish Literature') declared that Alfonso "first made Castilian a national language by causing the Bible to be translated into it and by requiring it to be used in all legal proceedings." Under these two great monarchs, Spanish literature began its magnificent career, and the ballads of the Cid and of Bernardo del Carpio became the common property of the people.

Surprisingly enough one phase of political history outside of Europe in the century is as important as anything in Europe. Genghis Khan founded the Mongol or Mongol Empire. He was a Tartar (Tatar) chieftain, by name, Temuchin, who on the death of his father succeeded to the Mongol throne at the age of 13 (1175). The chief who owed him allegiance were turbulent and restless, and had been restrained by the iron rule of his father. They refused to submit to a mere boy, but Temuchin's mother had the courage and vigor to repress many of them and keep them to their allegiance until Temuchin showed before long that he could rule them himself. He soon extended his sway over neighboring chiefs and in 1206 proclaimed himself emperor, invaded northern China and securing firm footing within the Great Wall soon conquered most of the country. He then turned westward, defeated the Mongomedans who had heaved his envoy, overwhelming an immense army of nearly half a million, of whom 100,000 were left dead on the field. Pressing westward he besieged Bokhara, captured Arta, and good Merv, all of which were sacked and burned. Astrakan was taken, the Russians defeated and Great Bulgaria ravaged. His troops conquered more of India and most of China, so that this one-time chief of a petty Mongol tribe "lived to see his armies victorious from the China Sea to the banks of the Dnieper; and though the empire which he created ultimately dwindled away in the hands of his degenerate descendants, leaving as a wreck behind, we have in the presence of the Turks in Europe a consequence of his rule, since it was the advance of his armies which drove their Osmanli ancestors from their original home in northern Asia and thus led to their invasion of Byzantium under Osman and finally their advance into Europe under Ammirath I.*

Representative government developed during the century parallel with other achievements. Magna Charta was signed in 1215; the constitutional rights of the upper classes were also granted to all free men of our kindred, for us and for our heirs forever; all the underwritten liberties to be had and held by them and their heirs of us and our heirs forever. Whatever the reason, this eventually a grant to all free Englishmen in 1257. The Provisions of Oxford of Henry III established the stated reelection of the House of Commons. The great national council of Parliament, the Knights of the Shire, and the representatives of the twelve great lords who formed the House of Commons were admitted to government, while those personally summoned by the king from the nobles were called the House of Lords. Beginning under Edward I, the attendance of members became regular, making Parliaments really representative of the country. At the same time, Bracton's 'Digest of the English Common Law' (1262) secured the basis of law down to our own time. English-speaking countries.

Nothing of all this accomplishment of century probably possesses livelier interest for us than our commercial history. During the century, trade combinations and municipal trade combinations and municipal preferences, which were so important to different peoples, were rendered even more easily. Some of the more important developments of international intercourse anticipated. Miss Zimmer ('The Ha-League,' Stories of the Nations Series)

"There is scarcely a more remarkable development in history than that which deals with the balance of power, in the alliance or association known as the Hansa League. The league has long since died away, having served its time and final purpose. The needs and circumstances of trade have changed and new methods and instruments have been devised for carrying on the commerce of the world. Yet, if the Hansa League has disappeared, the beneficial results of its action survive to Europe, though they have come so completely a part of our present-day life that we accept them as matters of course. We do not stop to inquire into their origin.

The condition of the great mass of people as the result of the growth of genuine wealth in this period is particularly interesting for our time. We have people everywhere the happiest century of human life. More men and women than probably other time enjoyed the blessedness of finding their work and that work being sufficiently remunerative, because it represented an interest of mind or soul rather than the body. Power and the art impulse were not spread, and triumphs of arts and science were made even in very small towns. Those without special talent the name.

Thurid Rogers, in his 'Economic Institutions of History,' says: 'On the whole were none of those extremes of poverty which have excited the astonishment of philanthropists and the indignation of men. The age, it is true, had its disadvantages, but of poverty that perishes under the will to work and opportunity, there was little or none. Wages were very low, accorded standards, but a broad agreement between wages and prices in the consideration. The social improvement

WALSH, Author of "The Thirteenth Century and Its Days." THIRTY-NINE ARTICLES, The. See ARTICLES, THE THIRTY-NINE. THIRTY TYRANTS, (1) a body of Athenian aristocrats, headed by Critias and Thrasymenus, who undertook to administer the affairs of Athens at the close of the Peloponnesian War, 404 B.C. They put to death their opponents, and set a Spartan garrison in the Acropolis. Later Thrasymenus led the exiled citizens against Athens, defeated the Spartan forces of the Thirty, and slew Critias. Democratic government was restored and soon afterward recognized by Sparta. (2) The Thirty Tyrants of Rome were a band of revolutionists who tried to secure the imperial power during the reigns of Valerian and Gallienus (qq.v.).

THIRTY YEARS’ WAR, so called because it lasted from 1618 to 1648, was at first a struggle between Protestants and Roman Catholics, north Germany supporting the former, and southern Germany, with Austria at its head, the latter cause. It gave the Swedes an opportunity to extend their dominion south of the Baltic, it reduced the resources and weakened the power of Austria, and it gained for the northern states of Germany the breathing space needed to develop independent existence. Few wars, however, have been more calamitous in their general effect on the mass of the people and the happiness and progress of mankind. Apart from the horrors which attended the capture of Magdeburg, and other barbarous scenes of the struggle, it reduced the peace and prosperity of the townsmen and made the townsmen to abject misery; it may be said to have effaced for a time literature and art in Germany, and it magnified the system of petty principalities, since partly effaced as a result of the Napoleonic wars, but still a powerful obstacle in the way of complete German progress.

On the one side were Austria, nearly all the Roman Catholic princes of Germany, and Spain; on the other side were, at different times, the Protestant powers and France. The occasion of this war is to be found in the fact that Germany had been distracted ever since the Reforma- tion by the mutual jealousy of Roman Catholics, Lutherans and Calvinists, which led the Protestant princes to form the Evangelical Union in 1608, against which the Roman Catholic League was formed the following year. Certain concessions had been made to the Protestants of Bohemia by the Emperor Rudolf II (1609), but these were withdrawn by his successor Matthias in 1614, and four years afterward the Bohemian Protestants were in rebellion. Thus began the first part of the long
war, the part that is known as the Bohemian War. The Protestant Bohemians were led by the Union, and an auxiliary corps into Bohemia, under the command of the brave Ernst, count of Mansfeld. Their leaders were driven by the imperial troops from Bohemia, invaded the archduchy of Austria, and advanced to the gates of Vienna, but their failure to conquer and win over the greater part of the Protestant Bohemians since the religious peace of 1552 were to be restored to the Church, the Calvinists were to be expelled from the benefits of that peace. This or which threatened to take a large number of bishops and almost all the abbey and ecclesiastical foundations of north Germany of the hands of those who then held the all Protestant Germany with alarm and longed the war. Many princes and refused to obey it, and the emperor was in order to give effect to it, to keep his in the field. But these forces did not main the command of Walle in a meeting of the princes of war in August 1630, Ferdinand found it easy to yield to the general demand for I tion, and the supreme command of the armies was given to Tilly, who then marched against Magdeburg, which had to carry out the edict.

In the meantime a new hellerant as on the scene, one whose exploits interested episode of the whole was was Gustavus Adolphus, king of Sweden landed on the coast of Pomerania on 1630. The inducements which led him himself up with the struggle were the protecting Protestantism in Germany, establishing the power of Sweden on of the Baltic and that of checking the power of Austria in north Germany, this last year he had the secret su French minister Richelieu, who was of the growing power of the house of Sweden Adolphus was generally by the inhabitants of the Protestant Germany as their deliverer, but the princes did not extend to him so eager a come. Fearing the revenge of the emperor for the most part refused his offered and at the diet of Leipzig resolved to a neutral attitude. The old Duke of Pomerania whose territory had been terribly devast imperial troops, had at once opened to him, but the electors of Branden Saxony refused him a passage through their territories, and while the time was in negotiations the town of Magdeburg repeated assaults, was taken and destroyed in May 1631. Tilly now threatened the elector, John George I, hasten to his own defense, the alliance he refused in the interests of Prussia. On 17 September (O. S. 7 Sept the forces of Tilly and Gustavus Adolphus at Breitenfeld to July 1631, the former were completely defeated, and treated to the south while the Sweden advanced to the Main and Rhine. By the end of winter the latter had made his supporter of the 1631 Christian of Denmark received back all the territories belonging to him that had been occupied and devastated by the imperial troops, on the condition of promising to interfere no more affairs of Germany.

Austria went on more victorious; but her greater victory the more complete war the triumph of the Roman Catholic Church. With this object the emperor issued the of Restoration, in virtue of which all the religious foundations and other church that had been favorable to the Protestantion since the religious peace of 1552 were to be restored to the Church, and the Calvinists were to be expelled from the benefits of that peace. This order threatened to take a large number of bishops and almost all the abbey and ecclesiastical foundations of north Germany of the hands of those who then held the all Protestant Germany with alarm and longed the war. Many princes and refused to obey it, and the emperor was in order to give effect to it, to keep his in the field. But these forces did not main the command of Walle in a meeting of the princes of war in August 1630, Ferdinand found it easy to yield to the general demand for instruction, and the supreme command of the armies was given to Tilly, who then marched against Magdeburg, which had to carry out the edict.

In the meantime a new hellerant as on the scene, one whose exploits interested episode of the whole was was Gustavus Adolphus, king of Sweden landed on the coast of Pomerania on 1630. The inducements which led him himself up with the struggle were the protecting Protestantism in Germany, establishing the power of Sweden on of the Baltic and that of checking the power of Austria in north Germany, this last year he had the secret su French minister Richelieu, who was of the growing power of the house of Sweden. Gustavus Adolphus was generally by the inhabitants of the Protestant Germany as their deliverer, but the princes did not extend to him so eager a come. Fearing the revenge of the emperor for the most part refused his offered and at the diet of Leipzig resolved to a neutral attitude. The old Duke of Pomerania whose territory had been terribly devast by the imperial troops, had at once opened to him, but the electors of Branden Saxony refused him a passage through their territories, and while the time was in negotiations the town of Magdeburg repeated assaults, was taken and destroyed in May 1631. Tilly now threatened the elector, John George I, hasten to his own defense, the alliance he refused in the interests of Prussia. On 17 September (O. By the end of winter the latter had made his supporter of the 1631 Christian of Denmark received back all the territories belonging to him that had been occupied and devastated by the imperial troops, on the condition of promising to interfere no more affairs of Germany.
on the banks of which Tilly had taken strong position. On 15 April 1632 this was forced by the Swedes and Tilly mortally wounded during the engagement. placed in the path of Gustav Adolphus, accompanied by the former Palatine, Frederic V, advanced as far nich, the Bavarian capital. Meantime emperor had in his distress again turned to store and induced him by treaties the concessions to undertake to levy and command a new army. After a successful operation against the Saxons, Wallenstein joined the troops in Bohemia and marched with into Franconia, where the Swedes had themselves strongly not far from Nuremberg. On arriving there Wallenstein took their strong position in the neighborhood fortified a camp. Here the two armies lay against each other without coming ched battle and the attempt to evict the resources of the neighborhood were ended and resolved to venture upon an attack against the enemy’s camp. But in spite of the of the assailants, the attack, again and again defeated, was hired by the forces of Gustavus adolphus, was obliged to give up the hope of his attempt and soon after he led his forces to Saxony. Thither Wallenstein followed, and on 16 Nov. (O. S. 6 Nov.) 1632, was fought at Lützen, near Leipzig, in Wallenstein was defeated, but in which he the Swedes lost their king and leader. The death of Gustavus Adolphus the in of the war was assumed by the Chancellor Axel Oxenstierna, who, in this capacity, got the Protestant princes and of the Franconian, Swabian and the two circles of the Germanic empire to in the Heilbronn Convention to uphold the edes until the victory of the Protestant forces should be secure. The principal generals elected under him were Bernhard von der and the Swedish general Horn. France supplied the money. Bavaria was laid by the Swedes, who since the death of carrying on the war in as barbarous and as the intention of penetrating now ed in Silesia. In this province and in a Wallenstein lingered without exhibiting the energy that was demanded of the imperial court. This slackness, to with the circumstances, caused him to the notion of entering into treasonable negotiations with the enemy, and Ferdinand ultimately deposed him and placed him under the the empire, in consequence of which he ordered by some of his own officers (25, 34). After this the imperial army moved Bavaria, and on 6 Sept. 1634, gained a victory over Bernhard von Weimar dillingen. Several German princes, the of whom was the Elector of Saxony, never being well inclined to the Swedes, thought it convenient to conclude separate with the emperor, and the people of the region to cherish the hope of soon seeing the end of the war. The separate peace between the peace of Prague, was concluded 30 May 1635, and in it Sweden obtained some of Lusatia as a hereditary possession, and the emperor virtually gave up the restitution.

The hopes raised among the people of Germany by this and other separate peace were far from being confirmed. Germany itself was almost unanimous in desiring peace, but the Swedes thought it to their interest to go on with the war in order not to lose the advantages they had gained, and France now determined to take a more active part in the war, with the view of abolishing the house of Hapsburg and extending the French boundaries to the Rhine. Richelieu promised to the Swedes important aid in money and troops, and the war was renewed with greater vigor than had been shown since the death of Gustavus Adolphus. The Swedish generals Baner conquered and rendered desolate Saxony and Thuringia (1636); Bernhard von Weimar took Rheinfelden, Freiburg and Breisach (1638), and formed the scheme of creating for himself an independent principality on both banks of the Rhine, but was stopped short in his career by death in 1639. In the midst of these events the emperor had died (February 1637), and had been followed by his son Ferdinand III, a man of milder and less energetic temper than his father, but as firmly attached to the Catholic faith, and equally inclined to force it on his subjects.

In the autumn of 1640 the new emperor assembled a diet at Ratisbon to deliberate over the best method of conducting the war, and while this council was sitting, Baner, who had for the last few years been constantly engaged in the east of Germany, conceived the audacious plan of leaving his winter quarters and taking the whole council, along with the emperor, prisoners (January 1641). A sudden thaw prevented the execution of this scheme by melting the ice on which he had hoped to cross the rivers. Baner died during the retreat. He was succeeded in the command of the Swedish army by Torstenson, the ablest of the generals who proceeded from the school of Gustavus Adolphus. Although generally confined by the gout to a sedan chair, he astonished the world by the rapidity of his movements. He vanquished the imperial armies near Leipzig (Breitenfeld 1642), advanced into Moravia with the intention of penetrating further, attacking the emperor in his capital, but suddenly appeared in Schleswig and Holstein and put to flight Christian IV of Denmark, who had lately allied himself with the emperor and brought an army into the field (1643). Later (August 1645), Wrangel, another Swedish general, forced Christian to accept a disadvantageous peace. After his victory over Christian IV, Torstenson again turned south, and having destroyed two imperial armies, one under Gallas and the other under Hatzfeld and Götz, in conjunction with Rakoczy, prince of Transylvania, once more, threatened Vienna (1645). But the emperor was again delivered from the danger. The withdrawal of Rakoczy obliged Torstenson to give up his design; and in the following year, worn out by illness, he resigned his command, which was taken up by Wrangel. Meantime the French had been operating on the Rhine and in the west of Germany. After the death of Bernhard von Weimar they had taken widower of Luxemburg as a hereditary possessor, and the emperor virtually gave up the restitution.

After his victory over Christian IV, Torstenson again turned south, and having destroyed two imperial armies, one under Gallas and the other under Hatzfeld and Götz, in conjunction with Rakoczy, prince of Transylvania, once more, threatened Vienna (1645). But the emperor was again delivered from the danger. The withdrawal of Rakoczy obliged Torstenson to give up his design; and in the following year, worn out by illness, he resigned his command, which was taken up by Wrangel. Meantime the French had been operating on the Rhine and in the west of Germany. After the death of Bernhard von Weimar they had taken widower of Luxemburg as a hereditary possessor, and the emperor virtually gave up the restitution.

The French had been operating on the Rhine and in the west of Germany. After the death of Bernhard von Weimar they had taken widower of Luxemburg as a hereditary possessor, and the emperor virtually gave up the restitution.
in great part destroyed. He himself was mortally wounded soon after. In the following year neither of the French generals Enghien and Turenne was able to gain any considerable advantage; but on 3 Aug. 1645, the Austrian general Gallas was invested near Nördlingen, after which the junction of the French and Swedes was inevitable. Late in the summer of 1646 their united armies advanced through Swabia and Bavaria, and in the armistice of Ulm (March 1647) compelled Maximilian of Bavaria to fall away from the emperor. In the following year further successes were gained and Wrangel was on the point of uniting his forces with those of the other Swedish general Königsmark who had penetrated into Bohemia, when the news reached the armies that the Peace of Westphalia, which had been negotiating for five years at Munster and Osnabrück, was concluded. By a singular coincidence it happened that the last blow of the war was struck at the place where the war originated, Prague. Königsmark had taken one part of the town and was preparing to attack the other when he was stopped by the news of peace. THISBE. See PYRAMUS AND THISBE.

THISTLE, a composite plant of the genera Carduus, Cirsium, Centaurea, Onopordon or Onos. Other related plants are the golden thistle or Spanish oyster-plant (Scylolus hispanicus) whose roots are used as a vegetable like salisly and parsnip, which they resemble somewhat closely in flavor; globe-thistles (Echinops), often planted in shrubberies and borders as ornaments for their striking effect; blessed thistle (Cnicus benedictus) a hardy annual herb useful for rockeries and wild gardens, but commonly regarded as a weed in the Mediterranean region where it is native, and in California where it has escaped cultivation; and the milk-thistle, called blessed or holy thistle (see SILPHIA), often grown in European gardens for its edible roots, leaves and heads and also for its ornamental qualities. Several plants of other families have sometimes been called thistle from their apparent resemblance to true thistles. The best known of these are probably the blue thistle (Echinum vulgare) of the Mediterranean, and the fuller's or clothier's teasel (Dipsacus fullonum) and its few related species of the family Dipsacaceae.

Among the best known genera the following species are probably most widely recognized. The Scotch or cotton thistle (Onopordum acanthium) is a biennial occasionally grown in America. It is sometimes found in the Eastern States. It has cottony white spiny foliage and large solitary terminal heads of pale purple flowers. The plants are often six feet tall and are planted in front of dark colored shrubbery. They seem unlikely to prove troublesome as weeds in America. Some of its other popular names are Queen Mary's, silver, Argentinian, ass' and down thistle. The Scottish thistle seems more likely to be really the stemless thistle (Cirsium aculeolatum) which is common in land. The so-called Canada thistle (C. arvense) is a native of Europe and Asia, widely naturalized in North America, and a troublesome weed in fields where cultivation and rotation are faulty, as both by its seeds and its perennial root-stocks, every fragment of which is capable of propagating a new plant. Pink leaf formation by persistent cultivation is a serious remedy as well as a safeguard. It is a slender herb about three feet tall and numerous small purplish pink flowers. The bull thistle (C. lanulatum) and the thistle (C. horridulum) are also well known and are found along roadsides in especially pastures. The pasture thistle (C. odoratum) is found in cultivation. The star thistle (Centaurea calcitrapa) bears a resemblance to the blessed thistle. Several related species, notably the corn blue bottle, bachelor's button or blue cyclamen) and the dusty miller (C. incana) popular garden plants. Three species of thistles—the Scotch (S. scoticum), the field (S. arvense) and the spiny (S. asper)—are well-known weeds in the United States and the Carlene thistle (C. vulgari) plays a similar role upon poor soil in Europe. The last was so named because tradition says that Charlemagne used them medicinally.

THISTLE, Order of the. See ROYAL.

THISTLE-BIRD, the American go (q.v.).

THISTLE CROWN, the name of a coin of James VI of Scotland, of the value 97.3 cents. It bore on the obverse a rose on the reverse a thistle, both crowned.

THISTLEWOOD, Arthur, Esq.; born at Tufthorns, near London, 1 May 1820. He is said to have been a habituated anarchist and to have been arrested on the way from Paimie and from a visit to France in the fall of Robespiere. He entered the 1798 and rose to the rank of a lieutenant in various regiments, both natural and of gambling and dissipation, he became an active member of the society formed by Spence, which aimed at revolutionizing social institutions. He attempted to organize an revolution in 1816 which failed. He then went to France and there met with little success in the efforts of informers, and in 1817 was arrested for treason, but escaped conviction. In 1841 he suffered a year's imprisonment for treason, but escaped conviction. In 1841 he suffered a year's imprisonment for treason, but escaped conviction. OBURN, Isabella, American missionary loucator: b. near Saint Clairsville, Ohio, 1840; d. Lucknow, India, 1 Sept. 1901. One of Scotch-Irish parentage. She was ed in the Wheeling Female Seminary, mented by a year in the study of art at Cincinnati Academy of Design. After
ng in the public schools for several years, ent a year as an instructor in a private at New Castle, Pa., and, in 1866, became tress of the Western Reserve Seminary st Farmington, Ohio. In 1869, at the or-
tinent, she received the degree of M. D. by the Methodist Episcopal Church, as selected as its first missionary, being ed to work in India, whither her brother, M. Thoburn (q.v.), had gone 10 years . In April 1870, she organized a school tive girls at Lucknow with but six pupils erself as the only teacher. She also en- evangelistic, Sunday school and zemana. The grade of the school thus established rapidly raised as its attendance increased. a full high school course was offered. in response to a demand for still more ad- l courses of instruction, classes in the collegiate grades were offered in 1887 n 1895, after having complied with the requirements of the British Indian gov-
ent, it was granted a charter as the Luck-
Woman's College. Climatic conditions, seriously impaired her health, necess-
several extended furloughs, the years 2, 1890-90 and 1890-90 being spent in ca, though they were years filled with y in behalf of the cause to which her lite ven devoted. The name of the Lucknow n's College was subsequently changed to f. Isabella Thoburn Woman's College. It Thoburn, Bishop J. M., 'Life of Is-
thoburn.'

OBURN, James Mills, American dist Episcopalian bishop: b. Saint Clairsville, Ohio, 7 March 1836. He was graduated eghney College, Meadville, Pa., in 1857, son after entering the ministry. In 1859 s ent as a missionary to India and until when he retired, was identified with work in region. He was elected bishop of India alasia in 1888 and was for six years the of the Indian Episcopalian Church. His writings in 'Missionary Addresses' (1887); 'India alasia' (1893); 'The Deaconess and Vocation' (1893); 'Christless Nations'; 'The Church of Pentecost' (1901); isabella Thoburn' (1903) and 'The lan Conquest of India.'

OBURN, Joseph, American soldier: rickergus, Ireland, 20 April 1825; d. Creek, 19 Oct. 1864. In August follow-
s parents emigrated to America, settling arm in Belmont County, Ohio. His edu-

cation was obtained in the primitive rural schools of the period, supplemented by diligent private study. He became a teacher in the public schools at the age of 17 and later, having advanced to the principalship of a village school, he began the study of medicine. He was graduated from Starling Medical College, Columbus, Ohio, in 1850. After a year as an interne in hospital service, he located for the practice of his profession at Wheel-
ing, (West) Va. At the outbreak of the Civil War he was commissioned surgeon of the first regiment raised in Virginia for the Union service. At the battle of Philippi, its colonel (Benjamin F. Kelley) was seriously wounded and, the other field officers not being available for duty, the command of the regiment dev-
ved upon the surgeon, who continued to act in that capacity until the expiration of its 100-
day term of service. When the regiment re-
enlisted for three years he was commissioned as its colonel. After a year of service as a regimental commander, he was assigned to the command of the Fourth Brigade, Fifredi-
y of the Methodist Episcopal Church, as selected as its first missionary, being ed to work in India, whither her brother, M. Thoburn (q.v.), had gone 10 years . In April 1870, she organized a school tive girls at Lucknow with but six pupils erself as the only teacher. She also en- evangelistic, Sunday school and zemana. The grade of the school thus established rapidly raised as its attendance increased. a full high school course was offered. in response to a demand for still more ad- l courses of instruction, classes in the collegiate grades were offered in 1887 n 1895, after having complied with the requirements of the British Indian gov-
ent, it was granted a charter as the Luck-
Woman's College. Climatic conditions, seriously impaired her health, necess-
several extended furloughs, the years 2, 1890-90 and 1890-90 being spent in ca, though they were years filled with y in behalf of the cause to which her lite ven devoted. s parents emigrated to America, settling arm in Belmont County, Ohio. His edu-

THOBURN, Joseph Bradford, American writer: b. Bellaire, Ohio, 8 Aug. 1866. In 1871 his parents removed to Marion County, Kan., where he was reared on a farm and at-
tended the public schools. He learned the printer's trade and did some newspaper work, after which he entered the Kansas Agricultural College from which he was graduated in 1893. In 1899 he removed to Oklahoma City, where he engaged in newspaper work. He served as secretary of the Oklahoma Territorial Board of Agriculture from December 1902 until July 1905. Since 1907 he has devoted himself largely to the work of research and writing along the lines of local and western history.
From 1913 to 1917 he was connected with the University of Oklahoma as a specialist in research, field-work and collections in local history. During this time he did considerable work in the way of excavating prehistoric earth-works, cave dwellings, tumuli, etc., in Oklahoma. In the course of these investigations he secured positive evidence that the natural mounds, so-called, which are so often pointed out as remains of an immediately west of the lower half of the valley of the Mississippi, the origin of which had long been a subject of dispute among scientists, are of human origin, each tumulus, so far as examined, proving to be the mound of a timber-framed, dassenhaard, earth-covered human habitation. He has been in the service of the Oklahoma Historical Society since July 1917, being engaged in research, field collections and editorial work. He is the author of a comprehensive history of Oklahoma, published in 1916.

THOLEN, tō’lən, Netherlands, an island in the province of Zeeland, north of the Ooster Schelde and 21 miles northwest of Antwerp, contains 47 square miles. It is protected by dykes, of which the principal products are wheat, rye, barley, oats, flax, madder, beans and potatoes. Tholen is also the name of the chief town. Pop. 3,254.

THOM, tōm, James, Scottish sculptor: b. Ayrshire, Scotland, 1799; d. New York, 17 April 1850. He was by trade a stonemason and suddenly leaped into notice by his group "Tam o’ Shanter and Souter Johnny," cut in the sandstone on which he was accustomed to work. This group now forms part of the Burns monument at Doon, near Ayr. It was first exhibited in Edinburgh (1828) and by its success the sculptor was led to move to London, but in 1837 sailed for the United States, where his genius found at last a liberal recognition. Among his best known works is "Old Mortality," now in Laurel Hill Cemetery, Philadelphia, of which he was induced to make many replicas.

THOMA, tō’ma, Ludwig, German satiric novelist and dramatist: b. Oberammergau, 21 Jan. 1867. He attended gymnasium at Munich and Landshut, the Forestry School at Aschaffenburg in order to study law, the universities of Munich and Erlangen, thus obtaining his entire education in Bavaria. For a short time he practised law at Dachau, later at Munich (1897-98), soon relinquishing this career for that of literature. The general tone of his literary work is well indicated by the fact that he has been connected with the humorous and oppositional weekly Simplicissimus (q.v.) at Munich, as editor, since 1899. März, a more serious periodical (bi-monthly), has also for a time been under his editorship. The cartoons and quips of Simplicissimus were one of the mainstays of the German liberals in their fight with the Imperial Government, and it was one of the great disappointments of 1914 to behold the paper assume a more and more chauvinistic attitude after the events of August in that year, supporting the predatory and imperialistic policy of the German government where resistance would have been the proper attitude of a liberal organ. Thoma’s own attitude was similar to that of the great wave of chauvinism which the government had efficiently launched, he took part in the patriotic shouting, and incidentally engaged in polemic correspondence with a number of American writers, including GEORGE HAYE, Putnam, who published some of their interchanges of views in a book. But Thoma is too critical and subtle a man to become a chauvinist of the worst type. His literary work, his opposition is directed against petty social prejudices and, in the political field, to the Roman Catholic Church; in the latter respect he resembles AUERBACHER, and ROSENGGERER (q.v.), both of whom, like THOMA, bitterly attack the abuses of the papacy, not from a Protestant standpoint, but from the usual hostile position of the Roman Catholic countries. The most notable sat on the clergy are the short story "Der heilige Hieß" (Munich 1904), and the bitter novel Drews Vöst (ib. 1905, 13th ed., 1910). Three best plays, which are very popular on German stages, are "Die Lokaalbank," a com (1902), "Morals," comedy (1909), and "Magdalen," a popular tragedy ("Volkstuck," 1908). Each has as its theme one of theacies of provincial life. "Die Lokaalbank" pictures the career of a group of government officials, who never achieve any real "Morals" reveals the low morality of a group of persons who have joined a society for the uplift in order to be the more effective cloaked from each other; "Magdalen" is story of a girl's gradual shifting from the life that is frank and unselfish, and who therefore, meets with no disapproval from villagers, to one that is governed by considerations of money, thus causing her ostracism and death. No man has better depicted the life the small peasant and country townsman, Bavaria than has Thoma.

THOMAS, Saint, also called DIDO (Tomus being the Aramaic, Didymos Greek word signifying "twin"); of one of the Twelve Apostles known as THE DONO such a twin brother of a sister Lysias, children Diophanes and Rhoa. This Thomas is said to have been a native of Antioch, twin brother of a sister Lysias, children Diophanes and Rhoa. Eusebius implies that he was a stepbrother of Jesus and that his real name was Judas. The scene in the Gospel in which the doubts were raised as to whether Thomas had expressed with enthusiasm as to the fact of the resurrection is the chief of the three occasions on which he is prominent (consul to John xx., 24-29; Let xxiv, 1-11); in which the doubts were raised as to whether Thomas had expressed with enthusiasm as to the fact of the resurrection is the chief of the three occasions on which he is prominent (consul to John xx., 24-29; Let xxiv, 1-11); in which the doubts were raised as to whether Thomas had expressed with enthusiasm as to the fact of the resurrection is the chief of the three occasions on which he is prominent (consul to John xx., 24-29; Let xxiv, 1-11); in which the doubts were raised as to whether Thomas had expressed with enthusiasm as to the fact of the resurrection is the chief of the three occasions on which he is prominent (consul to John xx., 24-29; Let xxiv, 1-11);
Thomas, Augustus, American playwright: b. Saint Louis, Mo., 8 Jan. 1859. He was a special writer and illustrator on Saint Louis, Kansas City and New York newspapers, and became editor and proprietor of the Kansas City Mirror in 1889. He soon left the field of journalism and became a playwright. He is the author of the popular dramas, 'Arizona,' 'In Mizzoura,' 'The Burglar,' 'The Man Upstairs,' 'On the Quiet,' 'The Earl of Pawtucket,' 'The Other Girl,' 'Mrs. Leffingwell's His Boots,' 'The Education of Mr. Pipp,' 'Jim Delancy,' 'The Embassy Ball,' 'The Witching Hour,' 'The Harvest Moon,' 'As a Man Thinks,' 'Indian Summer,' 'That Overcoat,' 'The Hoosier Doctor,' 'The Rio Grande,' 'The Copperhead,' etc. He is a member of the American Academy of Arts and Letters, and of the National Institute of Arts and Letters, of which he became president in 1914, and from which he received a gold medal for his services to the drama. In 1914 he received the degree of A.M. from Williams College.

Thomas, Becket. See Becket, Thomas.

Thomas, Calvin, American college professor: b. near Lapeer, Mich., 28 Oct. 1854; d. New York, 4 Nov. 1919. He was graduated at the University of Michigan in 1874, taking his A.B. degree the same year and the degree of LL.D. in 1904. He taught Latin and Greek at the Grand Rapids High School for a while, after which he studied philology at Leipzig in 1877-78. Following this course he devoted himself to the teaching of German, and was professor of that language at Columbia University. He edited a number of the standard German classics for school and college use and wrote extensively on philological subjects for educational and literary publications, besides assisting in the compilation of the New Standard Dictionary. In 1909 he edited an 'Anthology of German literature.'

Thomas, Charles Spaulding, American lawyer and politician: b. Darien, Ga., Dec. 6, 1849. He removed his family to Michigan in his youth, and was educated in the State university, taking his LL.D. there 1871. He practised law in Colorado, and was chairman of the Democratic national convention in 1880. From 1899-1901 he was governor of Colorado, and in 1913 was chosen United States Senator to fill the unexpired term of Charles J. Hughes, deceased. He was re-elected for the term 1913-21.

Thomas, Cyrus, American archaeologist and entomologist: b. Kingsport, Tenn., 27 July 1825; d. 1910. He was admitted to the bar in
1851 and practised law for several years, finally entering the Lutheran ministry in 1864. He was naturalist on the United States Geological Survey, 1869-74, and professor of natural sciences in the Southern Illinois Normal University, 1874-77. He was State entomologist of Illinois 1875-82, and in 1882 he became ethnologist in the United States bureau of ethnology in Washington, D.C., on account of his explorations. Of special interest in this latter line are his 'Studies of the Manuscript Troano' (1882); 'Notes on Certain Maya and Mexican Manuscripts' (1884); 'Mound Exploration' (1888); 'Prehistoric Works East of the Rocky Mountains'; 'Indians of North America in Historic Times' (with W. J. McGee 1903).

THOMAS, Edith Matilda, American poet: b. Chatham, Ohio, 12 Aug., 1854. She was educated at the State Normal School, Geneva, Ohio. Much of her verse is distinctly above the average, displaying not only very subtle feeling, but great delicacy of expression. She contributed to many periodicals and published in book form 'A New Year's Masque, etc.' (1885); 'The Round Year' (1886); 'Lyrics and Legends' (1890); 'Fair Shadow Land' (1893); 'In Sunshine Land' (1895); 'In the Young World' (1895); 'A Winter Swallow and Other Verse' (1896); 'The Dancers' (1903); 'Cassian and Other Verses' (1910); 'The Great at the Gates' (verse, 1909); 'The White Messenger'; 'The Flower from the Ashes' (1915).

THOMAS, George Henry, American soldier: b. Southampton County, Va., 31 July 1816; d. San Francisco, Cal., 28 March 1897. On his father's side he was of Welsh and English ancestry. His mother was of Huguenot descent. He received this early education at Southampton Academy, near his home, and soon after his graduation was appointed to a cadetship at the West Point Military Academy, by the Hon. John Y. Mason, member of Congress from the Southampton district. He was graduated at West Point in 1840, standing 12th in a class of 42 members, W. T. Sherman being sixth. He was a thoughtful and industrious student at the academy, a characteristic which followed him throughout his later military career. In 1840 he was appointed lieutenant in the Third artillery. He served in the war against the Seminoles in Florida, and later in the Mexican War, and was brevetted captain and major for meritorious services. at Monterey and Buena Vista. He was instructor at the Military Academy in 1851-54. In 1852 he was united in marriage with Miss Frances Kellogg of Troy, N. Y. He was commissioned major of the 5th cavalry not long after he joined, and for some years saw duty on the western frontier, and engaged in campaigning against hostile Indians.

Upon the breaking out of the Civil War he rejoined the cause of the Union, and was appointed brigadier-general of United States Volunteers. It has been stated that early in 1864, during the period of suspense and uncertainty that preceded the war, he was wavering in his loyalty to the government, and that he applied to the President for his release from the army. No evidence on this point exists. He was early made major-general of volunteers and was placed in command of the first division of the Union army in Kentucky. On May 1862, he won the first important victory by the government forces in the west, defeating the Confederates under G. Z. Biddle, at the battle of Mill Springs, Kentucky, and was promoted to the rank of major-general of volunteers and thanked President Lincoln in a complimentary address for the victory. At the battle of Stone River (q.v.), near Murfreesboro, his command repelled the enemy, reinforced the Union line, where he gave additional evide of his abilities as a commander, and of his qualities as a fighter. At the battle of Tamaqua (q.v.), in September 1863, commanded the 14th corps composed of divisions of Rector's army, and at the end of the engagement on 20 September he held the left of the general line, and successfully resisted the repeated attacks of the Confederates. About noon the right wing of the army was weakened by the withdrawal of troops to meet Thomas' left flank, and the assaults of Hood and Longstreet. The right of the army was routed, but Thomas reformed his troops on the Snodgrass Hill, and with the reinforcements brought forward by Gen. Gordon Granger, and other detachments, checked the onslaught of the victorious Confederates, repelled their repeated attacks, held the position until nightfall, when he withdrew his forces to Rossville. His defeat at Snodgrass Hill was one of the most ominous events and one of the darkest struggles of the Civil War. He fairly wore the title of the "Rock of Chickamauga," by which he is so well known.

In the engagement of November 1863, at the front of Chattanooga (q.v.), General Thomas, with the 1st corps, stormed the heights of Missionary Ridge and drove General Bragg's army from its strong position on the crest, gaining a complete victory over the Confederates. In the campaign against Atlanta (q.v.) in 1864 Thomas was second in command under Sherman, and ably co-operated with that soldier in accomplishing the brilliant series of successes achieved by the Union army. General Sherman left Atlanta and marched his army through Georgia to the sea. Gen. Thomas took command of the Federal forces remaining in Georgia, Alabama and the Carolinas and prepared to meet the Confederates under General Hood, then threatening the advance into Tennessee. General Thomas began the concentration of his forces in Nashville (q.v.). His troops under Schofield stayed Hood's advance at Nashville, and inflicted terrible losses on the Confederates, but Hood soon appeared at Nashville and threatened to attack. General Thomas was soon transferred to Vicksburg, and placed in charge of Smith's command from Missouri. He was forced by cavalry under Gen. J. H. S. M. He was forced by cavalry under Gen. J. H. Stoneman's command from Missouri. The time was needed for equipping the cavalry, organizing the troops. Severe winter had set in, and the troops were covered with ice and sleet — thus the military operations. Meantime the army at Washington became impatient at.
dered Thomas to attack Hood. General as explained and remonstrated, and took me by these results, fully seduced his fore they could be executed he attacked s army and gained one of the most com- und brilliant victories of the war, routing m dispersing Hood's forces. General as, the close of the war he was in command Department of the Cumberland at Nash- and was most useful in reorganizing and uing the civil laws and government in ssee and the adjacent States. His high a character, executive ability and good ent were instrumental in establishing and good order throughout that section. 1. Thomas must be credited with a very order of military ability, and a most hon- place in the history of the Civil War. 2. no serious military mistakes, and can ured with no defeats.

After the closing of the war he was as- to the command of the Military Division Pacifc, with headquarters at San Fran- where he died. His wife survived him few years. They had no children. Con- oppee, Henry, 'Life of General Thomas' York 1893); Bradford, Gamaliel, 'Union its' (Boston 1916); Van Horne, T. B., of Major-General G. H. Thomas' (New 1882).

OMAS, George Housman, English utor and engraver: b. 7 Dec. 1824; d. ne, France, 21 July 1868. He began life apprentice to a wood engraver, and prac- hat art in Paris, but gave the greater part time to book illustration, in which he very proficient. He lived in the United in 1846-47, and made designs for 'Mansion'. After his return to England he became ian on the 'Illustrated London News'. otabe pictures are 'The Queen Giving 1 to Crimean Heroes,' and 'The Queen rince Albert at Aldershot.'

OMAS, Isaiah, American printer and ilder: b. Boston, 19 Jan. 1749; d. Worces- April 1831. He was apprenticed to aiah Fowkes, a Boston printer, with whom published the 'Massachusetts Spy,' of which n became sole proprietor. So bold were hig-editorials that in 1771 he was sum- to appear for alleged sedition. He re- and the attorney-general, when ordered secute, failed to obtain a bill of indict- rom the grand jury. After participation skirmish at Lexington, he continued the tion of the 'Spy' at Worcester, where it ter appeared with the exception of a brief in 1770-71. In 1788 he opened a book- Boston, with branches in various parts United States. Among his publications Massachusetts Magazine (8 vols. s); a folio Bible (1791); and several edit- of 'Pennsylvania.' He was under (1812), first president, and most patron of the American Antiquarian. He published a 'History of Printing,' which contains much valuable mate- rial. This was reprinted in 1874 by the Anti- quarian Society. Consult Lincoln, 'History of Worcester' (1837); Hill, 'History of Isaiah Thomas' (Boston 1874); Hill (in Antiquarian Society 'Transactions,' Vols. IX and X, Worcester 1909).

THOMAS, Jesse Burgess, American Baptist clergyman: b. Edwardsville, Ill., 29 July 1832; d. June 1915. He was graduated from Kenyon College in 1850, and practised law in Chicago 1857-62. He was pastor of the First Baptist Church, Brooklyn, 1864-69, of the Michigan Avenue Baptist Church, Chicago, 1869-74, and from 1874-88 was pastor of the First Church, San Francisco. From 1888 he was professor of church history at the Newton Theological Seminary. He published 'The Old Bible and the New Science'; 'The Mould of Doctrine,' etc.

THOMAS, John, American physician and soldier: b. Marshfield, Mass., 1725; d. Chambly, province of Quebec, 22 June 1776. He was sent as surgeon to the army in Nova Scotia in 1746; was on the medical staff of General Shirley's regiment in 1747; but secured an appointment as lieutenant in 1759. In 1760, while commanding a regiment under Amherst, he was engaged in operations against the French at Lake Champlain and at Montreal. He was a delegate to the Massachusetts provincial con- gress 1774-75 and having, during the Revolution raised a regiment of volunteers, was appointed brigadier-general. He took part in the siege of Boston; forced the British to evacuate Dor- chester; and participated in the Canadian campaign.

THOMAS, John Jacob, American writer on agricultural topics and authority on horticulture: b. near Lake Cayuga, 1810; d. 1895. He became widely known for editorial work and was a recognized authority on farm topics. His best known publication is 'The American Fruit Culturist' (1845), the twenty-first edition of which was reprinted in 1899. He also issued a book on 'Farm Implements and Machinery' (1869) and a work on the 'Rutabaga' (9 vols., 1855-81); writings greatly valued in his day.

THOMAS, Joseph, American lexicographer: b. Cayuga County, N. Y., 23 Sept. 1811; d. Philadelphia, 24 Dec. 1891. He was educated at Rensselaer Polytechnic Institute, Troy, N. Y., and at Yale, was graduated in medicine at Philadelphia, and engaged in practice there. He was in India in 1857-58, where he made a study of Oriental languages and later spent four months in Egypt in the study of Arabic. He was subsequently professor of Latin and Greek at Haverford College, Pennsylvania. He was associate editor with Thomas Baldwin of 'A Pronouncing Gazetteer' (1845), which was revised and published as 'A Complete Pronouncing Geographical Dictionary of the World' (1855); 'A New and Complete Gazetteer of the United States' (1854), etc. He also wrote 'A First Book of Etymology' (1851-52); 'Travels in Egypt and Palestine' (1853); 'A Comprehensive Medical Dictionary' (1864; rev. ed., 1886); 'Universal Pronouncing Dictionary of Biography and Mythology' (1870-71; 3d ed., rev., 1905); and other works.
He contributed the pronouncing vocabulary of proper names to 'Webster's Unabridged Dictionary.'

**THOMAS, Kempis.** See KEMPIS, THOMAS A.

**THOMAS, Lorenzo,** American soldier; b. Newcastle, Del., 26 Oct. 1804; d. Washington, D. C., 2 March 1875. He was graduated from the United States Military Academy in 1823. At the organization of the Adjutant-Generals Department he received a major's commission and served as chief of staff of the army in Florida (1839-40) and in the same capacity on the staff of General Butler during the Mexican War. In 1861 he became brigadier-general of the army and was retired from active service in 1869. He was named Secretary of War by President Johnson in 1868, but did not take office because of the refusal of Stanton to vacate.

**THOMAS, Martha Carey,** American woman educator and writer; b. Baltimore, Ohio, 2 Apr. 1857. She was educated at Cornell University, where she was graduated in 1877; studied in Johns Hopkins and Leipzig and took the Ph.D. degree at the University of Zurich in 1883. The Western University of Pennsylvania and Brown University have conferred upon her the honorary degree of LL.D. She taught English branches in Bryan Mawr College of which she was chosen president in 1895. She also was elected a trustee of Cornell University. She has published 'Sir Gawayne and the Green Knight' (1885); 'The Education of Women' (1900), and many articles on the higher education of women contributed to standard magazines. Mrs. Mary Garret, a benefactress of Bryan Mawr, left her for educational uses $15,000,000.

**THOMAS, Seth,** American manufacturer; b. Plymouth Hollow (now Thomson, Conn.), 1 Dec. 1816; d. there, 28 April 1888. He was the son of Seth Thomas (1780-1859), in whose honor Thomson was named and who began the manufacture of metal-movement clocks. The younger Thomas assumed the business, introducing his clocks throughout the world. He manufactured all sorts of timepieces.

**THOMAS, Theodore,** American musician; b. Esens, East Friesland, 11 Oct. 1835; d. Chicago, Ill., 4 Jan. 1905. He played the violin in public at the age of six and when only 10 made his first public appearance in New York. In his early concert and operatic engagements he appeared with Jenny Lind, Sontag, Grist and Mario. During 1855-69 he was associated with Mosenthal, Bergmann, Matzka, Berger and William Mason in successive seasons of chamber-music concerts. In 1864, having organized the orchestra which long went under his name, he began his symphony concerts in New York. These were continued, excepting the interval from 1869 to 1872, until 1878, when he went to Cincinnati to become director of the College of Music. With an orchestra, sometimes of 40 and later enlarged to 60 pieces, he visited the large cities of the East and West, giving concerts of both popular and classical music and always given to the development of musical taste. With his name were associated the biennial musical festivals held in Cincinnati from 1873 to 1898. Festivals of similar character were held under his direction in Chicago in 1882 and 1884 and in New York in 1882. As early as 1862 he was appointed conductor of the Brooklyn Philharmonic Society; when the New York Philharmonic Society was organized he was chosen its leader, and both positions he retained until 1891 when he made his residence in Chicago and became leader of the permanent orchestra in that city. In 1893 he was appointed musical director of the World's Columbian Exposition. Consult Thomas, Rose Fay, 'Mountain Garden' (New York 1904; new ed. 1915) and Upton, G. F. (editor), 'Theodore Thomas: A Musical Autobiography' (2 vols. Chicago 1905).

**THOMAS, Theodore Gaillard,** American physician; b. Edisto Island, S. C., 21 Nov. 1831. He was educated at Charleston College and was graduated as a physician in 1854. Speedily moving to New York where he served in Bellevue Hospital and became professor of diseases of women in The College of Physicians and Surgeons. He also was surgeon in the Women's Hospital and consulting physician to the Children's Hospital and Hospital of Brooklyn. He was a distinguished gynecologist and president of the American Society of Gynecologists; honorary member of the London Obstetrical Society and correspon
ding secretary of the Obstetrical Society of Berlin. He performed the first ovariotomy in the United States and published an account of it in 1870. His work on the Dis
cases of Women (Philadelphia 1868) ran in six editions and was translated into the modern languages, including the Chinese.

**THOMAS, William Henry Griffith,** English theologian; b. England, 1861. He was educated at King's College, London, and Christ Church, Oxford, and was ordained a priest of the Church of England in 1885. From 1890 to 1905 he was vicar of Saint Paul's, Londo
principal of Wyckcliffe Hall, Oxford, 1905-9 and was appointed professor of Old Testament the
ology at Wyckcliffe College, Toronto, 1910. He is author of Methods of Biblical Study (1902); A Commentary on Genesis (1906-07); 'The Power of Prayer' (1906); Christianity in Christ' (1909); 'A Commentary on Romans' (3 vols., 1911-12); 'Work and the Ministry' (1911); 'The Prayers of St. Paul' (1914), etc.

**THOMAS, William Widgery,** American Ambassador; b. Portland, Me., 26 Aug. 1807. He was graduated at Bowdoin College in 1829 and in 1862 became bearer of dispatches for the government of the United States. He served in Turkey; became vice-consul-general at Constantinople and subsequently was appointed acting consul at Galatz, Moldavia, a war-consul at Gothenburg, Sweden. In 1862 he resigned and in the following year was a sworn to the Maine bar. In 1869 Mr. Thomas was made commissioner of public lands for the State of Maine and in 1870-73 served as such. He was ambassador to Sweden, returning to America, where he was appointed minister to Sweden, and in 1889-94 and 1897-1905 served as consul in Norway and in 1889-94 and 1897-1905 served as envoy extraordinary and minister plenipotentiary to Sweden and Norway. In 1873-75...
improved methods of study into various departments of learning and as a jurist took a firm stand against trial by torture and witchcraft. He wrote 'History of Wisdom and Folly' (3 vols., 1693); 'Thoughts and Reminiscences' (1723–26); and other important works. Consult works concerning him by Luden (1865); Wagner (Berlin, 1872); Nicoladini (ib. 1888); Kayser (Hamburg 1900); also White, A. D., 'Seven Great Statesmen in the Warfare of Humanity with Unreason' (New York 1910).

THOMAS, W. Va., city, situated in the northwestern part of the state, on the Kanawha River, 12 miles southwest of Charleston. It is a manufacturing center, and is noted for its coal, timber, and iron deposits. It is served by the Chesapeake and Ohio Railroad. The population was 2,826 in 1930.

THOMAS, Gottfried, German theologian and writer, b. Egenhausen, Württemberg, 1802; d. 1875. He was educated at Halle and Berlin and occupied the chair of theology at Erlangen University from 1842 until he died. He is author of 'Origines' (1837); 'Christi Person und Werke' (1852-61; 3d ed., 1889-88); 'Christlichen Dogmengeschichte' (1874-76; 2d ed., 1886-89) and various similar works. Consult von Stahlin, 'Löhe, Thomasius, Harless' (Leipzig 1887).

THOMASTON, Conn., town, in Litchfield County, on the New York, New Haven and Hartford Railroad, 10 miles north of Waterbury, on the Naugatuck River. It was built up by the noted clockmaker, Seth Thomas, who removed there in 1813 and established his business. The great clock for Independence Hall, Philadelphia, was made there in 1876. The town has clock and watch factories, a brass rolling mill and cutlery manufactures. Pop. about 4,500.

THOMASVILLE, tōm'əs-vil, Ga., town and county-seat of Thomas County, on the Atlantic, Birmingham and Atlantic, the Florida Central and the Atlantic Coast Line railroads; about 10 miles from the Georgia boundary and 35 miles south of Albany. It is in an agricultural and stock-raising region. The chief industrial establishments are cotton compresses, cigar factories and creameries. There is a large trade in cotton, pine, tobacco, wool, fruit, vegetables and grain. A branch of the State University, called the South Georgia Agricultural and Mechanical College, is located here. Other educational institutions are the Young Men's College for Women, founded in 1869, and the Vashon Industrial School for girls, supported by the Woman's Home Missionary Society of the Methodist Episcopal Church, South; a normal school for negroes; the graded schools and a public library. Thomasville was settled in the 19th century and received its present charter in 1889. Pop. 6,727.

THOMASVILLE, N. C., city in Davison County on the Southern and the Carolina and Yadkin railroads, 22 miles southeast of Greensboro. A Baptist orphanage is located here. The city has cotton mills, machine shops and furniture and woodworking factories and is growing. Pop. about 4,000.

THOMISM, tōm'izəm, one of the two great schools of scholasticism, the other being Scotism (q.v.). It derived its name from its founder, Saint Thomas Aquinas, the great Dominican doctor; while Thomism and Scotism are both scholastic in their fundamentals they differ in various conclusions and corollaries chiefly as follows: (1) on the nature of universals; (2) the principle of individuation; (3) the manner...
in which grace acts on the human will; (4) the proof of immortality of the soul; (5) freedom from original sin in the case of the mother of Christ; (6) the effects of the merits of the Incarnation; (7) certain points on the mode of the efficacy of the sacraments; (8) whether an action may be morally indifferent; (9) on the question of toleration. See AUGUSTAS, Thomas.

THOMPSON, Augustus Charles, American Congregational clergyman: b. Goshen, Conn., 30 April 1812; d. 1901. He was educated at Yale University, at Hartford Theological Seminary and at the University of Berlin. His ordination as a Congregational pastor at Roxbury, Mass., took place 27 July 1842. With the Rev. Dr. Rufus Anderson he visited India in 1854 with a deputation from the American Board of Missions and was delegate to the London Missionary Conference in 1858. He lectured at Andover Theological Seminary (1877-80), at Boston University (1882) and at Hartford Theological Seminary (1885-86). He is author of numerous memoirs including those of Mrs. A. J. Waters (1856) and Rev. Dr. A. W. Anderson (1880). His larger publications include 'Moravian Missions' (1882); 'Foreign Missions' (1889); 'Protestant Missions' (1894), and 'The Eielor Memorial' (1900). He also published translations in the Marathi and Tamil tongues.

THOMPSON, Benjamin, Count RUMFORD, American physicist: b. North Woburn, Mass., 26 March 1753; d. Auteuil, near Paris, 21 Aug. 1814. He entered a Salem counting-house in 1760, later was made major of New Hampshire militia, and became a wealthy man, but, charged with being a Tory, fled to Boston, where he was associated with the British officers. He went to England in 1776 as bearer of certain dispatches, and as a reward for his services obtained a situation in the Foreign Office under Lord George Germain. He became Under-Secretary for the Colonies in 1780, and was shortly afterward appointed lieutenant-colonel of the King's American dragoons. Returning to England in 1783, he retired to Harvard. In 1784 he was knighted and went to the Continent. Through the recommendation of the Prince of Zweibrücken (afterward king of Bavaria) various writers of knighthood, was made a lieutenant-general and created count of the Holy Roman Empire, choosing the title Count Rumford from the name of his wife's native town (now Concord, N. H.). He left Bavaria in 1795, and returned to England, where he employed himself in making experiments on the nature and application of heat and on other subjects of economical and philosophical research. He clearly recognized that heat is a mode of motion, and that by a given amount of mechanical work a definite amount of heat may be produced. Among the objects which engaged his attention was the search for a remedy for smoke chimneys, which at that time formed one of the greatest nuisances in the country; and he succeeded in discovering the principles upon which fireplaces and chimneys have since been constructed. He likewise suggested the plan and assisted in the formation of the Royal Institution, which led to other establishments of a similar description. In 1801 he removed to Paris, where he took up his residence, and, his wife being dead, he married the widow of the celebrated Laplace; but the union proved unfortunate and a separation was long took place. Count Rumford then retired to a country house at Auteuil, about four miles from Paris, and there devoted his time to the embellishment of his domain and to the cultivation of chemistry and experimental philosophy. His investigations respecting the strength of materials and the force of gunpowder led to considerable improvements in artillery, and he also made discoveries in connection with light and illumination. Count Rumford was also a means of extensive learning, but he was familiar with the discoveries and improvements of contemporary science, and the industry and perseverance with which he pursued his inquiries enabled him to make several additions to the knowledge of chemistry and practical philosophy. He was the founder and first recipient of the Rumford medal of the Royal Society, and also founder of the Rumford medal of the American Academy of Arts and Sciences, and of the Rumford professorship in Harvard University. His complete works, with a memoir by George F. Ellis, were published by the American Academy of Arts and Sciences (Boston 1870-75). Consult also Slosson, E. E., in 'Leading American Men of Science' (ed. by D. S. Jordan, New York 1910).

THOMPSON, Charles Miner, American editor and author: b. Montpelier, Vt., 24 March 1864. Following his graduation from Harvard in 1886 he became literary editor of the Boston Advertiser (1887-90); associate editor of the Youth's Companion (1890-1911) and later a part owner and editor of the editor of that journal. He is noted as a writer of stories for boys. His publications include 'The Nimble Dollar' (1895); 'The Calico Cat' (1908); 'An Army Mule' (1910).

THOMPSON, Daniel Greenleaf, American lawyer, psychological and sociological writer: b. Montpelier, Vt., 9 Feb. 1850; d. New York, 10 July 1897. He was graduated from Amherst and was admitted to the bar in New York in 1872 but devoted himself chiefly to sociological work. Amherst conferred on him the Ph.D. degree in 1894. He became noted as a controversial writer and is known chiefly for 'A System of Psychology' (2 vols., 1884); 'Religious Sentiments of the Human Mind' (1888); 'Social Progress' (1889); 'The Philosophy of Fiction in Literature' (1890), and 'Politics in Democracy' (1893). The latter publication was translated into the Dutch language.

THOMPSON, Daniel Pierce, American author, lecturer, lawyer and politician: b. Charlestown, Mass., 1 Oct 1795; d. Montpelier, Vt., 6 June 1845. He was educated at Middlebury College, where he was graduated in 1822. He began life as a private lawyer, in which he studied law and was admitted to the bar in 1825. He settled in Montpelier the following year, held various judicial offices from that time to 1835 when he was authorized by
THOMPSON

lature to compile the laws of Vermont to 1834 (1835) and was elected sec-
state (1853-55). He edited the Green n Freeman (1849-56) and proved a vol-
writer. His publications include 'The-2es of Timothy Peacock, Esq.' (1835),
on the Anti-Masonic agitation; 'May or the Money Diggers' (1835), a prize terward reprint in London; 'The Mountain Boys' (1840); 'The Rangers' Tales of the Green Mountains' (1856); 'Gaelic Guttery of the Trapper of Lake z' (1857); 'The Doomed Chief' founded on the story of King Philip, tales based on Revolutionary stories.

an unfinished novel, 'The Honest

THOMPSON, Elizabeth Rowell, America
philanthropist: b. Lyndon, Vt., 21 Feb. 1821; d. Littleton, N. H., 20 July 1899. She was married to Thomas Thompson, a Boston millionaire, in 1845, and during his life engaged with him in philanthropic work. On his death in 1869 she inherited the vast income from his estate, and continued her charitable labors. She was an advocate of temperance reform, wrote a tract, 'Figures of Hell,' which was widely read, and contributed large sums for the furtherance of the cause. She gave $10,000 for an investigation of yellow fever in the South, and purchased and presented to Congress Carpenter's painting, 'Signing of the Emancipation Proclamation by President Lincoln in the Presence of his Cabinet.' She invested more than $100,000 in establishing head offices for her business, founded the town of Long Mont, Kan., and gave to each colonist 640 acres of land and $300. She contributed to the purchase of the Vassar College telescope, and was a generous benefactor of the American Association for the Advancement of Science, of which she was made the first patron. She was stricken with paralysis in 1888 and was afterward unable to continue his philanthropic work. In 1891 she pronounced insane by a Kansas City court, and a curator was appointed to the charge of her property in Missouri. She left an estate appraised at $400,000 with no public bequests.

THOMPSON, Francis, English poet: b. Ashton, Lancashire, 1860; d. London, 13 Nov. 1907. He was the son of a Lancashire physician, was educated at Ushaw Roman Catholic College, near Durham, and studied medicine at Owens College, Manchester. He took no interest in medicine, and turning his attention to literary work he went to London. Here after a struggle with poverty and hardship for some five years his work was brought to the attention of Alice Meynell (q.v.) through whose assistance and that of her husband, Wilfred Meynell, Thompson soon achieved reputation as a poet, and his fame steadily increased. Truly an ascetic, he stood alone among contemporary poets both for purity of thought and beauty of expression. He contributed to the critical reviews and published 'Poems' (1893); 'Sister Songs' (1895), and 'New Poems' (1897). Of his prose works, published posthumously, may be mentioned 'Life of Saint Ignatius Loyola' (1909); 'A Renegade Poet, and Other Essays' (1910); 'Life of John Baptist de la Galle' (1911). Consult his 'Works' (3 vols., New York 1913); also Beacock, G. A., 'Francis Thompson' (Marburg 1912); Meynell, E., 'Life of Francis Thompson' (New York 1913); Rooker, K., 'Francis Thompson' (London 1913).

THOMPSON, George, English reformer: b. Liverpool, England, 18 June 1804; d. 7 Oct. 1878. He acquired notoriety during the agitation by lecturing in the British Colonies. His subsequent tour in the United States produced great excitement and caused President Jackson to denounce him in a mes-
o to Congress. He was a friend of Carri-
son, Whittier and others in the anti-slavery movement and visited America several times. His influence aided materially in preventing the recognition of the South by Great Britain during the Civil War. He also took a prominent part in the Anti-Corn Law League and the British India Association to secure better government for India; was a member of the British Parliamentary Reform Association, and was elected member of Parliament 1847-52.

THOMPSON, Sir Henry, English surgeon: b. Framlingham, Suffolk, 6 Aug. 1820; d. London, 18 April 1904. He was educated at University College, London, and was awarded the Jacksonian prize in 1852 for an essay on 'The Pathology and Treatment of Stricture of the Urethra,' and again in 1860 for an essay on 'The Healthy and Morbid Anatomy of the Prostate Gland.' In 1853 he became assistant surgeon to University College Hospital, surgeon 10 years later, professor of clinical surgery in 1860, and consulting surgeon in 1847. In 1884 he was professor of pathology and surgery in the Royal College of Surgeons. He received numerous honors from foreign countries, was knighted in 1867, and created a baronet in 1899. His works treat mostly of the urinary organs and their diseases, of cremation, and of diet. Among his books is mentioned 'Clinical Lectures on Diseases of the Urinary Organs' (8th ed., 1888); 'The Preventive Treatment of Calculus Disease' (1888); 'Tumors of the Bladder' (1894); 'Cremation, or the Treatment of the Body after Death' (1874); 'Modern Cremation, its History and Practice' (4th ed., 1901), in which he advocates the substitution of cremation for the present method of sepulture; 'On Food and Feeding' (11th ed., 1901). He was also an artist of note, a pupil of Alma Tadema and others, and exhibited pictures at the Royal Academy, the Salon and elsewhere.

THOMPSON, Jacob, American politician: b. Caswell County, N. C., 15 May 1810; d. Memphis, Tenn., 24 March 1888. He was graduated at the University of North Carolina in 1831, and studied law at Oxford and engaged in the practice of law in Chickasaw County, Miss., in 1835. He was a member of Congress in 1839-51, and opposed the Compromise of 1850 as not sufficiently favorable to the South. He was appointed Secretary of the Interior by President Buchanan in 1857, and in December 1860, while still holding that office, he was appointed a commissioner from Mississippi to urge upon North Carolina the adoption of a secession ordinance. In January 1861 he resigned from the Cabinet in consequence of the action of President Buchanan in sending reinforcements to Fort Sumpter, which he declared to be a violation of an understanding with the Cabinet that the order should not be given without the knowledge of that body. He took an active part in the subsequent secession movement, was governor of Mississippi in 1862-64 and later served as aide to General Beauregard and inspector-general for the Department of Mississippi. He was Confederate commissioner to Canada in 1864, and a promoter of the邕aimiled law and coin engineering at Crawfordsville. Out-door life was his passion, and in 1885 he was State geologist of Indiana and chief of the Department of Natural History. In 1890 he joined the staff of the New York Independent. His books are the record of observations of a nature lover rather than a scientist, the product of his trips to the land and swamp regions of Florida and Louisiana, and to the hills of Alabama, Mississippi, and Georgia. He was a member of a hunting party, with which he huntedt instead of a gun. He wrote 'The Witchery of Archery' (1886); 'His Second Campaign' (1882); 'By-Ways and Bird Notes' (1885); 'The Boy's Book of Sports' (1886); 'Sylvan Secrets' (1887); 'Pest' (1892); 'The Ocala Boy' (1892); 'My Old Garden' (1900); 'Alice of Old Virginia' (1900).

THOMPSON, Sir John David, Canadian jurist and for some time Premier of the Dominion: b. Halifax, 10 Nov. 1844; d. Windsor, England, 12 Dec. 1884. He was the son of a family who had come from Waterford, Ireland, the office of queen's printer. Thompson attended the common school, Halifax, was called to the bar in that city in 1865, joined the Roman Catholic Church in 1866, and was created a baronet in 1874. In 1875, he was appointed to the Nova Scotia assembly for Anson in 1877. He was attorney-general in 1878 and premier the province in 1879. After the defeat of government in the same year Thompson was made a judge of the Supreme Court of Nova Scotia. This position he resigned to accept the portfolio of Minister of Justice in Sir John A. Macdonald's Cabinet (1882), entered the Dominion Parliament as member for Antigonish. He remained Minister of Justice until 1889, distinguishing himself by his oratorical power in the unruly industry. In 1887 he visited Washington as one of the commissioners at the fisheries question. The honor of knighthood was conferred on him in August 1888. John again visited Washington as one of the representatives of his government in the unsuccessful reciprocal negotiations of 1889-92. He was understood to have offered the position of Premier on the death of Sir John A. Macdonald (1891), but prefered to remain as Minister of Justice under leadership of Sir J. J. C. Abbott. On the retirement of the latter (December 1892), John Thompson became Prime Minister. Incessant Parliamentary labors rapidly undermined his health and brought about his sudden death immediately after the cabinet considered $1,200,000 for the construction of a new telegraph line to the United States. Sir John Thompson! (Toronto 1893).

THOMPSON, John Reuben, American journalist and poet: b. Richmond, Va., 26
30 Oct. 1873. He was graduated from University of Virginia in 1844; practised law in 1845, before entering into a career in journalism. In 1859 he edited the Literary Messenger to which Donald Hall contributed his "Reveries of a". His health caused his removal to Ga., where in 1859 he edited the Field magazine. Driven to London by the Civil War he actively defended the Confederacy in contributions to English and American newspapers. At the close of the war he returned to New York and became editor of the New York Post. He was author of several books which were popular at the time.

**Thompson, Joseph Parrish**, American novelist and Oriental scholar: b. Philadelphia, Pa.; d. Berlin, Germany, 27 Sept. 1879. He was educated at Yale College and graduated in 1838. He studied theology and was ordained Congregational minister. He was pastor of two churches in New York City. In 1857 he was appointed editor of the New York Post. He was author of several books, including "The Bible in America" (1856), "A Trysting Place" (1857), and "The Life of the Prophet" (1859). He was also a contributor to the New York Times and the Atlantic Monthly.

**Thompson, Richard Wigginton**, American lawyer: b. Culpeper County, Va., 9 June 1809; d. Terre Haute, Ind., 9 Feb. 1900. He was admitted to the bar of Lawrence County, Ind., in 1834. He served in both houses of the Congress of the United States, and in 1840 was elected to the Senate. He declined an appointment as Minister to Austria in 1849, and later the post of solicitor-general of the Land Office, which President Fillmore offered him. In 1867 he became judge of the Fifth Circuit Court, and in 1877-81 was Secretary of the Navy. He resigned this post before the completion of his term in order to become chairman of the American committee of the Panama Canal Company. He published "The Papacy and the Civil Power" (1877), "History of the Protective Tariff" (1888); "Footprints of the Jesuits" (1894) and "Recollections of Sixteen Presidents, from Washington to Lincoln" (1894).

**Thompson, Robert Ellis**, American educator: b. near Lurgan, Ireland, 5 April 1844. He was graduated at the University of Trinity College, Dublin, in 1865 and from 1865 to 1872 held successively in the chair of Latin and mathematics, social science, history and English literature. He has had lectureships in Harvard, Yale and Princeton Theological Seminary, and has contributed editorially to the "Penn Monthly", the "American, the Irish World and the Sunday School Times". In 1875 he was ordained to the Presbytery of Philadelphia. Since 1894 he has been principal of the Central High School of Philadelphia. His publications include "Social Science and National Economy" (1875); "De Civitate Dei" (1891), being his Stone lectures at Princeton; "History of the Presbyterian Churches of America" (1895); "Protection to Home Industry" (1885), being his Harvard lectures; "The Hand of God in American History" (1902); "The Historic Episcopate" (1903) and "The History of the Dwelling House and its Future" (1914). He has edited Duffield's "Latin Hymn-writers and Their Hymns" (1889); "Politic Economy for High Schools" (1895); "The Apostles as Everyday Men" (1912).

**Thompson, Silvanus Phillips**, English physicist: b. York, 19 June 1851; d. 1896. He was educated at Bootham School, York, at Flounders' Institute, Pontefract, and at the Royal School of Mines. In 1876-85 he held the professorship of experimental physics at University College, Bristol, and in 1885 became principal and professor of physics in the City and Guilds Technical College, Finsbury. He was president of the Physical Society; of the Institution of Electrical Engineers and of the Röntgen Society. His works include "Elementary Lessons in Electricity and Magnetism" (1881; rev. ed., 1915); "Dynamo-Electric Machinery" (1886); "Light, Visible and Invisible" (1897; 2d ed., 1910); "Michael Faraday" (1898); "The Life of Lord Kelvin" (1910).

THOMPSON, Vance, American journalist and playwright: b. 17 April 1863. He was graduated at Princeton in 1883, studied in Germany and was a dramatic critic in New York in 1890-97. His dramas include 'In Old Japan,' 'The Dresden She-Medics,' 'Floridan's Dream,' etc.; and among his books are 'French Portraits: Being Appreciations of the Writers of Young France' (1900); 'Dramatic Mysteries' (1905); 'The Spinners of Life'; 'Life and Letters of Ethelbert Nevin' (1913); 'The Night Watchman and Other Poems' (1914); 'The Ego Book' (1914); 'Eat and Grow Thin' (1914); 'Drink and be Sober' (1915); 'The Carnival of Destiny' (1916); 'The Peace Girl' (a romantic comedy drama) (1916); 'Women' (1917).

THOMPSON, Waddy, American lawyer: b. Pickensville, S. C., 8 Sept. 1798; d. Tallahassee, Fla., 23 Nov. 1868. He was graduated at the South Carolina College in 1814, admitted to the bar in 1819 and in 1826-30 served in the State legislature, became solicitor of the Western Circuit in 1830, was elected brigadier-general of militia at the time of the Nullification excitement and in 1835-41 was a Whig member of Congress. In 1840 he was chairman of the Committee on Military Affairs. He was appointed United States minister in 1842, and while on this mission concluded two important treaties and procured the liberation of more than 200 Texan prisoners. He published 'Recollections of Mexico' (1846).

THOMPSON, William, American Revolutionary officer: b. Ireland, about 1725; d. near Carlisle, Pa., 4 Sept. 1781. He served as captain of militia in the French and Indian War (1754-60) and was made colonel of eight Pennsylvania companies in June 1775. The following year he took the same rank in the Continental army and in 1778 became brigadier-general. He relieved Gen. Charles Lee at New York and in April led 14 regiments to Canada to re-enforce General Thomas, during whose illness he commanded until General Sullivan arrived. By the latter's orders he led an unsuccessful attack on the British at Trois Rivieres on 6 June and was captured but immediately paroled.

THOMPSON, William Hale, American mayor: b. Boston, Mass., 14 May 1849. In infancy he was removed to his parents in Chicago, where he was educated in the public schools. He spent five seasons on the ranches of the Standard Cattle Company in Colorado, Montana and Wyoming; was for three years manager of a cattle ranch in Nebraska. Since his marriage to Miss Thomas he has managed the real estate interests left by his father and other real estate interests of his own. In 1900-02 he served as alderman from the second ward of Chicago; in 1902-04 was county commissioner of Cook County and in 1915-19 was mayor of Chicago.

THOMPSON, William Horry, American lawyer and legislator: b. Granville, Ind., 14 Oct. 1871. The family moved to Illinois while he was a child and he was reared at the Seneca Normal School. He studied law and was admitted to the bar in 1894. He was elected judge of the Second Circuit Appeals (1906-13) and was elected as a delegate to the Democratic National Convention in 1912. He was elected senator in 1913. In 1916 he was a delegate to the Democratic National Convention.

THOMPSON, William Tappan, American newspaperman and humorist: b. Ravenna, 31 Aug. 1812; d. Savannah, Ga., 24 March 1880. He lived for a time in Philadelphia, worked on the Chronicle; afterward in New York, but died in San Francisco. He was a volunteer in the Seminole War (1835-36), and in 1848 was a member of the California Constitution. He was a contributor to the New York Mirror in Augusta, Ga., afterward to the New York World. He was a humorist in the effort at the New York World to make the New York Mirror in Augusta, Ga., afterward to the New York World. He was a humorist in the New York World. He was a humorist in the New York World. He was a humorist in the New York World. He was a humorist in the New York World. He was a humorist in the New York World. THOMPSON, Wordsworth, American artist: b. Baltimore, Md., 27 May 1840; d. Philadelphia, N. J., 28 Aug. 1896. He began to paint in New York, but made several trips abroad later in his life. He was a member of the Society of American Artists, the National Academy, and the Pennsylvania Academy of the Fine Arts. He was a member of the Society of American Artists. In 1876 he was a member of the Society of American Artists. In 1876 he was a member of the Society of American Artists. In 1876 he was a member of the Society of American Artists. In 1876 he was a member of the Society of American Artists.

THOMPSON, Conn., town in V welding, Quinebaug villages of Grosvener Dale, North Dale, New Boston, Thompson, East West Thompson, Wilsonville, Mecham Quinebaug. It is in an agricultural area of manufacturing establishments and the production of iron, steel and finished products, flour and macaroni, wool, hats and shoes factory. Thompson was originally a part of a larger town, but became a separate town in 1728, and its territory was incorporated as a town in 1824.
OMPSOM INDIANS. See SALISHAN.
OMPSOM'S STATION. Battle of. The battle of Stone River (q.v.) the Con-
eese River, occurred about 8 miles west of Roanoke's and near, and late in February 1863 Gen-
an Dorn, with over 6,000 men, crossed the Mississippi River and marched ar
to Columbus, on Duck River, threat-
franklin, about 28 miles nearly west of est,
March General Rose-
ordered a general reconnaissance in front
lines to ascertain the Confederate
and, if possible, the enemy's intention.
these reconnoitering columns was sent
Franklin. It was under command of Col.
Coburn and consisted of his brigade—
d 85th Indiana, 19th Michigan and 22d
— the 124th Ohio, 600 cavalry under
J. Jordan and Aleshire's Ohio battery
guns; in all 2,837 officers and men. A
101 wagons accompanied the expedition,
which were to collect forage. Coburn
struck to advance the first day to
Hill, where he was to halt for the night
the next day, with a wide
of it to Rally Hill, on the left, to meet
erating cavalry column from Murfrees-
clud, with the cavalry and the battery,
ance and when three miles out of Frank-
Gen. W. H. Jackson's cavalry division
brigades and King's battery moving
Brigades formed line for battle, A-
pedia with his guns, King's guns re-
he skirmishers became engaged, and
brisk engagement of an hour Jackson
w toward Spring Hill and Coburn went
four miles south of Franklin. One
fire's guns had been disabled and with
age train of 80 wagons, half of them
was sent back to Franklin. Van Dorn
from Columbus that morning with
brigades of Gen. W. B. Forest, W. T.
G. B. Cosby, F. C. Armstrong and Col.
Whitfield, 6,000 men and 12 guns, and
ackson with the two brigades of Ar-
and Whitfield fell back after the engage-
man commuted line for Thompson's
nine miles south of Franklin, and
Coburn's advance. Jackson's division
ned on a range of hills crossing the
pike, with King's battery on the ex-
and Forrest's brigade, with a battery,
Jackson's right. On the morning of the
urn advanced cautiously and on nearing
on's Station Jordan charged with his
drove a small Confederate force from
ion and seized a range of hills near it
of the battery, which was captured when, on entering a pass, with hills on
ide, he was arrested by shells from the
tillery on his right and left, en-
his line. It was necessary to dislodge
ad of the attack; Aleshire's guns on opposite
the turnpike and railroad which ran
each other, the guns supported by the
the 33d and 85th Indiana advanced
b hill against King's battery, when sud-
tly Confederate reinforcements behind a stone wall Whitfield's brigade,
reinforced by a regiment of Armstrong's,
opened a fire that drove the two regiments back
hill. Whitfield followed, and when
neering the summit he was charged and
be behind the depot of Thomp-
Station and with the assistance of two
King's guns compelled Coburn's men to fall
behind the hill. At about the same time
Coburn was informed that about 1,000 cavalry
had been discovered on the left and he
olved to retreat; but it was first necessary to check
the Confederate advance. The movement in
retreat was to be covered by the battery and
the cavalry, but when Jordan saw the signs of a
movement in retreat and the probability of be-
ing cut off by Forrest's cavalry on the left, he
ordered the wagon train and its guard to the
rear, to be followed by the battery. Jordan fol-
lowing the battery after a slight resistance to
Forrest. Meanwhile Armstrong and Whitfield
had been ordered to assault Coburn's left and
Forrest to reach his rear. Armstrong, Whit-
field and part of Forrest charged, and after a
fierce struggle for the crest of the hill were
again driven from it with great loss. Again the
Confederates charged; Coburn was forced
back; Forrest, with two regiments, gaining his
rear, charged him; and after a few volleys at
close quarters Coburn surrendered. His loss,
as officially reported, was 48 killed, 247 wounded,
and 1,151 captured or missing. Van Dorn's loss
was 56 killed, 289 wounded and 12 missing.
Meanwhile other columns had pushed out from
Murfreesboro and driven other bodies of Con-
federate cavalry across Duck River and Gen.
Gordon Granger, commanding the reserve corps
of Rosecrans' army, upon hearing of Coburn's
defeat, strengthened Franklin and concentrated
a column at that place to move upon Van Dorn,
at Spring Hill and Thompson's Station. Granger
moved on the 9th, attacked and drove
Armstrong's cavalry brigade from Thompson's
Station and advanced to Spring Hill, Van Dorn
having fallen back during the day to recross
Duck River at Columbia. On the next day
Granger's cavalry, pushed Armstrong across
Rutherford's Creek near Columbia; and Van
Dorn's main body recrossed Duck River. Pur-
suit was suspended and on the 11th the various
commands engaged in the general reconnois-
ance returned to their former positions.

Forrest.'

E. A. CARMAN.

THOMSON, tóm'són, Charles, American
patriot: b. Maghera, County Derry, Ireland, 29
Nov. 1729; d. Lower Merion, Pa., 16 Aug. 1824.
He came to America in 1740, was educated in
the academy at Thunder Hill, Md., and became
a teacher in the Friends' Academy, Newcaste,
Del, afterward taught in Philadelphia, and then
engaged in business in that city. He acted as
commissioner among the Indians and in 1756
was adopted into the Delaware tribe as the
'Truth Teller.' From the first he ardently es-
poused the cause of the colonies, and in 1774
was made secretary of the Continental Con-
gress, a post he occupied until 1789. Upon
Washington's election to the Presidency he was
sent to Mount Vernon to inform him of the
event. He then retired from public life and
afterward occupied himself with literary labors.
He published 'An Enquiry into the Causes of the Alienation of the Delaware and Shawanese Indians' (1759); 'The Holy Bible, containing the Old and New Covenant, translated from the Greek (the Old Covenant from the Septuagint)' (1808), and 'A Synopsis of the Four Evangelists' (1815). Consult Harley, 'The Life of Charles Thomson' (1900).

THOMSON, Sir Charles Wyville, Scottish naturalist: b. Bonsyde, Linlithgow, 5 March 1830; d. there, 10 March 1882. He was educated at the University of Edinburgh, where he took the medical course and showed great ability in botany and natural history. He was appointed lecturer on botany in King's College, Aberdeen, in 1850 and professor at Marischal College in 1851. He filled the chair of natural history in Queen's College, Cork, in 1853 and in 1854 went to Queen's College, Belfast, as professor of mineralogy and geology. In 1860 he was transferred to the chair of natural science in the same college and in 1868 became in addition professor of botany in the Royal College of Science at Dublin. He returned to Scotland in 1872 to become professor of natural history in the University of Edinburgh. He took an active part in the scientific investigation of the British seas by the Lightning and Porcupine expeditions and published 'The Life of the Sea' (1873). He was appointed in 1872 chief of the scientific staff of the Challenger Expedition (q.v.), and on its return in 1876 he knighted. In 'The Voyage of the Challenger: the Atlantic' (1877) he gave a general account of part of the investigations carried out on the famous voyage.

THOMSON, Edward, American Methodist Episcopal bishop: b. Portsea, England, 12 Oct. 1810; d. Wheeling, W. Va., 22 March 1870. He came to the United States in 1819, was graduated in medicine at the University of Pennsylvania in 1829 and practised in Jeromeville and Wooster, Ohio. In 1832 he united with the Methodist Church and in the following year was admitted into the Ohio Conference. He was pastor of a church in Detroit, Mich., in 1836 and in 1839 was called to the Normal Seminary. He was the first president of the Ohio Wesleyan University at Delaware, in 1846-60, and in 1864 he was elected bishop, in which office he continued until his death. He edited the Ladies Repository at Cincinnati 1844-46, the Christian Advocate and Journal, New York 1860-64, made a missionary tour of the world and published 'Moral and Religious Essays' (1856); 'Sketches, Biographical and Incidental' (1856); 'Our Oriental Missions' (1870); 'Evidences of Revealed Religion' (1872); and other works.

THOMSON, Edward William, American civil engineer and author: b. Toronto, Ont., 12 Feb. 1849. He was educated in Trinity College Grammar School and by his own exertions. When but 16 he enlisted and served in the 3rd and 4th Pennsylvania regiments; and in the Queen's Own Rifles in 1866. He became a political writer on the Toronto Globe (1859-91); was editor of the Youth's Companion, Boston (1859-1901), after having become a special writer on Canadian politics. He was also the traveling correspondent of the Evening Transcript, Boston. His published works include 'Old Man Savarin' (1899), 'Between Earth and Sky' (1897), 'Assassin and Nicaragua' (1895, versified from the translation); 'We Lincoln Died, and other poems' (1899), etc.

THOMSON, Elihu, American inventor and electrician: b. Manchester, England, 29 Mar. 1853. In 1858 he came to the United States, educated in the public schools in Philadelphia and from 1857 to 1858 was a professor of chemistry and mechanics in the Central High School. After a visit to the Paris Exposition 1858 he became interested in the subject of lighting by electricity and his experiments carried on with the aid of E. J. Houston, resulted in patents secured in 1878 and 1879. The following year he became electrician to the American Electric Company, afterward known as the Thomson-Houston Electric Company. By consolidation with the Edison Company 1892, became the General Electric Company, the largest plant for producing electrical machinery in the world. His patented inventions in electrical appliances number over 600, many of them have come into universal use. Among these are the three-phase alternator, the dynamo motors; the system of distribution; the induction motor; the constant-current regulator for arc-light; the process of welding metals; the electric battery; the magnetic blow-out for arc lamps and fuses and the electric meter for street lighting on alternating currents. Since 1892, when the General Electric Company established its plant at Lynn, Mass., he has resided there, retaining his connection as consulting electrical engineer.

In 1899 he became president of the American Institute of Electrical Engineers, and in 1899 received from the Paris commission half prize of 10,000 francs for his meter. He was decorated in 1889 for electrical inventions of the French government as Officier de la Legion d'Honneur; given the highest degrees of A.M., Yale, D.Sc., Harvard and P. Tufts; has received many medals and awards, among which is the Rumford Medal, and was awarded Grand Prix at Paris exhibitions 1886 and 1889. He is a fellow of American Institute of Electrical Engineers, Fellow of American Academy of Arts and Sciences, member of the Institution of Civil Engineers, London, the American Chemical Society, the American Physical Society, the National Academy of Sciences, the various societies, and was official United States delegate to the Chamber of Delegates, Electrical Congress in 1893 at Chicago. He has been for many years a Fellow of the American Association for the Advancement of Science, serving as vice-president at the Columbus meeting, section B, Physics; and has been vice-president of the American Physical Society. He was president of the International Electrical Congress at Saint Louis in 1904 and also president of the Chamber of Official Delegates at said Congress. He was elected honorary member of the Institution of Electrical Engineers of Great Britain in 1904. In 1909 he was eldest president of the International Electrical Commission, succeeding the late Lord Kelvin as such. In 1899 he was made a special writer on Canadian politics. He was also the traveling correspondent of the Evening Transcript, Boston. His published works include 'Old Man Savarin' (1899), 'Between Earth and Sky' (1897), 'Assassin and Nicaragua' (1895, versified from the translation); 'We Lincoln Died, and other poems' (1899), etc.

Beethoven, Mozart and others of note
by the deficiency and also to compose
ments for them. The results of his
en were as follows: Scottish airs
1793-1841); Welsh (3 vols., 1809-14),
sh (2 vols., 1814-16).
OMSON, James, Scottish poet: b. Ox-
boroughshire, 11 Sept. 1700; d. Rich-
, 27 Aug. 1748. He was educated
University of Edinburgh in 1715 and
 ended to enter the ministry, but in 1725
London to devote himself to literature.
 en on ‘Winter’ was published in the
year, in 1727 it was followed by
‘Spring’ appeared in 1728 and in
a series was completed and published
. It was very successful and
covered by his play ‘Sophonisba’.
 It Drury Lane in 1730. For two years
 on the Continent as traveling tutor to
Charles Talbot, afterward Lord Chas-
and in the death of his pupil in 1733,
pointed by the young man’s father to
ure office with a salary of £300 a year.
lished a patriotic poem entitled ‘Liberty’
6), included in 1736 in the volume with
; and ‘The Famous Rule Britannia,’
formed part of ‘The
of Alfred’ (1740), written by him with
and, David Mallet, to music composed
by Dr. Arne. In 1744 Lord Lyttelton conferred
upon him the sinecure office of surveyor-gen-
eral of the Leeward Islands, worth £300 a year.
In the same year he is mentioned in ‘The Seasons’ with extensive additions
and alterations, and in 1748 appeared ‘The Castle
of Indolence: An Allegorical Poem,’ a fine
imitation of Spenser. He was buried in the
parish church of Richmond. Among his works
not already mentioned are ‘The allegas’ (1738), a play; ‘Edward and Eleonora’ (1739),
a play which was published but rejected by the
censor; ‘Tancred and Sigismunda,’ a tragedy
(1745), his most successful play, and ‘Coriolanus’ (1749), a posthumously acted play. ‘The
Seasons’ marks the dawn of a new era in
English poetry, an era characterized by a
departure from the formation and artificiality of
Pope and his school in favor of simplicity and
ruthlessness to nature. The impulse gathered
strength in Gray and Cowper, and reached its
fullest expression in Wordsworth. The work
found warm admirers in France and other
countries and is still read. A good recent edition
of Thomson’s works is the ‘Aldine’ edition of
Tovey. (See SEASONS, THE.) Consult Morel,
L., ‘James Thomson, sa Vie et ses Œuvres’
(Paris 1895); ‘Life’ in Tovey’s edition; Bayne,
‘Thomson’ (‘Famous Scots Series,’ 1898); 
Macaulay, G. C., ‘James Thomson’ (New
York 1906).
THOMSON, James, British professor of
engineering: b. Belfast, 16 Feb. 1822; d. Glas-
gow, 8 May 1892. He was a brother of William
Thomson, Lord Kelvin, and was graduated
from the University of Glasgow in 1839. In
1851 he settled at Belfast as civil engineer and
in 1857 became Crown professor of civil engi-
eering at Queen’s College. Here he remained
until 1873, when he was called to the similar
chair at Glasgow. In early life he was devoted
to various inventive purposes, his first being
for the purposes of steamery paddles. More practical was his in-
vention in 1850 of a vortex water-wheel, and
later of a jet-pump used in draining lowlands,
a centrifugal pump and improvements in tur-
biners and in the action of turbines. For
many years he was engaged in investigations
of the plasticity of ice, his first contribution to
the subject (1848) being a paper communicated
to the Royal Society of Edinburgh on ‘The
Effect of Pressure in Lowering the Freezing
point of Water.’ The most important of his
contributions to this subject dealt with crys-
tallization and liquefaction as influenced by
pressures tending to change of form in crystals.
He also published researches on currents of
atmospheric circulation; on the flow of water
in rivers and on the jointed prismatic structure
seen at the Giants’ Causeway. Failure of eye-
sight caused him to resign his chair in 1889.
THOMSON, James, Scottish poet: b. Port-
Glasgow, 23 Nov. 1834; d. London, 3 June
1882. He was trained at Chelsea for the calling
of army schoolmaster and after teaching at
various regimental centres was discharged from
the army with several others for a breach of
discipline in 1862. He had gained the friend-
ship of Charles Bradlaugh (q.v.) and con-
tributed to his National Reformer over the
signature B. V. In 1872 he was in Colorado as
agent of a mining company and in the follow-

ing year went to Spain as a war correspondent for the New York World. In 1874 (March to May) he accompanied the National Reform Association; his most famous poem, ‘The City of Dreadful Night’ (printed in book form, with other poems, 1880), a finished, sombre work, in which his gloomy temperament clearly shows itself. His other works include ‘Vane’s Story’, ‘Weddah and Om-el-Bonain and other Poems’ (1881); ‘Essays and Phantasies’ (1881); ‘A Voice from the Nile and other Poems’ (1884); ‘Satières and Profanities’ (1884), and ‘Poems, Essays and Fragments’ (1892). His ‘Poetical Works’ were issued in two volumes in 1895 and a volume of ‘Biographical and Critical Studies’ appeared in 1896. (See City of Dreadful Night, The.) Consult the Life by Salt (1889; rev. ed., 1889); also Ward, English Poets (2d ed., Vol. IV, 1883).

THOMSON, John, Scottish painter: b. Dailly, Ayrshire, 1 Sept. 1778; d. Duddingston, 30 Oct. 1840. He studied for the ministry in Glasgow University for a year, in 1793 entered the University of Edinburgh and on his father’s death in 1799 succeeded him as minister of his native parish. In 1805 he was presented to the parish of Duddingston, near Edinburgh, and here he rapidly acquired fame as a landscape-painter and developed a close friendship with Sir Walter Scott. His pictures were much in demand and he exhibited frequently in Edinburgh. On the foundation of the Scottish Academy in 1830 he was elected an honorary member, after declining ordinary membership. Many of his pictures are in the National Gallery of Scotland, but a considerable number are housed in private collections. Among the former are ‘Bruce’s Castle of Turnberry’, ‘Ravenshagh Castle’, ‘Scene on the Clyde’, ‘The Trosachs’, ‘Aberlady Bay’, and ‘Trees on the Bank of a Stream.’ The National Gallery in London contains ‘Loch an Eilan’ and the South Kensington Museum has a water-color of ‘Duddingston Loch.’ He felt throughout his artistic life the want of early and systematic training, but he holds a distinct place in the history of development of British art, as the first painter to grasp and express the wildness and power of Scottish scenery. Consult Baird, ‘John Thomson’ (1895).

THOMSON, Joseph, Scottish explorer in Africa: b. Penpont, Dumfriesshire, 14 Feb. 1858; d. London, 3 Aug. 1895. He was educated at the University of Edinburgh and there distinguished himself so highly that he was appointed in 1878 geologist and naturalist to the exploring expedition sent out to East Central Africa by the Royal Geographical Society under the command of Alexander Keith Johnston. When Johnston died, 28 June 1879, Thomson assumed the leadership of the party and conducted it to Lake Tanganyika and near the head-waters of the Kongo. A mutiny of his followers deposed him from his command and he returned by way of Lake Leopold, reaching the coast 10 July 1880. In 1882 he set out on a great journey from the east coast of Africa to Victoria Nyanza. This was undertaken on behalf of the National Agricultural Company and during it he visited Kilimanjaro and ‘Mount Kenia’ and proceeded through the country of the Masai by way of Lakes Naivasha and Baringo to Victoria Nyanza. In 1885 he was awarded the founder’s medal of the Royal Geographical Society and in the same year travelled to Zanzibar for the National Arab Company in order to conclude treaties with the kings of Sokoto and Gando. In 1888 he explored the Atlas Mountains in Morocco and in 1890–91 traveled on behalf of the British South Africa Company in the territory of the Cape and the Africa Protectorate. His travels are described in his works ‘To the Central African Lake and Back: the narrative of the Royal Geographical Society’s East Central African Expedition, 1878–80’ (1881); ‘Through Mainland: a Journey of Exploration Among the Snowclad Volcanic Mountains and Strand Tribes of Eastern Equatorial Africa’ (1885); ‘Travels in the Atlas and Southern Morocco: a Narrative of Exploration’ (1889). He also wrote a work on ‘Mungo Park and the Niger’ (1890) and a novel ‘Ulu’, with Miss Harriet Smith. Consult ‘Life’ by J. B. Thomson (1896).

THOMSON, Sir Joseph John, English physicist: b. Manchester, 18 Dec. 1836. He was educated at Owens College of his native city. In 1859 he was presented to the parish of Duddingston, near Edinburgh, and here he rapidly acquired fame as a landscape-painter and developed a close friendship with Sir Walter Scott. His pictures were much in demand and he exhibited frequently in Edinburgh. On the foundation of the Scottish Academy in 1830 he was elected an honorary member, after declining ordinary membership. Many of his pictures are in the National Gallery of Scotland, but a considerable number are housed in private collections. Among the former are ‘Bruce’s Castle of Turnberry’, ‘Ravenshagh Castle’, ‘Scene on the Clyde’, ‘The Trosachs’, ‘Aberlady Bay’, and ‘Trees on the Bank of a Stream.’ The National Gallery in London contains ‘Loch an Eilan’ and the South Kensington Museum has a water-color of ‘Duddingston Loch.’ He felt throughout his artistic life the want of early and systematic training, but he holds a distinct place in the history of development of British art, as the first painter to grasp and express the wildness and power of Scottish scenery. Consult Baird, ‘John Thomson’ (1895).

THOMSON, Thomas, Scottish antiquary and elder brother of Rev. John Thomson, the painter: b. Dailly, Ayrshire, 10 Nov. 1785; d. Edinburgh, 2 Oct. 1852. He was graduated from Glasgow University in 1789 and adopted the law, and in 1807 he was admitted an advocate in 1793. He acquired a large practice, but gradually devoted him more and more to the study of legal antiquities. In 1832 he succeeded Sir Walter Scott, who was one of his close friends, as Bannatyne Club. Among his numerous publications are ‘The Acts of the Parliament of Scotland, 1424–1707’ (10 vols., 1814–24); ‘The Instrument Magni Sigilli Regum Scottorum, 1142–1814’ (1814); ‘The Acts of Causes and Complaints, 1466–94’ (1831); and ‘Acts of the Lords of Council in Causes, 1478–95’ (1839); ‘Forms of Process in the Court of Session during the Early Periods, with the latter variations’ (1833); ‘Chamberlain Rolls’ (3 vols., 1817 and 1818); and ‘Memoirs of Sir George Mackenzies’ (1854) by Cosmo Innes.

THOMSON, Thomas, British chemist: b. Crieff, 12 April 1773; d. near Holy Loch, 7 July 1852. He was educated at Crieff, Stirling, and the University of Saint Andrews, and in 1799 graduated M.D. at Edinburgh. He edited the supplement to the third edition of the ‘Encyclopedia Britannica,’ to which he contributed the articles ‘Chemistry,’ ‘Minerals,’ and ‘Chemical Philosophy.’ His treatise on ‘The Art of Dyeing’ (1818) and his ‘A Treatise on Dyes’ (1820) were useful contributions to the knowledge of dyes and dyeing.

THOMSON, Thomas, British chemist: b. Crieff, 12 April 1773; d. near Holy Loch, 7 July 1852. He was educated at Crieff, Stirlingshire, and the University of Saint Andrews, and in 1799 graduated M.D. at Edinburgh. He edited the supplement to the third edition of the ‘Encyclopedia Britannica,’ to which he contributed the articles ‘Chemistry,’ ‘Minerals,’ and ‘Chemical Philosophy.’ His treatise on ‘The Art of Dyeing’ (1818) and his ‘A Treatise on Dyes’ (1820) were useful contributions to the knowledge of dyes and dyeing.
and 'Vegetable, Animal and Dyeing Substances.' In the article 'Minerology' he used the system of symbolic representation, but it is incorrect to describe him as the introducer of this auxiliary of chemical science. In 1800 on the completion of the 'Encyclopædia,' he began a course of lectures on chemistry, which he continued till 1811, opening, in addition, a laboratory for students. The institution of this laboratory is the first institution of the kind in Great Britain. In 1802 he published the first edition of his 'System of Chemistry,' which obtained rapid success both in Great Britain and on the Continent. In 1810 he published his 'Elements of Chemistry.' His 'History of the Royal Society' appeared in 1812. In 1813 he went to London and began there a scientific journal, the *Annals of Philosophy*, which continued to edit till the end of 1820. The lecturership in chemistry in the University of Glasgow was conferred on him in 1817, the office being shortly afterward raised to a professorship, and he himself created regius professor of chemistry in 1818. His work on the atomic theory was published in two volumes in 1825, using a method of establishing the First Principles of Chemistry by Experiment. The accuracy of the work was severely criticized by the Swedish chemist Berzelius. Thomson discovered a large number of chemical compounds, such as hyposulphurous acid and a great variety of salts. In 1830–31 he published his 'History of Chemistry,' and in 1836 appeared his 'Outlines of Mineralogy and Geology.' In 1846 he retired from his professional duties.

**THOMSON, William.** English archbishop; b. Whitehaven, 11 Feb. 1819; d. York, 25 Dec. 1890. He was educated at Queen's College, Oxford, of which he was successively fellow, tutor and head. Ordained deacon in 1842, he was curate at Saint Nicholas, Guildford and Cuddesdon, near Oxford, 1842–47, when he was made tutor of his college, of which he became provost in 1855. In 1861 he edited a series of essays by various writers under the title 'Aids to Faith,' intended as a counterpart to 'Essays and Reviews'; and in that year was appointed bishop of Gloucester and Bristol. In February 1863 he became archbishop of York. He was the author of 'An Outline of the Necessary Laws of Thought' (1842); 'The Atoning Work of Christ, viewed in Relation to some Current Theories' (1853); 'Crime and its Excuses' (in Oxford Essays, 1855); 'Life in the Light of God's Word'; 'Limits of Philosophical Inquiry'; 'Design in Nature'; and a series of essays entitled 'Word, Work and Will.'

**THOMSON, William, 1st Lord Kelvin.** British mathematician and physicist; b. Belfast, 26 June 1824; d. Glasgow, Scotland, 17 Dec. 1907. He was graduated from Cambridge in 1845, and in 1846 published a paper 'On the Uniform Motion of Heat in Homogeneous Solid Bodies, and in Connection with the Mathematical Theory of Electricity,' contributed to the Cambridge Mathematical Journal. In 1845 he became first editor of the *Cambridge and Dublin Mathematical Journal*, a post which he held for seven years. He was appointed professor of natural philosophy in the University of Glasgow in 1846, and occupied this position for 53 years, till his resignation in 1899. His jubilee as a professor was celebrated in 1896 by many brilliant university functions and distinguished visitors. The conditions came from many countries to do him honor. Lord Kelvin's contributions to physical science and its applications are very numerous. In all the domains of dynamics, sound, light, heat, magnetism and electricity there are achievements to his credit. The form of water in which the mariner's compass is now generally employed was patented by him in 1876, and the siphon recorder used in connection with almost all submarine cables was introduced by him in 1867. His extremely delicate mirror galvanometer was also originally invented for the purposes of submarine telegraphy, and in this connection his automatic curb sender is also worthy of notice. His quadrant and absolute electrometers are well known to students of electrostatics, and his portable electrometer and water-dropping apparatus are of great use in practical meteorology. He published important papers on the theory of magnetism, and the theory of electric images with the associated method of establishing the First Principles of Electricity by Experiment. Lord Kelvin was the first to direct the attention of scientific men to Sadi Carnot's pioneer work in thermodynamics, and it is mainly to his researches and those of Rankine and Clausius that we owe the present advanced condition of that science. The absolute scale of temperature based on the second law of thermodynamics was first proposed by Lord Kelvin. In the building up of the great modern doctrine of the conservation of energy Lord Kelvin took an important part, and the portion of that doctrine known as the dissipation of energy is almost entirely due to him. He also propounded a modified atomic theory in which the atoms are conceived as vortices, and he threw much light on such questions as the age of the earth, cosmic evolutions and geological time. Lord Kelvin, then William Thomson, was associated as electrician with the company which undertook the laying of an Atlantic cable in 1857, and was largely responsible for the success which ultimately crowned the heroic effort of submarine telegraphy in 1866. He might, indeed, be called the first electrical engineer. He was knighted in 1866, and in 1892 was raised to the peerage as Baron Kelvin of Wetherall, Laros, Ayrshire. He was president of the Royal Society from 1890 to 1895, and was awarded the Copley and Royal medals. In 1871 he presided over the meetings of the British Association at Edinburgh. He was Rede lecturer at Cambridge in 1866 and was many times elected president of the Royal Society of Edinburgh. He was awarded the Prix Poncelet by the Institute of France in 1874, and the Helmholtz medal by Germany in 1892. He received so many honors that there is not space to enumerate them. Perhaps the most notable was the jubilee celebration of his professorship at Glasgow University in 1896. The gathering was attended by 2,500 distinguished guests; the ceremonies and jubilation lasted three days. The Grand Cross of the Royal Victorian Order was conferred on him. The city officials joined in the event, cable companies all over the world sent congratulations and a message was sent from the university

The text is about the life and work of Sir William Thomson, known also as Lord Kelvin, a British mathematician and physicist. He made significant contributions to fields such as thermodynamics, electricity, and the theory of magnetism. He was a key figure in the development of submarine telegraphy and was involved in important research on the age of the earth and cosmic evolutions. Thomson was also a leading exponent of the modern doctrine of the conservation of energy and contributed to the establishment of the Kelvin temperature scale. His work and contributions were widely recognized, earning him numerous honors and awards throughout his career. The text includes a brief biography of Thomson, highlighting his early education, professional career, and significant contributions to science. The text also mentions his role in the laying of the Atlantic cable and his involvement in the British Association for the Advancement of Science.
half around the world, via Newfoundland, New York, San Francisco, New Orleans, Washington and back to London and Glasgow, being received by Lord Kelvin in seven and one-half minutes. Lord Kelvin's most important published work is the well-known "Treatise on Natural Philosophy" (Part I, 1867; new ed., 1879), written with Professor Tait. An abridged edition has also been published. His other works are "Papers on Electrostatics and Magnetism" (1873); "Mathematical and Physical Papers" (1882, 1884, 1890); "Popular Lectures and Addresses," and articles in the 9th edition of the "Encyclopaedia Britannica," some of which have been also published separately. He visited the United States in 1884, in 1892 and again in 1902. Consult his "Life" by Andrew Gray (1908), and by Thompson, S. P., (1910).

THOMSONITE, one of the zeolite family of minerals \((\text{H}_3\text{Si}_3\text{Al}_4\text{Si}_2\text{O}_{12})\). It usually occurs in columnar forms or radiated concretions of snow-white color, less frequently in compact orthorhombic crystals (comptonite). It is a hydrous silicate of aluminum, sodium and calcium. It is found filling cavities in igneous rocks in Scotland, the Faroe Islands, Nova Scotia, and Golden in Colorado, and elsewhere. Much so-called thomsonite, including the pebbles of Grand Marais, Minnesota, is mesolite.

THOR, thôr or tór, in Norse mythology, the god of thunder, son of Odin by Jörd (the earth). He was represented as a powerful man in the prime of life, with a red beard, girt with his girdle of strength, and armed with his mighty hammer Míöleir ("the smasher"). He was the foe of the giant demons, and friendly to man. Some have thought him identical with Jupiter; others identify him with the Anglo-Saxon, Thonar. Sacrifices were offered to him under oaks. Thursday has its name from him. Consult Ueland, "Der Mythus vom Thor" (1868).

THORACIC DUCT, a vertical canal lying in front of the spine, and receiving the terminations of the lacetal and lymphatic vessels. It is the receptacle for the materials which go to renovate the blood, these materials being derived from the digestion of food and from the elaborated products of the lymphatic glands. From the thoracic duct the chyle or nutrient matter is poured directly into the current of the circulation, the duct opening into the great veins (internal jugular and subclavian veins) lying at the root of the neck on the left side. A second and smaller lymphatic or thoracic duct lies on the right side of the body, and receives the contents of the lymphatics of the right arm and right side of the head. The chyle duct is dilated at its lower extremity, at the junction of the loins and back, into the receptaculum chyli. The contents of the thoracic duct contain the elements of the blood already elaborated.

THORAH, tôrâ, or TORAH, in Hebrew literature, a definite commandment laid down by recognized authority. When used with the definite article the word refers specifically to the Mosaic law, that is, the Pentateuch; and often to the Ten Commandments.

THORAX, that part of the trunk in higher vertebrates between the neck and abdomen containing the heart, lungs and other viscera, enclosed by the ribs, sternum and thoracic vertebrae. The most important bony structure that forms the chest. The term is also applied to those segments of the body in Arthropoda which lie between the head and the abdomen. Thus in insects there are three segments forming the thorax, namely, the prothorax, mesothorax and metathorax. The prothorax bears the first pair of legs, the mesothorax the second pair of legs and first pair of wings, while the metathorax bears the third pair of legs and second pair of wings. In crustaceans and spiders the head and chest segments are united together to form a single mass, named the cephalothorax. In man and higher vertebrates the thorax is formed by the sternum or breast-bone in part and by the ribs and spine, laterally and behind. In mammals alone is the thorax and its cavity completely shut off from the cavity of the abdomen by a complete diaphragm or midriff. See ANATOMY; ZOOLOGY; HUMAN; TORSO.

THOREAU, thôrô, Henry David, American "poet-naturalist": b. Concord, Mass., 12 July 1817; d. there, 6 May 1862. He was graduated at Harvard in 1837, and began in that year the copious journal with which in 1859-60 he filled 30 manuscript volumes, did some teaching at Concord and on Staten Island, N. Y., appeared occasionally as a lyceum lecturer in Concord and other New England towns that chose to call him, and, until his death, practised at intervals and with great skill his art of pencil-manufacture, making, Emerson said, as good an article as the best English. In 1839 he took the excursion recorded in "A Week on the Concord and Merrimack Rivers," which was published in 1849 in an edition of 1,000; the return of 700 as unsalable (1853) afforded him the humorous boast that he had now a fair-sized library all of his own writing. In the course of the voyage there are many observation and opinion, the result being less a narrative than a collection of essays and discussions. Chiefly for the preparation of this work, but also to undertake an experiment in simplicity of living, and to have opportunity for observation of wild nature, he lived alone in a house built by himself, from July 1845 to September, 1847, at Walden Pond, not far from Concord village. There, too, he wrote several of his papers and gathered material for his "Walden, or Life in the Woods" (1854), the best known and probably the most nearly classic of his books. After this episode, which some folk professed to think very odd, "he preferred," says Emerson, "short work," a building, hunting, grafting, surveying and other odd jobs, writing meanwhile for current periodicals. In 1848, 1853 and 1857 he went to the Maine woods, and his accounts, partially printed in magazines in his lifetime; were posthumously collected in book form, constituting what is perhaps after "Walden," his most interesting work. Other jaunts to Cape Cod (1849) and Canada (1850) were also described. The titles of these two "principal" volumes were also those of his "Walden, or Life in the Woods" (1854), "The Mountains of the Moon" (1864), "The Backwards" (1865); "Early Spring in Massachusetts" (1881); "Summer" (1884); "Winter" (1886);
THORIANITE—THORNE

Thorite, a mineral consisting of thorium and uranium oxides, about cent of the former and 12 per cent of the occurs at Norris, Madison County, Mont.

IORITE, a rare but important mineral almost exclusively in Norway. Theoretically, it is an anhydrous thorium silicate, but all analyses give the presence of erable water and more or less uranium, with no iron. The variety orange, which is of hot orange to lemon-yellow color, is the known thorium ore, containing by analysis 55% thorium. Thoronite is a reddish-brown color and contains 9 to 10% of uranium sesquisulfide. Thorite proper is very dark brown. It crystallizes in prismatic crystals isomorphic with zinc, the usual habit being a square prism terminated by a square pyramid. Prismatic cleavage is distinct and the fracture is conchoidal. Its hardness is 5.5 to 5, and the specific gravity ranges from 4.2 in some uranothorite to 5.4 in some orange. It is transparent in thin splinters to nearly opaque in large or altered masses. Its lustre is resinous, streak yellow to dark brown. Thorite was formerly one of the chief sources of supply of the rare earth thorium and is still of much value for that purpose, though its use has been supplanted.

THORIUM, one of the most valuable of the rare elements. It was discovered by Berzelius in a Swedish mineral and called by him thorium after the ancient Swedish god Thor. Found in the minerals thorite, orange, euxenite, aureite and in monazite sand. This latter substance is found in considerable quantity in Brazil and in North Carolina and is one of the most valuable sources of thorium and of a number of other rare elements related to it. Thorium, symbol Th, atomic weight 232, is a grayish metallic element that can be separated in an elementary condition by heating the chloride, ThCl₄, with metallic sodium. It is soluble in mineral acids and burns brilliantly to the oxide ThO₂, thorium, when heated in the air. This oxide is the most important compound of thorium as it is used together with the oxides of other rare elements to form the "mantles" for the Welsbach incandescent gas lights. See MINERAL PRODUCTION OF THE UNITED STATES.

THORN, förn, Germany, in Prussia, in the province of West Prussia, on the Vistula, 51 miles southwest of Marienbad. It is an important stronghold, the head of the eighth Prussian fortress district, a railway junction, surrounded by detached forts, and has withstood many sieges, the last being in 1915. It dates from 1231, and its principal buildings comprise the ancient castle, town-house and other gabled and handsome edifices; there is also a statue to Copernicus, who was born there. It was taken from Poland by Prussia in 1793. Its manufactures include machinery, castings, soap and a special gingerbread. There is a thriving trade in corn and timber, besides wood, linen, hides, bark and ashes. An important conference was held in 1645 to reconcile Protestant and Catholic differences, presided over by German and Polish churchmen, but was far from meeting with success. Pop. 46,227.

THORN-APPLE. See DATURA.

THORNDIKE, Edward Lee, American psychologist: b. Williamsburg, Mass., 31 Aug. 1874. He was educated at Wesleyan University (A.B., 1895), Harvard (A.B., 1896), Columbia (Ph.D., 1898), and taught in the Western Reserve University (1896-99). He became instructor in psychology in Columbia University (1899-1904) and has been professor there since the latter year. He is author of Educational Psychology (1903); Mental and Social Measurements (1904); Animal Intelligences (1911); The Original Nature of Man (1913); The Psychology of Learning (1914), and many monographs on similar subjects.

THORNE, Joseph, American inventor: b. Marlborough, N. Y., 17 Feb. 1826; d. Sing Sing, N. Y., 4 May 1897. He served through the
THORNHEADED WORMS — THORNWELL

Mexican War. Becoming an engineer he associated himself with Elias Howe while the latter was perfecting his sewing-machine. Afterward he was connected with the Singer Company and later established a factory in Scotland. He invented a typewriter, a sewing machine and a typesetting and distributing machine, which bear his name. This last machine was developed in Harvard, Conn. See COndef BORINES MACHINES.

THORNHEADED WORMS, ACANTHOCEPHALA, a group of parasitic round-worms (q.v.) of the genus Echinorhynchus, having the proboscis armed with a circle of hooks.

THORNHILL, Sir James, English painter: b. Melcombe Regis, 1676; d. Thornhill, Dorset, 13 May 1734. Queen Anne appointed him her sergeant-painter and he was much engaged in the decoration of palaces and public buildings, in which his chief works are to be found. Among his best efforts may he mentioned the dome of Saint Paul's, Great Hall at Greenwich Hospital and some rooms at Hampton Court. He also painted the altar-pieces at All Souls and Queen's colleges, Oxford. His forte was in the treatment of allegorical subjects. He was in his position as painter to King George I in 1720 and knighted in the same year. Hogarth clandestinely married Thornhill's daughter in 1729, and always expressed great admiration for that painter's work, which shows in no small degree his genius, although living critics have not confirmed the favorable verdict of George I and his contemporaries.

THORNS AND SPINES IN PLANTS, acute-pointed projections from the trunks, branches or twigs of plants. A thorn arises from the wood of which it is an outgrowth, whereas a prickle or spine is a growth from the bark and can be removed when the bark is peeled off. The raspberry and the rose are good examples of prickly-covered plants; the hawthorn and some wild plums of plants covered with thorns. Prickly and spines are believed to be useful to the plants which bear them, either as protections against the browsing of animals, as auxiliaries in climbing, holding their position, etc.; thorns are considered to be abortive branches, a deduction based upon the facts that in nature they often bear leaves, and under domestication may develop into branches. Various hawthorns exhibit the former phenomenon and the apple and pear the latter.

THORNTON, Sir Edward, English diplomat: b. London, 13 July 1817; d. there, 26 Jan. 1900. He was educated at King's College, London, and at Cambridge University and in 1842 was appointed attaché at Turin. He was engaged in important diplomatic missions to Mexico and the South American states in 1845-65, and in 1845-67 was Minister to Brazil. In 1847 he was appointed Minister to the United States, served on the commission to adjust the Alabama Claims in 1857 and was arbitrator in the commission on the United States and Mexican claims in 1873. He became Ambasador in Russia in 1861, to Turkey in 1884 and in 1887 retired from the diplomatic service.

THORNTON, John Wingate, American author: b. Saco, Me., 12 Aug. 1818; d. Scarboro, Me., 6 June 1878. He took his LL.B. degree at Harvard in 1840; was admitted to the bar and practised in Boston. The honorary A.M. degree was conferred on him by Bowdoin College in 1860. He was the founder of the New England Genealogical Society and was vice-president of the American Static Association. His published works chiefly include genealogical memoirs of distinguished men and families, including "Life of John Bowles," "Ancient Pemaquid," "Pulpits of the American Revolution" (1860) and the "Historical Relations of New England to the English Commonwealth" (1874). Consult "Memoirs of John Wingate Thornton" (Boston 1879).

THORNTON, Matthew, American legislator, signer of the Declaration of Independence: b. Ireland, 1714; d. Newburyport, Mass., 24 June 1803. He came with his parents to America in 1717, lived for a time at Wiscasset, Me., removed to Worcester, Mass., and there received his education. Entering the profession of medicine, he practised at Londonderry, N. H., and in the Louisburg expedition under Sir William Pepperell (1745) served as surgeon. He presided over the provincial convention which drafted the Declaration of Independence in the Continental Congress: and although he did not take his seat until November, and had not been elected when the Declaration of Independence was adopted, he was granted the special privilege of signing it. He had already been chief justice of the Court of Common Pleas in New Hampshire when in 1776 he was made a judge of the Supreme Court, and this office he held until 1782.

THORNTON, William, American architect and physician: b. Tortola, West Indies, 1722; d. Washington, D. C., 1827. He was educated as a physician and resided for a number of years in Philadelphia where he was well known for his scientific attainments and was a member of the American Philosophical Society. He was a skilled architect and designed the Philadelphia Library building, the building removed to Washington and planned the Capitol, of which he partly supervised the construction. He was the first commissioner of public buildings of the national capital and also was first Commissioner of the patent office, to which he was named in 1802. He wrote "Cadmus or the Elements of Written Language" (Philadelphia 1813).

THORNWELL, James Henley, American educator: b. Marlborough District, S. C., 9 Dec. 1812; d. Charlotte, S. C., 1 Aug. 1882. He was graduated in 1831 from the South Carolina College and studied law but declined to practise and finally was ordained by the Bethel Presbytery in 1834 and became pastor of the Lancaster Court House congregation. He was professor of logic, belles lettres and metaphysics in the South Carolina College (1837-1840), Columbus, S. C. (1840), returning to the college as professor of literature (1842-52). In 1841 he visited Europe. He served as president of the South Carolina College (1852-55). He was author of a number of tracts of theological subjects and his writings, edited by Rev. J. B. Adger were published in 1854, Consult Palmer, Ben, "Life and Letters" (Richmond 1875).
father. In his 11th year he entered the Academy of Arts, where he gained in 1793, along with other lovers of art, permission to travel abroad. He resolved to visit Rome, where he arrived in November 1797, and under the inspiration of Canova and Carstens the painter devoted himself to reproducing that idealism, the idealism of the ancients, which became even after the one object of his artistic life. It was not until 1803 that he became at all widely known. He had finished a model of Jason without finding a purchaser, when the well-known and wealthy Thomas Hope called at his studio and arranged with him to have it executed in marble. The fortune of its designer was now made. Commissions flowed rapidly in upon him, new creations from his hand followed in quick succession and his abilities as a sculptor became everywhere recognized. In 1819 he returned to Denmark, and his journey through Germany and his reception at Copenhagen bore the appearance of a triumph. His first works in this city were the busts of the king and queen. He was next employed by the community in the rebuilding of the Fruzirkirke or church of Our Lady, to design the decorations for the same, which now form its main ornament. In 1820 he returned to Rome, visiting on his way Berlin, Dresden, Warsaw and Vienna, and receiving numerous orders for works. He remained at Rome till 1838, when he undertook another journey to Copenhagen, being principally moved to this step by the contemplated establishment in that city of a museum of his works and art treasures. His return was a true national festival, both for Copenhagen and the whole of Denmark. With the exception of a short visit to Rome the remainder of his life was spent in the Danish capital, and he both took a vivid interest in the establishment of the Thorwaldsen Museum (q.v.) and enriched it by important contributions. Consult Thiele, ‘Thorwaldsen’s Biographie’ (1836); Pion, ‘Thorwaldsen sa Vie et ses Oeuvres’ (1867); both of these works have been translated into English; Hammerich, ‘Thorwaldsen und seine Kunst’ (1876).

THORVALDSSEN MUSEUM, a building and art collection at Copenhagen raised from funds left by the sculptor Thorwaldsen. The building was constructed after a plan furnished by the architect Bindesbøll, and is purely Greek in style. It contains the models and works bequeathed by the sculptor to his native city, which comprise 80 statues from his hand; three long alto-relievs and 130 busts. In the centre of the building is the highly decorated tomb of Thorwaldsen. The museum was opened in 1840.

THOTH, thoth or thô, an Egyptian deity identified by the Greeks with Hermes. He was originally the moon-god, and the invention of letters, arts and sciences was attributed to him. The ibis was sacred to him and he is represented with the head of that bird, and with the tail of the cobra. The dog-headed ape is also one of his attributes, and he is frequently depicted with a dog’s head. There were 42 sacred books bearing his name, which were under the guardianship of the Egyptian priests. These books he is said to have composed; and he accordingly appears in the monuments with tables and stylus. He has been identified with the Greek Mercury and Hesperus and the Roman Mercury and Iusoret.

THO THMES, thôth’éz or thô’t’éz (so of Thoth); the name of four Egyptian kings. Under Thothmes I, Egypt saw its darkest days come to end with the expulsion of the Hyksos and the revival of truly national art and civilization and of national power. The era of foreign invasion, with the emigration of the royal treasury, began. Ethiopia was made a tributary state, and eastward the limit of Egyptian power was pushed as far as the Euphrates. At his death Thothmes I was succeeded by Thothmes II, his eldest son, with Hatasu, his daughter, and Thothmes III, his younger son, as coregents. Thothmes II beautified Thebes, but his reign was brief and insignificant. Thothmes III was the Alexander of Egyptian history. After the death of Hatasu he entered upon that series of wars which comprised 14 campaigns, in the course of which he subdued Palestine, Syria, Mesopotamia in part, and large tracts of territory between the Euphrates and the Mediterranean. The names of the cities he took, including Kadesh and Tyre, are inscribed in large, transparent stelae on the walls of Karnak. He added extensively to the architectural glories of Thebes. As Hatasu, the Semiramis of Egypt, erased the name of the Thothmes II, her half-brother, from his monument at Karnak, so was his name erased with the record of her campaigns, during which she appeared in male attire, from the recording inscriptions by Thothmes III. He reigned from 1503 to 1440 B.C. He was succeeded by Amenhotep II at whose death Thothmes IV began his reign. The latter waged war in Ethiopia, Syria and Phoenicia, but his career was without national or political significance. Consult Breasted, J. H., ‘History of the Ancient Egyptians’ (New York 1906).

THOU, too, Jacques Auguste de (in Latin, THUMANUS), French magistrate and historian. b. Paris, 8 Oct. 1553; d. 7 May 1617. On the revolt of Paris, produced by the violence of the League, he adhered to Henry III, and after the assassination of the Duke of Guise, was principally instrumental in reconciling Henry with the king of Navarre. In 1595 he succeeded his uncle as chief justice, and immediately registered in anticipation of the Edict of Nantes, which he assisted in preparing, the Edict of Saint Germans in favor of the Protestants. In the regency of Mary de Medici he was appointed one of the directors-general of finance, and otherwise employed in nice and difficult matters, in which he was conspicuous for integrity and ability. His greatest literary labor was the composition in Latin of a luminous ‘Historia sui Temporis,’ of which the first part appeared in 1604. When finished it consisted of 1,38 books, comprising events from 1545 to 1607. It is remarkable for general impartiality. To this he added ‘Commentaries,’ or memoirs of his time, composed in the same spirit. The most complete edition of the history is that published in London in 1733, by Buckley, in seven volumes. Consult Collinson, ‘Life of Thuanus, with an Account of his Writings’ (1807).
THOUGHT — THRACE

THOUGHT, a cognitive relation other than direct awareness, born by the either toward an object which is believed to, toward objects capable of existence, as a universal, concerning which the on of existence has no meaning. This feature distinguishes thought from ination in the narrower sense which is ed toward objects capable of existence, ut involving any belief in their existence. it differs from mere presentation, the rt-relation, so far as it furnishes us with knowledge of its objects, furnishes us what Bertrand Russell calls knowledge by onon — knowledge that is, which may be ed by propositions. On this account ut can be conveyed by language, for lan- though totally unable to transmit an inate presentation, is well adapted as a e for the relations between propositions, bodied in propositions. This intimate as- to between thought and language leads e nominalist identification of the two, possesses all the defects inherent in form of nominalism (q.v.). A more s form of this nominalism pervades a part of the modern psychology of real and consists in the recognition in the f life of nothing but particulars. The mental method of psychology is, of, introspection. Now, the psychologist e his training in introspection in the n of the senses. Here introspection s for the most part the formation of an ory of the sense-data constituting a given nce. The psychologist consequently e the tendency to consider the analysis consciousness complete when all the mental of the level of sense-data are checked. id tagged. When he approaches an act ought, or the consciousness of a universal, y similar experience, he is likely to find mental states as he is accustomed to x, entirely absent, except for a few vague al organic or kinesthetic sensations and images. He, therefore, identifies these the thought-consciousness or universal- ousness and either concludes that these of consciousness add to the mind constituents not already found isation, memory, imagination and feeling, ulates the existence of some substantive al state not involving images or emotions. e to explain how such a barren mental can be so pregnant with meaning, he has e to such unexplanatory phrases as "con- attitudes." The true reason for the f of a vague picture of a particular tri to convey the entire meaning of triangu- or for power of a verbal image of the f gravitation to symbolize the law itself, t the mind is a structure and no struc- s exhausted by its inventory. ere is no doubt on earth that whether the stency or the correspondence theory of be valid, a necessary condition of true ng is that the pattern of thought should work. The general agreement of two ns agree, we do not have the relations e parts of one pattern symbolized by the of the other, but precisely by the rela- between those parts. Accordingly, it is reasonable to suppose that relations are conveyed in the mind, not by items, but by relations; that qualities are conveyed by qualities; that facts are conveyed by facts. The muscular strain in the orbits that may be the only substantive state in my mind when I think of a certain mathematical theorem is not my consciousness of that theorem, but merely a sort of a mental chalk-mark with which I make myself aware of my reference to the theorem. To call my true consciousness of the theorem either imageful or imageless involves a gross confusion of categories. (See Logic; Meaning; Psychology). Consult James, W. Principles of Psychology (New York 1890); Messer, A., Empfindung und Denken (Leipzig 1908); Psychologie (Stuttgart 1904); Ogden, R. M., Introduction to General Psychology (New York 1910); Titchener, E. B., Experimental Psychology of the Thought-Proceses (New York 1909).

THOUGHT TRANSFERENCE. See Telepathy.

THOUSAND ISLANDS, a group of islands in the Saint Lawrence River (q.v.), near Lake Ontario. For about 40 miles east of Ontario the Saint Lawrence has a width of three to seven miles and here there are seven large and 1,600 small islands. The belt of Laurentian gneiss which extends from the Adirondacks in New York into Canada is here crossed by the Saint Lawrence River. The crystalline rock and glacial deposit forming the river bed presents an uneven surface; some of the points being above the water form islands. A large number of the islands belong to Canada, the others to the State of New York. Hand-some summer residences have been erected on many of the islands and large hotels furnish accommodations for the many city people who visit the place each summer.

THRACE, thrâs, anciently a part of the Balkan Peninsula, whose territory was somewhat indefinite, but which comprised the region north of Macedonia, including Scythia. Its territory was understood differently at different times by the ancients, but was later limited to the country between the northern boundary of Macedonia and the Danube and that which lies between the Black Sea, the Bosporus, the Propontis and the Hellespont, the Aegean Sea and the Strymon River. The Balkans divided it into two parts — the Romans recognized only the southern division as Thrace. The land was inhabited by wild tribes, abounded in mines, had fertile lands and produced celebrated horses. The chief mountains were the Haemus (Balkan), Rhodope and Pangaenos. The largest river, the Hebrus or Maritza. The chief towns, Abdara where Democritus was born; Sestos and Byzantium. The mythological founders of Greek poetry, music and philosophy are supposed to have come from Thrace. The Thracians were classed as barbarians up to about 475 B.C., when Xerxes invaded the country and introduced the art and introduced the art of the Greeks. Some authorities believe that the Thracians agreed to have Philip of Macedon in the 4th century occupied a portion of the territory, and in 133 B.C. it came under the power of Rome. Native kings maintained a nominal rule, however, for several centuries. About 335 a.d.
Constantine sent a colony of Sarmatians to Thrace and continued to colonize the country. A few years later Thrace was overrun by the Goths and later by Attila and his Huns. In the following centuries a Bulgarian population developed, and about 1450 the country came under Turkish rule. For modern history see BULGARIA; BALKAN PENINSULA; SERBIA.

The Thracians can hardly be regarded as a distinct race, being a mixed people much confused with the Illyrians. The early tribes were low in morals and addicted to phallic worship. Their dialects were closely allied to the Greek. The native deities were Ares, Bendis and Dionysius. See ILLYRIA.

THRASHER, one of the large, thrush-like wrens of the American genus Hydrochus, of which the familiar Eastern species is the brown thrasher (H. rubecula), one of the most pleasing of American migratory birds. It is about 10 to 12 inches in length, slender, with a long bill and tail, rufous upper parts and a cream-white breast sharply marked with darker streaks. A frequent visitor to orchard and shade-trees, it is as likely to make its nest on the ground or upon bush-piles near the house as at the edge of the woods, and its oblong pepper-and-salt sprinkled eggs are familiar to every country boy. The thrasher in spring utters a highly varied song, so brilliant and full of startling phrases of melody and apparent mimicry that it fairly rivals the performance of the mocking-bird itself. While it eats some grain, it is tolerated because it is destructive to various grasshoppers, worms and bugs. The genus contains several other well-marked and interesting species of the West and Southwest. Consult Coues, 'Birds of the Southwest' (Washington 1879); Forshush, E. H., 'Useful Birds' (Boston 1913) and ornithologies of the United States generally.

THRASYBULUS, thra-sta-bu-lu's, Athenian general and democratic leader; d. about 390 B.C. He was a friend of Alcibiades, whose recall from exile he obtained. In 411 B.C. he commanded a galley in the fleet at Samos, joined in the opposition to the oligarchy of the Four Hundred, and exiled and excommunicated the Athenians in the fleet to uphold democratic government. At the battle of Cynossema he commanded the right wing and secured the victory by a sudden attack upon the Peloponnesians. In 407 B.C., with a fleet of 30 ships, he reduced most of the revolted cities on the coast of Thrace to submission and about one of the new generals. Banished on the establishment of the Thirty Tyrants, he seized, with the aid of some Thracians, the fortress of Phylae and with increased force occupied the Piraeus. After the accession of the Ten he was defeated by Lyons and Lybia, but, together with all who had joined him, was saved from punishment by the contrivance of Pausanias. In 395 B.C. he led an army to the assistance of the Thracians, then menaced by Sparta, and five years later was sent with 40 ships to aid the Rhodians against Tarentum, restored the Athenian焙lote (134 L.). By negotiating new alliances and reduced Methymna and other towns in Lesbos. Afterward sailing south, he anchored at the Pirymenon, near Aspendus in Pamphylia, when the inhabitants, exasperated by some act of his soldiers, fell upon him in the night and killed him.

THREAD. The filaments of fibrous substances spun out for weaving are in a general sense called threads, the specific name of such filaments being yarn. Thread as a specimen consists of two or more filaments of yarn twisted together for greater strength; when the filaments do not exceed two this is called doubling and the manufacturing process is doubling and twisting. Doubled yarn or thread is used in some sorts of weaving, especially in that called bobbin net, but its principal use is for sewing. When manufactured for the purpose it is specifically known as sewing thread. A large proportion of sewing thread is simply doubled yarn and the processes of yarn doubling and of the manufacture of sewing thread are substantially the same, but for sewing purposes often requires to be stronger and firmer in texture than doubled yarn and then three, four and six strands of yarn of fineness proportioned to the thickness of the thread required are used to produce it. The manufacture of sewing thread in the United States is very extensive. The chief seat of the cotton thread manufacture in Scotland is Paisley; in England, Manchester. Linen thread is manufactured largely in Ireland. Cotton was first used in the manufacture of sewing thread at Pawtucket, R. I., by Samuel Salter in 1794. Flax has been made everywhere, but as Mrs. Salter was spinning cotton she noticed the fineness of the fibre and at once conceived that it would make smooth thread. The idea was put into practice. The operation of spinning cotton is really making thread for weaving. A loose cotton called a "roving" is drawn out into a filament or yarn and twisted and wound on bobbins that later go to the weaving machine. See COTTON MANUFACTURES IN THE UNITED STATES.

THREADCELLS. See NEMATOCYSTS.

THREADNEEDLE STREET, London, England, the short thoroughfare faced by the Bank of England, which is proverbially called "The Old Lady of Threadneedle Street." The name is supposed to be derived from the three needles on the coat-of-arms of the Needlemakers' Guild.

THREADWORM, a common name often used for any of the Nematoidea (q.v.). It is distinctly inappropriate when applied to the thick fleshly species like Aercris and belongs properly to filiform nematodes, especially the filariae. In medical usage the term ordinarily designates the pinworm (Oxyurus) or the whipworm (Trichuris), common intestinal parasites of man. See ROUNDWORMS.

THREAT is defined in law as a menace of destruction or injury to the lives or property of those against whom it is made and may be the subject of a civil action for damages or frequently an equitable action may be maintained to restrain threats and intimidations. One who is induced by threats to enter into an agreement, pay money, surrender, and perform other act, when in itself is lawful, may by proper means avoid the consequences of such act, same having been performed under duress. One who threatens
another a bodily harm or to take the life
other may be required to give bond to
be peace; to threaten a court, or any-
der its immediate protection, is punish-
nd in some jurisdictions to obtain a pe-
advantage by threat is a punishable
as is also a threat to accuse one of a
for the purpose of obtaining money. In
of the United States the offense of
threatening letters for the purpose of
ng money is punishable and it is con-
the possession of the United States
l upon the outside of any mailable mat-
y printed or written threatening lan-
and one is punishable who assists know-
forward threatening letters. See
MAIL; CORRUPT PRACTICES ACTS.

REE-COLOR PROCESS. See Color-
NG; PRINTING; ENGRAVINGS.

REE FATES, The. See Norns.

REE HOURS' AGONY, or THREE
S' SERVICE, a devotion practised on
Friday, from noon till 3 o'clock in the
Catholic and some Protestant Episcopal
in commemoration of the Passion. It
roduced by Father Mestia, S.J., of Lima,
730, and reached the United States
cced into the English Church about 1865
as rendered legal by the Act of Uni-
; Amendment Act (1872), which per-
ditional services, consisting of any pray-
the Liturgy or Bible, with address or
and hymns.

REE KINGS, the men who came from
st to adore the Infant Jesus (Matt. ii,
They are probably called kings from
xii), 10, which verse is used in the serv-
Epiphany. They brought offerings of
'land, frankincense, and myrrh, and accord-
tion their names were Gaspar, Melchior
thasas. On their return to the East
vived baptism. The Empress Helena
to have brought their homes to Con-
oble, where they were removed to Mi-
d afterward to Cologne. In the chapel
Three Kings, built by the Emperor
ian (1459-1519), in Cologne Cathedral,
bibited their crowns and the shrine is
2d to retain their relics.

REE-MILE LIMIT. See Interna-
LAW.

REE MUSKETEERS, The. If a vote
ken in Europe and America as to the
storical romance ever penned there can
 doubt that it would favor 'The Three
ers' ('Les trois Mousquetaires'), of dre Dumas. Published in 1844, just
ecades after 'Waverley,' this work ex-
ed Scott's theory of the historical nov-
ection. It focussed interest upon cer-
figures whose fate was linked with
facts, personalities, and great move-
of a bygone day. Unlike the fictions
ott, however, it freely ordered and
 the facts of history, implying the
er's emancipation from reality and
'to shape his story at will so long as
ld reflect in general the spirit of the
represented. Dumas had read the
res M. d'Artagnan, by Gatien
de Sandras (Cologne, 1701-02). His
ition thus incited, played over the pe-
period of Richelieu's ascendency, and with un-
flagging verve and brilliance he described what
might have happened to a more courageous
and chivalrous d'Artagnan caught in the
counter-currents of amorous and political
trigue in 1628.

The plot turns upon the enmity between
the queen of Louis XIII and his Minister,
Richelieu. The latter seeks to control the
queen through his knowledge of her love for Buck-
ingham, attested by her bestowal upon the
ng lord of certain diamonds, the gift of her
husband. Richelieu, for his own ends, arouses
the jealousy of the king, who demands that the
queen wear the diamonds at a state ball. It
behooves the queen, therefore, to recover the
gems in all haste, and the difficult mission is
undertaken by d'Artagnan and his gallant
friends, the three guardsmen. After encoun-
tering well-nigh insuperable obstacles d'Artag-
nan succeeds, but he incurs the enmity of
Richelieu's most dangerous agent, Milady Cha-
ri. He falls enamored of her, yet escapes her
toils—assassination and poison—only to
learn that she is the cardinal's emissary sent
to England to threaten Buckingham with ex-
posure unless he will cease his efforts to aid
the besieged Huguenots in La Rochelle.
D'Artagnan and the musketeers, thereupon,
thwart Milady, who, languishing in prison, ere
long prevails upon her Puritan jailer to re-
lease her and to achieve the murder of Buck-
ingham. Then she contrives to poison d'Artag-
nan's sweetheart, but, pursued by the avenging
guardsmen, is overtaken and adjudged to suf-
fer death for her many crimes. Richelieu,
secretly pleased to be relieved of so wicked
an ally, pardons d'Artagnan and commissions
him a lieutenant of the musketeers.

From first to last, the romance moves at
a rapid pace in a world of passion and daring,
of hot blood and ready swords, of intrigue
and revenge, of jaunty heroism, of splendid
loyalty and of dauntless love and friendship.
It kicks up its heels, too, now and then, in
the mood of rollicking humor. For all its de-
partures from historic fact, it paints in vivid
colors a living picture of France in the 17th
century. Especially memorable are the
heroes. Though Milady prove the villain of melodrama
in petticoats, she is far from being a mere lay
figure; and Buckingham, Richelieu, the queen,
even the lackeys of d'Artagnan and the
musketeers, above all these gallant gentlemen
themselves, are vital creations. D'Artagnan,
the impetuous and generous Gascon, is well
matched by his friends, the shrill and dainty
Arams, the boastful and dandified Porthos,
and the melancholy Athos. It is small wonder
that the four should have enthralled the minds
of readers of every race and clime, and that
Dumas, yielding to popular demand, should have
continued their adventures in 'Twenty Years
After' (1845) and 'The Vicomte de Rete-
one' (1848-50). These sequels and 'The
Three Musketeers' are discussed in monographs
on Dumas, in French, by Glinel (1884), de
Bury (1885), Parigor (1902) and Lecomte
(1904), and in English, in Field (1873),
Spurr (1902) and Davidson (1902). The re-
ation of Dumas to Scott is made clear in
Louis Maugiron's 'Romantique historique en
France' (1898).

FRANK W. CHANDLER.
THREE-PHASE SYSTEM. See Electrical Terms.

THREE RIVERS, Canada, city, port of entry and county-seat of Saint Maurice County, Quebec, on the north bank of the Saint Lawrence River at its junction with the Saint Maurice, 90 miles below Montreal, 66 miles above Quebec and on the Canadian Pacific, and connected by ferry with the Grand Trunk Railway. By the French generally named Trois Rivieres. It has a large export trade in lumber and wood-pulp, the Shawanegan and other falls of the Saint Maurice being extensively utilized as water power for these industries; a large iron works, and important manufactures of foundry products and machinery, and other manufactures. The Roman Catholic cathedral is an imposing structure; other handsome buildings are the bishop's palace, the college and several convents, schools, and churches. The city is lighted by gas and electric lights and has hotels, banks and semi-weekly and weekly newspapers. Three Rivers was founded by Champlain in 1634, and a battle was fought here, 8 June 1776, between the Americans and British. The former were outnumbered and defeated. Pop. 13,691.

THREE RIVERS, Mich., manufacturing town in Saint Joseph County, on the Michigan Central Railroad, and at the junction of the Saint Joseph, Portage and Rocky rivers. It has car-building shops, railroad-supply factories, manufactures marine engines, knit goods, tools and paper pulp, and has foundries and brass and iron works. There is a handsome Carnegie library. Pop. about 5,000.

THREE-WIRE SYSTEM. See Electrical Terms.

THREMMATOLOGY. A term proposed by Ray Lancaster (from the Greek thremma, a nursing), to cover the principles and practices connected with the improvement of domesticated animals and plants. It is derived from evolution in general in that its ultimate purpose is utilitarian. The breeder is interested in definite results, whereas nature is supposed to be indifferent to everything but the "survival of the fittest". In thremmatology it is not to make the creature "fit" the conditions of life, but rather to bring both the creature and conditions to harmonize with the highest needs and purposes of man.

This brings to the surface in thremmatology, as a question of prime importance, one that is curious rather than otherwise in evolution, namely: Can the conditions of life be employed directly to influence deviation in the desired direction independently of selection; in other words, can individual modification become hereditary, or as the expression goes in general evolution, are acquired characters inherited?

All students agree that the development of individuals is strongly modified by the conditions of life, that is, the environment. Out in nature if these modifications are not inherited it implies only a little more work for selection, and the final result is the same whether this act is applied or not. The answer to the question is interesting, therefore, rather than vital, as the study is confined to general evolution but in thremmatology the answer involves a vital principle because the breeders, especially of animals, cannot afford unlimited selection. All the animals represent money, the owner is interested in getting results and a minimum destruction of values. He is interested, too, in securing improvements rapidly as possible, because time is money and the necessity for selection is reduced, both important considerations on a business standpoint. Upon the answer to this question will depend the kind of soil and employed in plant breeding, the daily care, shelter, the amount and character of feed provided for breeding animals, as well as the quality of exercise and training where speed, intelligence are involved. That these are important in the development of the individual are agreed, but it is also necessary to be provided for breeding stock for the offspring.

Evolutionists in general are interested primarily in form, while the thremmatologist is concerned very largely, if not mainly, in function. The size or shape of the cow is of importance than her ability to produce certain amounts of feed into milk and do it economically. This faculty depends directly on the functional ability of a very limited part of the body and not so much upon the form of the horse. The ability of the horse to attain speed depends not only upon his conformation but quite as much upon the quality of the motor parts, whether active or sluggish, the mental make-up, whether well balanced or erratic. Functional activity is, therefore, much more interest in thremmatology than the general evolution, and functional variability recognized as one of the principal oppositions for improvement.

The systematic study of thremmatology covers the following topics:
1. A working knowledge of the theories and concepts of general evolution.
2. The kinds of variation; namely, positive, relating merely to size; meristic, to pattern; and functional, relating to activities.
3. Continuous variation in which all are presented for selection, and discrete variation in which some values seldom or never occur, as in the case of sports, in photography and as it is involved in the process of orthogenesis.
4. The causes of variation, first, as between different individuals of the same general second, as between different individuals of the same parentage but of different genera, third, as between different individuals of the same parentage and the same general species, representing different generations, fourth, as between succeeding generations of the same species, representing different races; fifth, modifications in the individual during its development, plainly due to deviations of life, rather than to heredity, different uses of the term variation being kept distinctly in mind, so that it is permissible to use the word "deviation" for the former and "modification" for the fifth form of variation usually called variation. These are subdivided into two groups; first, selective
ions touching the basis of selection; secrecy environment, raising all questions of extent of the conditions of life, acclimation, and the inheritance of modifications or characters.

Statistical studies of heredity in order to act the array, eliminate chance, determine the laws of regression and pangen and the relative influence of parents. Correlation, as determined by correlation and useful as indexes of valuable characters.

The practical selection of breeders achieved by a full appreciation of the financessidersations involved, and the relation of performance and breeding powers as indicated by livestock records.

The testing of sires as a final basis of choice.

The importance of selecting for prolific among both animals and plants, and advantages of vigor and longevity.

The disturbing effect of fashion, and the methods of meeting its demands in breeders, and it is important in the study of this phase of the situation of the breeder in mind comprehensive ideas of general evolution that he be not a blind adherent of any r dogma, and that be free his mind from s of traditions that serve only to cloud judgment and deter progress. For example, has been held as a general principle that early planting is necessarily fatal to fecundity and produce, yet wheat, one of our most vigorous prolific crops, is systematically sown. The first lessons the breeder should therefore, is what is true of one is not necessarily true of all species.

at has been accomplished by way of increase, and it is much, has been gained exclusively by selection, and under disadvantageous circumstances. For example, among animals and some plants, there are too few for the best selection and repeated attempt to establish a small high-class animals has been as often relative for the reason that numbers are too cheap material for proper selection to maintain the initial standard, to say nothing of improvement.

Well-nigh universal practice of using sires is fatal to the most rapid progress, such cases the selection has been made full development. Thus some of the specimens are accepted because preposited at an early age and many of the best scared which if given time to fully make would prove their right to exist. Practice among the better breeders extending toward larger numbers, better races of life, the selection of more animals, followed by an actual breeding struggle in smaller numbers of these that have their basis in utility, and an ideal standard that, once adopted, is self-sustaining, if at all, would be expected the most rapid progress has been made in those breeds or varieties of animals and plants in which practically all the individuals can be put to the performance test. For example, it is comparatively easy to get a record from a cow or a speed horse and to know what the one can do at the pail or the other on the track. On the other hand it is impossible to put a meat animal in a test without sacrificing the individual as a breeder. Accordingly breeders of beef cattle, swine and other meat-producing animals have been working somewhat in the dark and to relieve the situation many have felt obliged to sacrifice on the block some of their best bred animals in order to test their standard of selection and verify their methods of breeding.

The improvement of animals and plants is a difficult and often a money-losing enterprise, but it is fascinating because of what is possible. By breeding, the sugar content of beets has been increased from 3 or 4 per cent to 12 and even 20 or more per cent. Corn has been bred richer in nitrogen than is wheat, and its oil content is raised or lowered at will. So far as is known any character may be substantially improved and the upper limit of improvement has never yet been reached with any animal or plant.

Many plants, and some animals, have received little attention at the hands of the breeder, and have either become extinct or else exist among us with little or no improvement, except such as has naturally followed upon better general conditions. Conspicuous examples are clover and alfalfa among legumes; timothy and other non-grain producing grasses; asparagus, salsify and many other vegetables and most shade and ornamental trees.

Cats breed without attention and their variations do not, therefore, become fixed. The American bison was allowed to become extinct, but because he would not have become useful if carefully bred, but because he was too near like common cattle to repay the trouble of domestication. In the same way the common hen prevented the domestication of the prairie chicken, but fortunately no real rival stood in the way of that truly American bird, the turkey.

Thus has threemamotology lost much valuable material, but notwithstanding this there is yet at hand awaiting the attention of the master much that is full of undeveloped possibilities, and with the development of our knowledge of the principles underlying heredity and variation great improvements in methods of breeding may be confidently expected.

EUGENE Davenport.
Dean of the College of Agriculture, University of Illinois.

THRESHER SHARK, or FOX SHARK, a well-known shark (Alopius vulpes), with a short conical snout and less formidable jaws than the white shark. The upper lobe of the tail fin is very elongated, being nearly equal in length to the rest of the body, and is used as a weapon by which this shark is able to kill or disable many fishes in a school, when he rushes into the midst of the crowd and lays about him. Tail included, the thresher attains a length of 13 feet. It inhabits the Atlantic and the Mediterranean.
THRESHING MACHINES. See Farm Machinery.

THIRT, a stemless fleshy herb (*Statice armoria*) of the seacoasts of the world. It has tufted rosettes of linear leaves with no perceptible difference between blade and petiole and white, pink or purple five-parted flowers, with calyx lobes nearly or quite sessile in compact heads terminating an almost naked scape, and are subtended by brown, dry bracts, the two lowest reflexed, and partly united into a sheath. Thrift is otherwise known as sea-side or lady's dressing, and is occasionally cultivated for flower-borders.

THRING, Edward, English schoolmaster and author: b. Alford, Somersetshire, 29 Nov. 1821; d. 22 Oct. 1887. He was educated at Eton and King's College, Cambridge, and after taking holy orders and serving as curate at Gloucester and elsewhere, in 1853 was appointed head master of Uppingham School. From an institution run down in efficiency and reputation he made it one of the healthiest, best equipped and flourishing public schools of England. No schoolmaster since Arnold was more successful in imprinting on the characters of his pupils a high ideal of duty as the great end of life. His own earnestness and honesty, his firm discipline and stern denunciation of cowardice and wrong gave character and reputation to the school. Among his published works are 'Thoughts on Life Science' (1869); 'The Theory and Practice of Teaching' (1883); 'Uppingham Sermons' (1886); 'Poems and Translations' (1887); and 'Uppingham and School Life' (1887). Consult Parkin, 'A Memory of Edward Thring' (1898); Skrine, 'Uppingham by the Sea' (1878).

THRIPS, a genus of minute insects, order Hemiptera, suborder Homoptera, closely allied to the Aphidoidea. They are extremely agile and seem to leap rather than fly, whence the common name "leaf-hopper." They live on flowers, plants and under the bark of trees. *T. cercealum* is a common species, scarcely a line in length or in extent of wing, residing in the spathes of husks of cereals, especially wheat, to which it is most injurious.

THROAT, the front of the neck, including the structures below the chin and above the collarbone, and also, by an extended usage, the passage from the mouth to the stomach (fauces, pharynx and oesophagus), and the passage from the mouth to the lungs (larynx and trachea or windpipe), these being the passages for food and breath. The throat and its various structures are subject to many diseases, some of which are among the most difficult with which medicine has to deal. See Nose and Throat Diseases.

THROMBOSIS, the formation or development of a thrombus (q.v.) in the heart, blood-vessels, lymphatics or other ducts. It is essentially the coagulation of fibrinogen and is usually, indeed by some condition which retards the flow of the blood, lymph, etc., such as stasis or other structural change in the lining membrane of a vessel or the presence of some foreign body or some alteration in the constitution of the blood, lymph, etc. In the heart and arteries it seldom occurs unless their lining membranes are roughened or their interior is so much impaired that the blood is not forcibly and readily propelled on. It is most frequent in veins, where stagnation is naturally slow, and it rarely occurs in capillaries. The thrombus formed may dry into a leather-like substance, forming phleboliths (in veins) or soften and be absorbed or suppurate; or they may, as after the ligaturing of an artery, become the propelling power of the heart, as in marasmus and exhausting diseases and after a septic or bacterial infection of the blood. The symptoms of thrombosis are those of the arrest of circulation and differ according to the vessel affected. They include passive hyperemia, venous distention, swelling of adjacent parts, anasarca of an extremity, etc. The treatment varies according to the seat of the thrombus.

THROMBUS, in anatomy, a plug or mass of blood coagulated and formed in a vessel and partially or wholly obstructing its lumen. If it remains at its place of origin it is called a primary thrombus; if it grows beyond its original limits it is a detached thrombus; carried by the blood from a distant blood vessel and forced into a smaller one, obstructing the circulation it becomes an embolus. A thrombus consists of agglutinated fibrin entangled in its meshes and white blood-corpuscles or of coagulated red blood-corpuscles, in lymphatics, and the term thrombus is applied (milk thrombus), to an accumulation of curdled milk in a lacertaceous tube. Thrombi are designated by various names according to their color, causation, shape, etc. Thus a silent thrombus is one which contains no air or is composed of red blood that is not colored by red blood; traumatic, one resulting from an injury; infective, one occurring as the result of septic or bacterial poisoning; annular, one which has an opening in its centre, the circumference being attached to the wall of the vessel; and membrane, one whose substance is disposed in layers, may differ in material. Thrombi, if remaining at the point of origin, may cause no harm, but they are liable to be carried away and to become dangerous in the vessels they block up the lumen of a vessel, with rise to pain and swelling and to loss of function in parts of the body more or less affected. See Thrombosis.

THRONE, a chair of state or superior rank, occupied by a sovereign, bishop or minister. The modern throne is usually a raised arm-chair of great size, raised on a pedestal and covered with a canopy, more or less ornamented. Anciently the throne was wooden; its design of marble, decora- tions of precious stones, and was frequently surmounted by pillar- or figures representing .

THROOP, Enos Thompson, 2nd governor and diplomat, b. John X., N. Y., 21 Aug. 1874; d. Auburn, N. Y., 1874. He studied law at Albany and there began a life-long friendship with Van Buren. He took up practice of Auburn in 1807 where he soon entered.
postmaster and county clerk. He was a member of Congress in 1814 and in pointed circuit judge. It fell to his lot he Morgan abduction case and his serv- tice was called to the bar. When urgent request, he resigned to his name to be placed on the State with Van Buren in 1828 and on the becoming Secretary of State to Presi- dent Polk in 1841, Throop became a and was re-elected the following year as naval officer at the port of ofr, 1833–38, when he was sent by Presi- dence of Burens as chargé-d'affaires to the n of the Two Sicilies (Naples). Re- ceived this post on the election of Harri- spent two years at Paris and then re- moved to private life. From 1847 to brought a farm of 800 acres at Kala- Mich, to high cultivation. In the lat- he retired from activity to his former- ce. Willowbrook, Auburn, N. Y., were s nephew, E. T. Throop Martin, and he shared the friendship of Secretary and entertained such prominent visitors hington Irving, Jenny Lind and mem- ters of the liberal arts and sciences. ROOF, Montgomery Hunt, American b, Auburn, N. Y., 26 Jan. 1877; d. N. Y., 11 Sept. 1892. He was educated at Union College in 1846; was admitted to the bar in 1848 and practised in Utica with his father (1854–56), and with Roseoe- g (1856–64). He removed to New used his influence in the State legislature and was appointed commis- sioner of the State to revise the Code Procedure (1877) and removed to in 1880 to devote himself to the publi- cation of books. He published 'The political Essay' (1864); 'The of Verbal Arguments' (1870); 'The of the Supreme Judicial Court of uscetts' (1887); 'Revised Statutes of the State' (1888).

ROOF, Pa., borough in Lackawanna near Scranton, and served by the New Jersey and Western and the Delaware, and several Western railroads. Coal-min- ing is the chief industry and there is also a silk operation. Pop. 5,133.

ROOF (troop) POLYTECHNIC IN- TE, located at Pasadena, Cal. It was in 1891 by Amos G. Throop to provide and practical education for both sexes, irely non-sectarian, the charter provides a majority of the trustees "shall not o any one religious denomination." Its tion comprises five schools: (1) the r school; (2) the academy; (3) the rial school; (4) the normal school; (5) ge. The academy offers three courses, literary and scientific; and the col- cource, courses, in engineering, electrical in, and mechanical science, all leading to the B.S. Some courses in each are required, and some elective. But the grammar and high school manual training is a regular part of curriculum; instruction is given in wood sloyd, carpentry, forge work, machine- work, clay modeling, mechanical and free- hand drawing, sewing and domestic science. The commercial school provides a two years' course; and the normal school three two years' courses in manual training, domestic economy, and in drawing are described in the description which include psychology, pedagogy and his- tory of education. There is also a summer school of art and manual training, designed mainly for teachers; work done in this school is credited toward a normal diploma. The in- stitute (1904) occupies two buildings, Poly- technic Hall and East Hall. The library in 1917 contained 7,000 volumes; and the Pasadena Public Library is also open to students. The productive funds amounted to $100,000, the students numbered 154 and the instructors 38.

THROSTE, a Scotch name, like "mavis", for the British song-thrush (q.v.).

THRUSH, a bird of the passerine family Turdidae, a family which contains some of the most familiar and attractive birds, and most of the best songsters of the world. They are predominantly migratory. A few are only five or six inches in length, but the American robin (q.v.), eight inches is a typical form; and most of them are of pleasing form and pleasingly but not gaudily colored. The thrushes are divisible into five subfamilies. The thrushes proper (Turdinae) are represented by such familiar forms as the American bluebird, robin, wood thrush, northern hermit and olive-backed thrushes, noted for their rich melodious songs, the English blackbird, song thrush, missel thrush and fieldfare, besides the nightingale, robin-red breast, hedgesparrow and many related forms in other parts of the world, most of which are elsewhere described under their names. Three American thrushes of this group call for brief mention, namely, the hermit thrush (Hylocichla guttata), which is migratory through the Eastern States, breeding in the far north, and is noted for its beautiful song, which has been said to express "serene religious beatitude"; the olive-back or Swain- son's thrush (Hylocichla mustelata), distinguished by the olive tint of its upper parts, and also a sweet-voiced emigrant to Europe, is the tawny thrush (see Vehr). In all of these the young are spotted, although the adults may be uniformly colored.

The second subfamily is composed of the genera Myioborus and Cichlipsis. The third contains the Old World warblers (Sylvinae), fantails, kinglets (sylviinae), and the like; the fourth (Poliolopitinae), the gnat-catchers (porellinae), and the fifth (Miminae), the mocking-birds, thrushers (q.v.), and related forms, many of which seem to imitate other birds, composing their own songs out of a medley of other notes, although the report of this tendency has usually been exaggerated; this last subfamily is by the most modern ornithologists separated from the thrushes and put with the wrens. Consult Evans, 'Birds' (New York 1901).

THRUSH, a form of parasitic stomatitis, due to the presence in the mouth of the thrush-fungus, white-moutre or sprue. (See MOUTH). The disease usually occurs in infants, but may appear later in life, even in old age, in association with some severe acute illness or some wasting disease, as pulmonary tuberculosis. The patches of thrush (techni-
THRYSTH—Thucydides

cally aphthae) are most commonly found on the dorsum and edges of the tongue, on the hard palate and on the inside of the lips and cheeks. The eruption is usually tender. The fungus may enter and even be formed in a healthy mouth, it will not flourish there. Inflammation or other abnormal condition of the mucous surface, and acid secretions, cause it to grow and develop. Thrush may be propagated from one babc to another through an infected nipple of a nurse, or by means of infected spoons, feeding-bottles, teats, etc. Usually the mucous membrane of the mouth underlying the fungous patches is of a bright or livid red, but when the system of the patient is much deteriorated, and the mycelium has penetrated deeply, shallow ulcerations may result. Sometimes the fungus of thrush is found in the pharynx, in the trachea, bronchi, and other places.

Of itself thrush is not dangerous, but it is usually significant of a deteriorated state of health, even in apparently healthy children, it lasts but a few days; in children having gastro-intestinal catarrh and diarrhoea, and who are much debilitated, it may last for weeks, fresh spots appearing as others vanish. The redness and excretion around the anus and adjacent skin of infants so affected is vulgarly regarded as an indication that the "thrush has run through the patient," and if the mouth condition has improved it is considered a favorable sign. While the thrush-fungus has been found in the esophagus, and even lower in the alimentary canal, there is no reason to believe that it is the cause of the redness and excoriation above referred to, which are rather due to a superficial dermatitis resulting from an excess of starchy food and a vitiated blood state.

Strict attention to diet is necessary in treatment; diminish the amount of sugar and starchy food, and give milk and lime-water. The mouth must be kept clean, and the chance of action of acid or alkali fluids, such as lime water or Vichy, a solution of borax and glacialic acid, or of sulphate of sodium, should be frequently sprayed upon the patches or applied with the fingers, covered with soft cloth. The general health is to be maintained by tonics, hygienic measures and relief of debilitating ailments.

THRESH, in veterinary surgery, a diseased condition of the frog of the horse's foot appearing as a severe and acute inflammation, which usually proceeds to ulceration, and which is accompanied by a fetid discharge. It is most frequently seen in horses of unsound constitution, and especially appears in stables where drainage and cleanliness are deficient. The best application for it is mineral tar. Calomel dressing is to be substituted for the tar in other cases. Administering in doses, and ulcerated and loose parts of the frog are to be carefully removed. Consult "Report on Diseases of the Horse" (United States Bureau of Animal Industry, Washington, D.C.).

THRUSS FAULT. See Fault.

THRUSTON, Lucy Meacham, American novelist: b. King and Queen County, Va., 20 March 1862. She was graduated from the Maryland State Normal School in 1880, and was married to Julius Thruston in 1884. She has published 'Mistress Betsy,' a novel; 'A Month in Virginia' (1902); 'Jack and His Island' (1902); 'Where the Tide Comes In' (1904); 'Called to the Field' (1906); 'Jenifer' (1907); 'The Heavens of the Unexpected' (1910).

At the time there were at
0 Thugs plying their hideous trade;
 natives vanished annually, leaving
behind. In the midst of this reign of
savior suddenly appeared in the per-
son of Captain (afterward Maj.-Gen. Sir Wil-
liam) Sleeman, a junior official in the service
of the East India Company. He began Thug-
hunting in 1830, with the title of "General
Superintendent of Operations against Thuggee,"
conferred on him by Lord William Bentinck.
An Irishman, Molony, had captured a roving
band of 115 Thugs in 1823, while another gang
was seized in 1826. Within five years Sleeman
had thousands of them in prison; 20 Thugs
confessed to him that they had participated in
5,120 murders; one, Buhram, who had been a
strangler for 40 years, had 931 murders to his
discredit; Ramzan had 604, and Fatty Khan
508. Sleeman broke the back of the organiza-
tion. Up to October 1835 no fewer than 1,562
Thugs had been committed; 382 were hanged
and 986 transported or imprisoned for life.

Editorial Staff Of The American.

THULE, thül'e (Greek, ðtholj), a name
given by the ancients to an island or group of
islands in the ocean to the northwest of Europe.
It was thought to be the northernmost inhabited
region of the earth. It is believed to have been
the Shetland Islands, though some have
identified it with Iceland, and others with both
Norway and Jutland. The term "ultima
Thule" was used by the Romans whenever
reference was made to the furthest distant
unknown land.

THULITE, a rose-pink variety of the
mineral zoisite (q.v.).

THULSTRUP, Thure de, American artist:
b. Sweden, 1848. Graduated from the National
Military Academy at Stockholm, he entered the
Swedish army in 1865; served in the Franco-
Prussian War and was present at both battles of
Lyons. He served also in Algeria as an officer
in the French army. After studying
drawing in Paris he went to Canada, later com-
ing to the United States. In 1872 he joined the
staff of the Graphic as illustrator; was con-
ected with the Frank Leslie publishing house
in the same capacity from 1876 to 1880; when
he entered the employ of Harper Brothers. He
is especially well known as a military and his-
torical illustrator.

THUMAN, too'män, Paul, German
1834; d. 1905. He represented a student at the
Academy of Berlin from 1853 to 1855 and sub-
sequently worked under Julius Hubner in
Dresden till the year 1860. At Weimar he stud-
ied with Ferdinand Pauwels and in 1866 was appointed professor in the art school of that city. From 1875 to 1887 he filled the duties of professor in the Art Academy of Berlin. He was mainly occupied in the illustration of Auerbach’s ‘Kalender’; Goethe’s ‘Dichtung und Wahrheit’; Tennyson’s ‘Enoch Arden’; Chamisso’s works; and Heine’s ‘Buch der Lieder,’ etc. His success in this work was due to the powerful drawing, thoughtfulness, and genuine feeling which characterized his style; yet latterly he lapsed into a certain sickly sentimentality and frivolity of treatment which injured the reputation won by his early productions. Among his paintings the best are five canvases which illustrate the life of Luther, executed for the castle of Wartburg; ‘The Vision of St. Gertrude’; ‘The Bribe of Hermann from the Battle of Teutoburg Forest’; and ‘The Three Fates.’

THUN, Bern, Switzerland, (1) a lake in the canton of Bern, 10 miles long by two miles broad. Its surface is over 1,800 feet above sea-level and its greatest depth 712 feet. It forms the outlet of the Aar, which leaves it at the northwest. The lake is enclosed by gentle slopes, covered with villas and orchards, except beyond Sigriswil, where the north bank is more precipitous. The scenery is idyllic. Fish are plentiful, especially eels, carp, pike, etc. Steamers run from Thun to Interlaken, and an old road follows the coast toward the south, a new one toward the north. The important towns along the banks are Oberhofen (health resort), Spiez and Simmerthal. The first steam navigation of the lake was inaugurated in 1835. (2) The town of Thun in the canton of Bern is one mile distant, and is the station for travelers touring the Bernese Oberland. It is the principal military arsenal of Switzerland and here is located a military institution for army officers. The noteworthy buildings are the Gothic church and the old 12th century castle. The manufacture of bricks and pottery forms the main industry. Thun was the capital of the Oberland of the Helvetian Republic (1798–1802). Pop. 7,885.

THUNDER. See LIGHTNING AND LIGHTNING-RODS.

THUNDER-BIRD, an imaginary bird occurring in the mythology of races of low culture, and personifying thunder or its cause. Among the Caribs, Brazilians, Algonkins and various other North American Indians, and among the Karoos of Shiu, the South African Brehuaus and Basutos, and other aborigines, there are legends of a flapping or flashing thunder-bird, which seem to translate into myth the thought of thunder and lightning descending from the upper regions of the air, the home of the vulture and the vulture.

THUNDER CLOUD, Mohawk Indian chief and army scout; b. Canajoharie, Canada, about 1856; d. Rochester, N. Y., 1910. He became noted during the Indian troubles (1872–76) and rendered valuable assistance to the United States army, being one of those who had the chief Red Cloud. In civil life he became celebrated as an artist’s model and posed for the leading painters of Indians and Indian scenes. Frederick Remington used him frequently and he appears in various histori cal groups in the capital at Saint Paul, the work of Millet and others, head appears on the gold coin of the United States for which Victor Brenner selected profile.

THUNDERBOLT, The, a comedy, by Sir Arthur Wing Pinero, represents work of one of the most gifted contemporary English dramatists. In it are most of the theatrical ideas that constitute the common stock in the playwright’s craft and which he was to use with consummate ease and deftly. He modestly describes ‘The Thunderbolt’ as ‘The fun in the life of a rich family.’ We are introduced into a family conclave of the Edwardian era, the only member who has wealth, lies dead upstairs. He was a family man, although he had been estranged from his or her and sister for many years, his next of kin and presumably for, to their delight, surprise, he leaves his will to nor made any will whatever for the young woman who is to be his daughter and whose life has supported lavishly and affectionately. The reactions of the various members of the family to this situation as it develops are portrayed with a ruthless truth and simplicity that remind one of Balzac rather than of the work of ‘Sweet Lavender,’ ‘The Maestro’s Daughter,’ ‘The Second Mrs. Tanqueray.’ One influence of the conversational play is in Granville Barker but in ‘The Thunderbolt’ it is real talk of quite ordinary people, forwarding the movement of the drama, halting it for philosophical discussion or dilatory monologue. Pinero is so enamored of this new realistic method that he sacrifices the opportunity of an effective curtain and acts as a third act. The family is again in conflict, the thunderbolt has fallen, there is leaving everything to the daughter, Thaddeus, having just been forced to that it was his wife, not himself, who found and destroyed this will, then, in the room with a frantic but futile appeal to the family and the lawyers: ‘Oh, my God, I’m the one! Don’t you know she head! Don’t you touch her! A good wife to me!’ Instead of a scene on this poignant note, Pinero lingered to watch the exasperated family and lament over the money they see through their greedy fingers. But glibly, and petty as they are, the human, and James’ frank states, ‘The money really mean,’ reconciles one to the solution by all get a share, although Helen is perhaps the least natural thing. She is not a very appealing heroine, the other characters are people one it possible in real life. There is no interest, no sex problem, no fun, and action. In view of the lack of popular appeal it is not surprising. Thunderbolt’ has not been one of the conspicuously successful on the stage but the real lover of the drama and to the life, it is his most important play.‘
THUNDERING LEGION—THURLOE

THUNDERING LEGION. See Legion, Thundering.

THÜNEN, tü'n'en, Johann Heinrich von, an economist: b. Oldenburg, 1783; d. 1850. Received a thorough education in agriculture also studied art at Hanover 1810 he rented an estate in Mecklenburg-Schwerin, he developed into a model farm. He is now principally for the economic views, in 'Der isolirte Staat in Beziehung Landwirtschaft und Nationalökonomie' 1820-63. In this work he sets down: premises in regard to wages and land, action, markets, etc. His law of wages and favor among more recent economists. II. Paigrave, 'Dictionary of Political Economy' (3 vols., London 1899) and Schuer, H., 'J. H. von Thünen, ein Forscher' (2d ed., Rostock 1883).

THURBER, George, American naturalist: b. Providence, R. I., 2 Sept. 1821; ssaic, N. J., 2 April 1890. He was educated at the classical and engineering school at Rensselaer and became a pharmacist and a lec- onology, finally securing an appointment (1850) with the commission to settle the area between the United States and to. He made an important collection of birds and on his return to Providence was the degree of A.M. by Brown University, cured an appointment in the Assay Office at York, lectured on botany in Cooper and on botany and materia medica in New York College of Pharmacy. Later he was the chair of botany and horticultu- n the Michigan College of Agriculture but again to New York and to lecture at college of Pharmacy and finally became of the American Agriculturist for 24 In (1889) he was elected member of the Royal Horticultural Society, member of the American Pomological Society and corresponding mem- f the Philadelphia Academy. His collection of western plants is in the Gray Herb at Harvard.

THURGAU, tu'rgow, Switzerland, a canton, northeast, with an area of 381 square miles. Unlike most Swiss cantons it has no elevations, but a diversified surface, most high is productive. It belongs to the Basin and is chiefly watered by the Thur. There are extensive forests, and rable lands yield a limited amount of and potatoes and grapes—fruit is ant. Stock-raising and dairying are also important. Manufactures consist of linen and m cloth, ribbons, lace, hose, hosiery, muslin, and wooden articles. There is consid- trade, owing partly to Lake Constance and Rhine on its borders. The canton was reformed in 1798, although it had been in pos- of the Swiss from 1460. For nearly a year prior to that time it belonged to the of Hapsburg. The capital is Fravenfeld. of canton 140,540. See Switzerland.

THURIBLE. See Censer.

THURIFER, in Roman Catholic Church services, the attendant at High Mass, Solemn Vespers and Benediction, who uses the thurible, either by simply waving it to and fro or for incensing the clergy, choir and congregation, and who at certain times presents it to the officiating priest that he may incense the altar or the Host. Strictly speaking, the office of thurifer belongs to the acolyte, the highest of the four Minor Orders, but all the functions of the acolyte are now freely performed by laymen.

THURINGERWALD, tü'ring-er-walt, or FOREST OF THURINGIA, Germany, a series of mountain ranges centrally located, extending from the Werra near Eisenach southward as far as the valley of the Rodach. The ramifications toward the southeast and the west connect it with the Frankenwald and the Rhön Mountains. The highest elevations are found in the Grosser Beerberg (3,228 feet), and the Schneekopf (3,201 feet), west of Zelle. The entire mountain range is covered with evergreens and leafy trees and its slopes and valleys present charming landscape and views. The principal streams are the Gera, Wipper, Ilm and Schwarza, flowing into the Unstrut and Saale; the Rodach and Steinach and Itz; and the Werra with its affluents—the Hörsel and Leine. There are rich deposits of iron, copper, cobalt, lead and, in the neighborhood of Friedrichroda, ala- baster. The valleys and slopes are the home of an active industry, including porcelain factories, glass-works, wooden manufactures, especially toys, slate, meerschaum and other pipes, fire-arms and celebrated pottery. Thüringerwald is much frequented by tourists, and the transportation and other facilities are unsurpassed.

THURINGIA, Germany, territorial name still borne by that part of Upper Saxony generally bounded by the Werra, the Saale and the Harz Mountains, though it has no longer any political significance. It was once a much more extensive territory. The name was derived from the Thuringian tribe which occupied it in the 5th century. Much of its area is covered by the Thüringerwald (q.v.). Erfurt is the largest city. The region has had a chequered history, falling in turn to Thuringia, Franconia, and Carlowingan. It was in turn a kingdom, duchy and margrave. (See Saxe-Weimar.) Consult Devrient, Ernst, 'Thüringische Geschichten' (Leipzig 1907); Knobenhauer, Thomas, 'Ge- schichte Thüringens in der karolingischen und sächsischen Zeit' (Gotha 1863); 'Geschichte Thüringens zur Zeit des ersten Landgrafenhauses' (ib. 1871).

THURLOE, John, English statesman: b. Essex County, 12 June 1610; d. London, 21 Feb. 1668. He studied law, was admitted to Lincoln's Inn in 1647, and appointed to a government post in 1648. He took no part in the political events leading to the king's death. On 29 March 1652 he was appointed Secretary to the Council of State under Cromwell; and was also given control of the intelligence department, which duties he performed so remarkably well that it was said that the enemies of the Protector made no move without detection by Thurloe or his assistants. He stood high in Cromwell's regard and enjoyed his confidence to a greater extent than any other adviser. He served in the Parlia-
ments of 1654 and 1656, and was reappointed Secretary of Cromwell's Council of State in 1657. He became chancellor of Glasgow University in 1658. He supported Richard Cromwell's successor, the son of Oliver Cromwell, sat in the Parliament of 1659, continued prominent in government affairs and in 1660 was reappointed Secretary of the Council of State. After the Restoration he was arrested on a charge of high treason 13 March 1660, but was freed subject to attending the secretaries of state whenever they should require his services. His correspondence is in the Bodleian Library, Oxford, and is an important source of historical information. A part of it was published with a biographical sketch by T. Birch (1742).

THURLOW, thür'lō, Edward, Lorp, English lord-chancellor: b. Bracon Ash, Norfolk, 9 Dec. 1731; d. Brighton, Sussex, 12 Sept. 1806. He was educated at Caius College, Cambridge, subsequently entered the Middle Temple and in 1754 was called to the bar. In 1761 he was appointed the king's counsel, and was employed to prepare the evidence for the appeal in the great Douglas cause, which, however, did not come on for hearing in the House of Lords until 1768. In 1768 he was returned as member of Parliament for Tamworth, and became a constant supporter of Lord North's administration. In 1770 he was made solicitor-general, and Attorney-General in 1771. In 1778 he was appointed lord-chancellor, and raised to the peerage as Baron Thurloe. The personal favor of the king retained him in office during the Rockingham administration, whose measures he actively opposed, but he was compelled to resign on the dissolution of the ministry in 1783. He was still considered the confidential adviser of the king, and on the dissolution of the coalition ministry at the close of the year the great seal was restored to him by Pitt. In 1788 the king's illness rendered it necessary to consider the contingency of a regency and Pitt suspended Thurloe in intrigue with Prince of Wales. Thurloe then began publicly to oppose the measures of his colleagues, particularly Pitt's scheme for maintaining the sinking-fund, in the House of Lords, whereupon Pitt demanded his dismissal, to which the king at once agreed. Consult Campbell, 'Lives of the Chancellors'; Foss, 'Judges of England' (London 1848-64).

THURMAN, thür'man, Allen Granbery, American lawyer and politician: b. Lynchburg, Va., 13 Nov. 1813; d. Columbus, Ohio, 12 Dec. 1898. He was brought, in childhood, to Chillicothe, Ohio, and there received an academical education. After teaching for a time he studied law in the office of his uncle, William Allen (q.v.); in 1835 was admitted to the bar and forming a partnership with his uncle soon attained success as a practicing lawyer. At the same time that he began his legal career he became active in politics as a member of the Democratic party, but held no political office until 1841 when he was elected to Congress. He was one of the earnest supporters of the Union in the conflict in the Mexican War; though a Democrat and opposed to any change in the Missouri Compromise (q.v.), he, with the most of the Northern Democrats, voted for the Wilmot Proviso (q.v.), and replied to Southern criticism of this act in a speech railing, forcibly, the reasons of the North for opposing the extension of slave territory. At the close of his Congress term he resumed the practice of law, and in 1851 was elected one of the judges of the Ohio Supreme Court; here his learned and able decisions won him wide reputation as a jurist. When his term of office expired in 1856 he again took up the practice of his profession, this time in Columbus. He took no active part in politics until 1867, when he was nominated by the Democrats as governor of Ohio; he conducted a vigorous campaign, and though defeated by a small plurality, the Democratic party carried the legislature. In the next year he was elected to the United States Senate and re-elected in 1874. His ability in debate won him immediate recognition, and he was appointed a member of the Judiciary Committee, and became the leader of his party in the Senate; during his last term he was elected president pro tem. He favored a liberal policy of reconstruction, introduced the so-called Thurman Bill compelling the Pacific Railroad to comply with the acts of Congress for its franchise, and succeeded in effecting the passage of this bill against a powerful opposition. In 1876 he was a member of the Electoral Commission (q.v.), and steadfastly supported the claims of Tilden. He was a leader in the Democratic Presidential nomination in 1876, 1880 and 1884; in 1881 he was appointed a member of the Paris Monetary Conference. In 1888 he was the Democratic nominee for Vice-President and took active part in the campaign; after the defeat of his party in that year, he retired from political life. Consult Hensel and Parker, 'Lives and Public Services of Grover Cleveland and Allen G. Thurman' (Philadelphia 1892).

THURN, Henry Matthia, Count, Bohemian Protestant military leader: b. 1580; d. 2 Jan. 1640. He served in the Turkish War and for his services was made Burgrave of Karlstein, Bohemia, by Emperor Rudolph I; he was deprived of his estates, however, after he was named one of the Thirty Thousand of the Faith by the Bohemian estates. He was called to the Bohemian Protestant insurgents at the beginning of the Thirty Years' War in 1618; invaded Austria and unsuccessfully besieged Vienna in 1619; and was decisively defeated at White Hill in 1620. He afterward served in the Swedish army; and in 1632 fought under Wallenstein at the defeat of Lützen.

THURSDAY, the fifth day of the week, so called from the old Teutonic god of thunder, Thor, the northern Jupiter. The German name Donnerstag is of similar origin; and Thun, Donner, are equivalent to English thunder. Ascension-day is often called Holy Thursday.

THURSDAY ISLAND, Queensland, a small island in Torres Strait, 30 miles from Cape York. It has an excellent harbor. Port Kennedy, which is a port of call and trade depot. Pop. about 2,000.

THURSTON, John Mellen, American statesman: b. Newburyport, Vt., 21 Aug. 1847; d. Omaha, Neb., 9 Aug. 1916. His parents took him to Wisconsin, where he was educated in the public schools. He received his educa-
Wayland Academy at Beaver Dam, Wis., 1869 was admitted to the bar. Soon after he went to Omaha, Neb., where he most of his life. About 1873 he was a 1r of the city council and was city a of the United States Naval Academy, Nebraska legislature as a Republican and presidential elector in 1880. Soon after became counsel for the Union Pacific ad. In 1893 the Republican caucus nominated him for United States Senator, but he didn't go to Washington until 1895. He re- 1 until 1901. He seconded the nomina- 

of William McKinley for President in vacating the chair at that convention to From 1889 to 1891 he was president of residential Republican League. In 1901 he was a commissioner of the Saint Louis tion.

URSTON, Robert Henry, American er and educator, b. Providence, R. I., 25 August 1839; d. Ithaca, N. Y., 25 Oct. 1903. He accepted a position at Cornell University in 1859, received his mechanical training in his own engine-building shops. In 1861 he joined the army corps of the navy, served during the Civil War, was twice promoted, and in 1865 appointed assistant professor of natural philosophy at the United States Naval Academy. He resigned his commission in the navy, accepted the professorship of mechanical engineering at the Stevens Institute of Technology. He was appointed a member of the first scientific commission to the Exhibition in 1873, and in 1885 became rector of Sibley College, the engineering department of Cornell University, and university professor of mechanical engineering. The Sibley College curriculum is due to his ability as an organizer, and minimization made the college one of the most important engineering schools of the country. Invention he was known for his magazines, ahh and navySignal, various forms of testing machines, and other metals, and an engine-gov- ord and other improvements on the steam engine. In scientific research his most noteworthy work was done in investigating the steam-turbine, the development of the steam-engine, and certifying the useful qualities of various. His contributions to engineering and fic literature are also of value, being a rather clearness of statement unusual in the field. The most important of his publications are 'Materials of Engineering,' 1884; 'new ed., 1900; 'Manual of Steam Engine,' 1890-1902; 'Manual of Boilers,' 1888-1901; 'Engine and Fire,' 1899; 'History of the Engine,' 1878-1902. Others are 'Manual of Construction,' 1884; 'Materials of Construction,' 1890-1900; 'Stationary Engines,' 1885; 'Friction and Loss in Machinery and Mill Work,' 1885-93; 'Heat as a Form of Energy,' 1890; of Robert Fulton,' 1891; and numerous fic papers. Consult Durand, W. R., 'Henry Thurston,' (Washington 1904). IUSNELDA, wife of Arminius (q.v.), of the Cherusci, a German tribe which the Romans from the Elbe and the in 9 A.D. 14 A.D. the Roman legions again penetrated the German interior, and Thusnelda was taken captive to Rome by the Roman conqueror, Germanicus Cæsar (q.v.).

THWAITES, thi-wats, Reuben Gold, American historian and editor. b. Dorchester, Mass., 15 May 1853; d. 1913. He was educated at the high school of his native town and in 1874-75 took a postgraduate course at Yale. From 1876 to 1886 he was managing editor of the Wisconsin State Journal. He published 'Down Historic Waterways' (1888; rev. ed. 1902) 'The Story of Wisconsin' (1890); 'The Colonies, 1492-1750' (1891); 'Afloat on the Ohio' (1897); 'Daniel Boone' (1902); 'Father Marquette' (1902); 'Brief History of Rocky Mountain Exploration' (1904); 'France in America' (1905); 'School History of the United States' (1912). He also edited The Jesuit Relations (73 vols. 1896-1901); 'Original Journals of Lewis and Clark' (7 vols., 1905); 'Early Western Travels, 1748-1846' (32 vols., 1904-07), and other works. Consult Turner, F. J., 'Reuben Gold Thwaites' (Madison, Wis., 1914).

THWING, Charles Franklin, American college president. b. New Sharon, Me., 9 Nov. 1855. He was graduated at Harvard in 1876, and at Andover Theological Seminary in 1879; received the honorary degree of S.T.D., from Chicago Theological Seminary in 1889 L.L.D., from Marietta College in 1894, from Illinois College in 1894, from Waynesburg College in 1901, from Washington and Jefferson College in 1902, and from Kenyon College in 1910; was ordained Congregational minister in 1879; was pasteur of North Avenue Congregational Church in Cambridge, Mass., 1879-86, of Plymouth Church in Minneapolis, 1886-90, and president of Western Reserve University and Adelbert College since 1890. He is associate editor of Bibliotheca Sacra since 1884, secretary of the Carnegie Foundation for the Advancement of Teaching, and president of the Intercollegiate Peace Association. President Thwing is the author of American Colleges: Their Students and Work (1878); 'The Reading of Books' (1881); 'The Working Church' (1884); 'Within College Walls' (1894); 'The College Woman' (1894); 'The American College in American Life' (1900); 'College Administration' (1900); 'The Best Life' (1900); 'The Choice of a College' (1901); 'God in His World' (1902); 'The Youth's Dream of Life' (1902); 'If I were a College Student' (1902); 'A Liberal Education and a Liberal Faith' (1903); 'College Training and the Business Man' (1906); 'Higher Education in America, A History' (1906); 'Education in the Far East' (1909); 'History of Education in the United States since the Civil War' (1910); 'Universities of the World' (1911); 'Letters from a Father to His Son entering College' (1912); 'Letters from a Family to His Daughter entering College' (1913); 'The Co-ordinate System in the Higher Education' (1913); 'The Family: An Historical and Social Study' (1886 in collaboration with Carrie Butler Thwing, revised 1913); 'Education according to Some Modern Masters' (1916) and contributions to magazines.

THYESTES, thi-és-tez. See Atreus.
THYLACINE, an Anglization of the generic term Thylacinus given to the predatory marsupial called Tasmanian or zebra wolf, and described under Dasyure (q.v.).

THYME, one of the species of the labiate genus Thymus, small, shrubby, perennial herbs of the Old World, cultivated on account of their aromatic foliage as flavoring herbs, or for ornament. T. vulgaris, an erect, or somewhat decumbent plant, from one to two feet high, has sessile linear-lanceolate leaves with revolute margins. The pale-lilac flowers are small, and in interrupted spikes at the ends of the branches. Thyme has a very strong and pungent odor, and was formerly employed for seasoning. It is a favorite food of bees, and that of the Grecian hills produced the famous honey of Mount Hymettus. Another thyme, sometimes grown as a culinary herb, but more often to cover rock-work and waste places, is the creeping thyme or mother-of-thyme (T. serpyllum). Its internodes are short, so that the plant is very low, and in dense, broad tufts. One of its varieties (citriodorus), is the lemon-scented thyme. Oil of thyme is distilled from these plants, especially in France, where they are very abundant, and may be used in perfumery. The oil of the oil of origanum, and is of utility in veterinary practice. Thymol is a solid, acrid steartopene obtained from this oil, and is used, chiefly externally in alcoholic solution, for a stimulant and powerful antiseptic in the treatment of wounds and sores. Other labiates called thyme, from their aroma, are Calamintha anisata, and C. nepeta, the basil thyme, and C. clino-podium, the horse-thyme. The cat-thyme is the herb-mastic, or Teucrium marum, a powerful sterntatory, useful for its scent. Virginian thyme is Koelia virginiana.

THYME OIL, a volatile oil obtained by distilling the leaves and flowering tops of Thymus vulgaris, or garden thyme, with water. Colorless when pure, sparingly soluble in water, easily so in alcohol. It contains two hydrocarbons pinene, C_{10}H_{16}, and cymene, C_{10}H_{14}, as well as a phenol-like body thymol. Used in lotions and dressings as a stimulant and antiseptic.

THYMOL, in chemistry, C_{6}H_{5}O, a colorless crystalline compound obtained from the oil of thyme, horse mint, etc. Often called thyme camphor. Its chemical nature is analogous to that of phenol, or carbothic acid, though it has but little of the caustic properties of that body. It crystallizes in plates, is almost insoluble in water, soluble in alcohol, melts at 44° C., and is very easily attacked by many chemical agents. It has a very strong odor and is used as an antiseptic and disinfectant. Indine and caustic potash convert it into di-iodo-thymol, which is the well-known antiseptic aristol.

THYMEUS GLAND, one of the ductless glands, existing as a temporary organ, developed to its full size about the end of the second year of life and decreasing in size after that period. At puberty it almost or wholly disappears. At its full development it appears to consist of two lobes or halves, situated in the middle line, and placed partly in the neck, extending from the cartilage of the fourth rib upward as high as the inferior edge or border of the thyroid gland (q.v.). It is covered in front by the strap, and by the sternothyroid and sternothyroid muscles. It rests upon the pericardium or heart sac, and lies on the neck on the front and sides of the trachea or windpipe. This gland is of a lobulated appearance, and is of soft consistence. Its weight at birth is about half an ounce. Its microscopic structure exhibits a composition of lobules, each lobule being formed of regularly disposed masses of what is termed lymphoid tissue, consisting of a meshwork of exceedingly delicate connective tissue, the meshes being crowded with round cells identical with the white corpuscles of the blood and lymph corpuscles. The functions of the gland are still undetermined. It is placed in the same category as the thyroid gland and spleen; and the most probable theory as to its use is that which assigns to it the work of elaborating the elements of the blood, especially in the earlier years of life. It is generally believed to exert a strong influence on growth and development. It is employed in organotherapy (q.v.). The well-known 'sweatbread' is the thymus gland of a calf or lamb.

THYRIDOPTERYX, a genus of foliage-destroying insects. See BAGWORM.

THYROID GLAND, a structure having no outlet or duct, and classified with the spleen, thymus gland, and suprarenal capsules under the general name of ductless glands. In man the thyroid gland is situated at the upper part of the trachea or windpipe and consists of two halves or lobes, placed one on each side of the windpipe, and united by a narrow bridge of substance—the isthmus of the gland. It is covered in front by the muscles of the neck and its sides lie in contact with the common carotid artery. Its under surfaces embrace the windpipe and larynx. This gland is of a reddish color. It is larger in women than in men, and weighs, on an average, about one and one-half ounces. It may become enormously enlarged, as in goitre. Its structure consists of numerous small shut sacs, surrounded by a network of capillary blood vessels, or shut sac is lined internally by a single layer of columnar cells, and is filled with a viscid mucoid substance. The blood-vessels of the gland are derived from the superior and inferior thyroid arteries and its nerves come from the pneumogastric and sympathetic trunks. The use of this gland is not quite clear, but is generally held to be the production of a secretion which has a great influence on alimentation. Its business is connected with the maintenance of a proper quality of blood, either by the removal of certain effete substances from the blood, or by the addition of certain elements to it. Its complete extirpation or atrophy is attended with disease. The thyroid gland of the sheep is used in the treatment of myxedema, the complication resulting from the loss of function of the gland.

THYROID GLAND, Diseases of. Several varieties of enlargement have been noticed in the thyroid and are generally grouped under the general term goitre (q.v.). Myxedema is the present name given to the condition resulting from the loss of function either because of atrophy or of the excision of the organ. The thyroid gland of the
THYRSe—TIBER

is used in the preparation of an extract is efficacious in the relief of this condition.

See Creditism; Secretions, Internal;

York, thers, a form of inflorescence ting of a compact panicle in which the e branches are the longest, giving the an ovate shape. The primary pedicels entrical, and the secondary centrifugal.

YSANURA, an order of neuropteroid s. See Brisiletails.

AHUANACO, té-a-wa-nâ-kô, Bolivia, tins of a prehistoric city, near the south of Lake Titicaca, in lat. 16° 42′ S., long. 7° W., about 40 miles west of La Paz city. ruins stand on an eminence 12,930 feet sea-level, which, from the water marks d it, seems to have been formerly an in Lake Titicaca. The level of the lake ver, is now 135 feet lower, and its shores miles distant. This fact, in conjunction others, warrants the belief that these re- antedate any other known in America; indicate a different and higher order of an was found to exist at the time of the sh conquest, in any other part of that ent. The ancient Peruviens had the st traditions concerning them, believing he structures of which they are the re- were raised in remote ages, by giants, in de night. The chroniclers of the Spanis est have described them, and their ac- s do not differ materially from those of medieval. They are in a state of ex- dilapidation. Some of the structures to have been built on a pyramidal plan, have covered several acres; but the most kable features still remaining are mono- doorways, pillars and statues of stone, ately sculptured in a style wholly dif- from any other remains of art yet in America. One of these doorways is at 100 feet, with an opening yet four inches by three feet two inches, hewn cut from a single stone. Its east has a cornice in the centre of which is a figure of strange form, crowned with interspersed with serpents with crested.

On each side of this figure are rows of square compartments, filled with n and other figures, of apparently sym- design. The statues are broken, so that iticult to state their original dimensions; ise may be inferred from the size of the of one, which is four feet in length and portionate width. The whole neighborhood to be swarmed with vast blocks of stone clab- y wrought, some of which measure three n length by 18 feet in width, and six in thickness. Some of these stones have found to weigh as much as 400 tons and transported many miles. No mortar was in the masonry; stones grooved and ed were held together with clamps and n pins. Dressing and carving of stones lone with this, whilst the stones for the of the islands of Lake Titicaca are other nents, of great extent, but of true Peru- type, apparently the remains of temples yed on the arrival of the Spaniards.

At the island of Coati, however, have features in common with the ruins of Tiabuanaco, and probably belong to the same epoch, and are to be ascribed to the same unknown and mysterious people who preceded the Peruviens, as the Tulluataecs or Toltecs did the Aztecs. Not far distant from the ancient site stands the present town of the same name, largely built from stones taken from the old ruins. Consult Stübel and Uhle, 'Die Ruinenstätte von Tiabuanaco' (Breslau 1892).

TIARA, the crown of the Pope, a cylindrical diadem with three crowns and a pointed top surmounted by a mound and a cross of gold, which the Pope wears as a symbol of sovereignit. It is placed upon the Pope's head at his coronation by the second cardinal deacon, with the words, "Receive the tiara adorned with three crowns, and know that thou art Father of princes and kings, Ruler of the world and Vicar of our Saviour, Jesus Christ." The tiara is not worn upon purely spiritual occasions, the Pope then wearing the mitre of a bishop. The first crown is said to have been added to the mitre by Nicholas I (858-867) as a symbol of unifying the prince of Christ with it; the second crown was added by Boniface VIII (1294-1303); and the third, first appears on the monument of Benedict XII (1334-42).

TIBALDI, té-bál’dé, Pellegrino, Italian painter and architect; b. Bologna, 1527; d. Milan, 1598. In 1547 he commenced his profound study of Michelangelo at Rome and painted for Cardinal Foggia, in his palace at Bologna, the 'History of Ulysses.' When Caracci saw these pictures, in which the style of Michelangelo appeared in a softened and refined form he pronounced Tibaldi il Michelangelo Riformato—an improved version of Michelangelo. He also decorated the chapel of Saint James for the Augustinians. Among his architectural works are the palace of Cardinal Borromeo at Pavia (1562); the Church of Saint Pidelis at Milan, and the new façade of the cathedral in that city. He likewise furnished Philip II who had summoned him to Spain in 1586, with the plan for the Escorial, and painted the ceiling of the library in that palace. Consult Gurli, 'Der Barockstil in Italien' (Stuttgart 1887); Zanotti, 'La pitture di Pellegrino Tibaldi' (Venice 1756).

TIBER, tî'ber (Italian, Tevere), Italy, a river rising in the Appennines of Tuscany, in central Italy, about 11 miles north of Pieve San Stefano, some 4,000 feet above sea-level. It is one of the largest and most celebrated rivers of the country, has a winding course, flows 244 miles and empties into the Mediterranean, passing many noted cities on its way to the sea, which enters by two branches—the Fiumicino and Fiumara. It is navigable for small craft as far as the mouth of the Nera, a distance of about 90 miles, but for small steamers only as far as Rome where it attains a breadth of about 250 feet. Its principal tributaries are the Nera and Paglia, which also receive their own affluents. The upper course is precipitous and the torrential streams which supply its water are the cause of its frequent overflow and consequent inundations. The chief cities on its route are Perugia, Orvieto, Ostia and Rome. The swift current carries along a vast amount of sediment from which condition arose the name 'yellow Tiber,' fluvius.

TIBERIAS, ti-bè'ri-as, Sea of. See GALLE-LEE, Sea of.

TIBERIUS, ti-bè'ri-us (TIBERIUS CLAUDIUS NERO CESAR), Roman emperor, son of Tiberius Claudius Nero, and Livia Drusilla, who was afterward married to the Emperor Augustus: b. 16 Nov. 42 B.C.; d. Misenum, 31 March 37 A.D. Brought up in the imperial household, Tiberius had by his conquests in Germany and Gaul gained the confidence of Augustus, by whom he was made a Roman consul. In 11 A.D. he was compelled, in order to retain the favor of Augustus, to divorce his wife, Vipsania Agrippina, and to marry Julia, the emperor's daughter, and in 14 A.D., shortly before the death of the emperor, he was formally adopted as his heir. According to Tacitus, the reign of Tiberius, although marked by cruelty and infamy which could have been possible to only the most profligate and dissolute of men, was rendered less tyrannous than might have been expected, by the subsistence of justice in matters of taxation and at times by a certain respect for the privileges of the Senate, and the rights of the common people, a course to be commended in a period of absolute despotism. The atrocious disregard of human life and liberty wherever his own private interests were at stake could, however, scarcely have been equalled. It was in this reign that the crime of 'lesa majestas' was established. Consult Jerome, T. S., 'The Tetrarchy of Tiberius' (in Classical Philology, Vol. VII, Chicago 1912); Mommsen, 'The Roman Provinces from Augustus to Diocletian' (1886); Schiller, H., 'Geschichte der römischen Kaiserzeit' (Gotha 1883); Tawney, J. C., 'Tiberius the Tyrant' (New York 1902).

TIBERIUS CONSTANTINE (TIBERIUS II), emperor of Byzantium: b. Thrace; d. Byzantium, 582 A.D. He was brought up by the Emperor Justin II whom he succeeded on the throne of the Eastern Empire in 578. It was during his reign that the great influx of Huns and Slavs in the north and east, and that of the Lombards in the west, began seriously to threaten the Roman empire.

TIBET, ti'bèt or ti'bät, or THIBET, a country of central Asia, under Chinese suzerainty, lying between latitude 28° and 36° N., and between long. 79° and 103° E. It is bounded on the north by East (Chinese) Turkestan, on the east by China proper, on the south by British India, Bhutan and Nepal and on the west by the Indian state of Kashmir. The area is estimated at about 465,200 square miles. Tibet forms the most extensive and loftiest mountain region in the world. It is structurally a complex of folded mountains whose intervening valleys have been filled up with detritus, converting them into plains whose general level lies from 10,000 to 17,000 feet above the sea, while the mountains tower almost as high again above the level of the adjacent plain. It is traversed along the southwestern boundary and the Karakoram with its outliers, by a range of the plateau of the country. These ranges have numerous peaks between 20,000 and 29,000 feet in height. On the northern boundary run the Kuen-Lun Range, sending numerous spurs and offsets into the plateau. The eastern half of Tibet is traversed by a system of more or less parallel ranges with a southeast trend. The enclosed plains in western and northern Tibet form closed drainage basins, very poorly watered, and containing salt lakes. The eastern longitudinal valleys are drained by the headwaters of the Yang-tse-kiang. Hoang-ho and Salwa rivers and in the south, along the northern base of the Himalayas, run the Indus to the west and the Brahmaputra to the east. The climate is excessively dry, with great and sudden fluctuations in temperature, and severe cold and biting north winds in winter. The vegetation is scanty and characteristic of desert and alpine regions. There are green meadows only along the streams and in the eastern mountains are forests of birch, poplar and coniferous trees. Wild animals are very numerous along the watered regions and antelopes, yak oxen and wild asses are characteristic of the range.

The inhabitants, who number about 2,000,000, are of a semi-civilized Mongoloid race somewhat akin to the Burmese. In the north they are nomadic, but in the south they are settled in substantial houses of stone or sun-dried brick, and cultivate the soil along the river valleys. The industries are not important, but there is a considerable trade with China, and wool, furs, musk, gold, borax and salt are exported. The language of the people is similar to the Chinese, but has taken on polysyllabic characters. A considerable amount of literature, mainly religious, has been accumulated, and printing has been practised for centuries. The prevailing religion is Buddhism, of the form known as Lamaism. The priesthood is exceedingly numerous and the government is a theocracy. At its head is the Grand Lama or Dalai Lama, who resides at Lhasa (q.v.), the capital, and who claims to be the head of the Buddhist world. This priest government has enforced a strict exclusion of non-Buddhist foreigners, particularly from Tibet. A Chinese resident was permanently stationed at Lhasa. Russian diplomatic influence seems to have gained a foothold in Tibet when, in 1905, the British Indian government took the occasion of the non-compliance of the Tibetans with the terms of the treaties of 1890 and 1893, governing frontier trade relations, to send a military expedition across the boundary. The avowed purpose was to negotiate with the Tibetan government, but the latter declined to negotiate and the British column pushed on toward Lhasa. On 31 March 1904 at Gara where the Tibetans had built a wall across the highway to oppose the advance, 1,500 of their soldiers were flanked and effectively enclosed in a circle. An attempt to disperse them, and then strike them rearward without meeting by the Tibetan general with a Sikh by a pistol shot which was the signal for a general onslaught by the Tibetans. A terrible magazine rifle fire, and the bringing into action of a mountain battery resulted in the slaughter of their soldiers, the British subsequently occupying their country and the Karo-la, and at Gyantse jongs or caves where for a time they were besieged by their
sands of Tibetans. The expedition eventually reached Lhasa; after long negotiations, ended only by threat of force, without any result. Colonel Younghusband concluded a treaty which was afterward censured by the Indian government as in excess of his instruction. Protest from the Chinese government led to the Anglo-Chinese convention of 1906, whereby England and China recognized the independence of Tibet, and secured China, as Suzeiian power of Tibet, paid an indemnity of 2,500,000 rupees. The agreement entered into between the two countries at this time was further strengthened by the conclusion of trade regulations between India and Tibet (1908). At the time of the Chinese Revolution in 1911 the Tibetans expelled the Chinese garrison, and an expedition subsequently sent out from Szechuan and Yunnan was withdrawn on the Great Britain's disapproval. In 1912 the British government outlined its attitude toward the Tibetan question, in accordance with the provisions of the treaty of 1906, objecting to Chinese assertion of sovereignty on Tibet. A tripartite conference was opened at Simla in 1913, but was dissolved without reaching any satisfactory agreement. Since that time Great Britain has declined to reopen negotiations. Consult Coales, O., *Eastern Tibet* (in *Geographical Journal*, April 1919); Gerard, F., *Tibet: The Country and its Inhabitants* (tr. from French, London 1904); London, P., *Lhasa: The Tibetan Expedition, 1903-04* (2d ed, London 1906); Lansdell, H., *Chinese Central Asia* (2 vols, London 1893); Rijnhart, S. C., *With the Tibetans in Tent and Temple* (London 1901); Younghusband, F. E., *India and Tibet* (London 1910).

**TIBET DOG** or **TIBET MASTIFF**, a breed of dogs about the size of a Newfoundland dog, but with a head resembling that of the mastiff, and having the fleshy and pendent ears. The color is usually deep black, with a bright brown spot over each eye; the hair is long and the tail bushy and well curved. This variety is extremely savage, and has been known from classic times, when it was employed by the Romans, especially under the emperors, in the games of the circus.

**TIBIA.** See ANATOMY; OSTEOLOGY, HUMAN.

**TIBULLUS, Albius, Roman poet:** b. about 54; d. about 19 B.C. He belonged to the equestrian order, and was on intimate terms with Messala (q.v.), whom in 31 he accompanied in a campaign in Aquitanian Gaul. He set out with him thence to the East also, but was forced through ill-health to land and he left behind at Corecyra. Henceforth he lived on his estate, between Tibur and Franeaster. Horace was warmly attached to him and addresses to him one of his epistles, in which he credits his friend with the possession of a tender heart, beauty, wealth, good health and good taste in everything. There are eleven books of elegies under his name, but the third and a part of the fourth are spurious. These poems are among the most perfect of their kind which have come down to us from classical antiquity. The elegies are characterized by graceful simplicity and tender feeling, and are free from the insipid prolixity into which Ovid frequently falls. The chief editors are those of Bährnens (Leipzig 1878); and Hiller (ib. 1885); Lachmann (1829); Möllner (ib. 1885); Postgate (1896). There is a translation by Duff (New York 1872). Consult Duff, J. W., *A Literary History of Rome* (New York 1909); Sellar, W. Y., *Horace and the Elegiac Poets* (Oxford 1892); Teuffel, W. S., *Geschichte der klassischen Pomischen Literatur* (Vol. II, 3d ed, Munich 1911).

**TIBURON, té-bóo-rón,** Mexico, an island in the Gulf of California, situated in the upper part of the gulf, 230 miles from the mouth of the Colorado River, and separated from the coast of Sonora by a channel from two to five miles wide. It is 30 miles long and from 10 to 20 miles wide, and covered with grass and desert vegetation. It is inhabited by the Cenis or Seris Indians, who have been left almost wholly to themselves by the Mexican government, and still live in a primitive state of nature. They are warlike and feared by the neighboring tribes on the mainland; use poisoned arrows, and are said to practise cannibalism.

**TIC-DOULOUREUX, tíc-dool-oó-ré.** See FACIAL NEURALGIA; NEURALGIA.

**TICAO, tíc-ków,** Philippines, one of the islands of Masbate province, lying northeast of Masbate Island, and southwest of Sorsogon, Luzon, area 140 square miles; with dependent islands 149 square miles. It is long and narrow, extending 23 miles from northwest to southeast, and narrowing gradually from a width of eight miles in the north to the southern point Cape San Rafael; the surface is rugged with many small mountain groups, and single peaks; the highest elevation in the northwest is 1,525 feet. The west coast is steep and rugged; the east coast indented by several small bays. Hemp, rice, sugarcane, cotton and chocolate are raised in small quantities; and gold is obtained from the river sands. The more important occupations of the people are stock-raising, weaving, fishing and hunting. Pop. 10,183.

**TICHBORNE (tích-bórn) TRIAL,** a famous English lawsuit in which was contested the validity of the claim of one Thomas Castro that he was Roger Charles Tichborne, heir of the Tichborne estates. Roger Charles, the eldest son of Sir Alfred Joseph Tichborne, died at sea in 1854 and upon the death of the second son, in 1866, the youngest was acknowledged heir. But Lady Tichborne said that her eldest son was really dead, and so she advertised for him. Castro, a butcher from Wagga Wagga, Australia, also known as Arthur Orton, of Wapping, came forward and claimed to be Roger, the rightful heir. He was accepted by Lady Tichborne, who, however, died before his suit to recover the estate began. The trial lasted 103 days and was ended by Castro being non-suited, 6 March 1872. He was arrested and charged with perjury and a trial of 188 days followed, a verdict of guilty being found 28 Feb. 1874. Castro was sentenced to 14 years' imprisonment with hard labor. He was discharged on a ticket-of-leave in 1884, confessed his imposture in 1895, and died in poverty and oblivion in 1898. The second trial, which was the longest in the history of the English courts, cost £55,315. Consult ʻThe Tichborne Romanceʻ (Manchester 1871).
TICINO, tê-chê'no (German Tessin), Switzerland, a canton situated on the southern frontier of the republic, and bounded on the east, south and west by Italy. Area, 1,086 square miles. The Saint Gotthard group of the Lepontine Alps forms the northern and the Adige Alps the eastern boundary. Ramifications of these fill the canton, but are cut by the valley of the Ticino River. The latter drains practically the whole canton, and empties into Lake Maggiore, which extends some distance. The town situated on the basin of this lake thus belongs to the basin of the Po. The upper mountain regions are rocky, but the southern part of the canton is very fertile, producing grain, fruits and grapes. Large numbers of goats are raised in the mountains. The principal mining industries are granite and marble quarrying. Commerce and manufactures are unimportant, although there is a considerable tourist traffic over the Saint Gotthard Railroad, which traverses the canton. The capital is Bellinzona (q.v.). In 1803 the canton of Ticino was formed by the union of the cantons of Bellinzona and Lugano, formerly part of the Helvetic Republic, and it was received as a full member of the Swiss Confederation. Pop. 136,556. See SWITZERLAND.

TICINO (German and French, Tesson), river of Switzerland and northern Italy, rising on Mount Saint Gondard, and flowing in a general southeast direction, first as a rapid torrent through the canton of Ticino, then through Lake Maggiore, and finally as a clear, navigable stream on the boundary between Piedmont and Lombardy. After passing Pavia it joins the Po. Length, exclusive of Lake Maggiore, 188 miles.

TICKELL, Thomas, English poet: b. Bridgwater, Somerset, 1686; d. Bath, Somerset, 23 April 1740. He was educated at Queen's College, Oxford, a fellowship of which he held 1709-20. He was the friend of Addison, who introduced him both into the world of letters and public life, and on becoming in 1717 secretary of state made Tickell under-secretary. He held the office of secretary to the Lords Justices of Ireland from about 1724 till his death, and published the first book of the 'Tladi, about the time of the appearance of the first part of Pope's 'Homer.' Addison declared that Tickell's version was the best, while Pope professed to believe it the work of Addison himself and wrote in reply the famous satire on Atticus. But without doubt Tickell made his own translation, which Addison corrected. Tickell's longest poem is 'Kenmington Gardens' (1722); his most popular, the ballad of 'Colin and Lucy'; while his finest is the elegy to Addison prefixed to his edition of Addison's works (1721). Consult Johnson, Samuel, 'Lives of the Poets' (Oxford 1915).

TICKET-OF-LIFE, a written license granted by the English government, whereby a penal convict was given his liberty for good behavior before the expiration of his sentence. It existed in the period of the Hanoverian colonial system, it was not adopted until 1740, when the colonies refused to receive more convicts. Certain restrictions were imposed on the recipient, requiring that he report to the police at stated intervals until his term expired, that he should not make change of address without notifying the police, etc. The system was much abused and it was said that in 1856, 2,666 convicts were thus liberated. The number of crimes committed increased and the necessity for more stringent measures led to the adoption of the convict system, under which only those convicts, sentenced for terms of more than two years and whose marks for good behavior and industry showed that they were entitled to it, were granted the license. The effectiveness of such a system is greatly increased by the cooperation of many charitable organizations which use every possible means to re-establish the ex-convict and to enable him to lead an honest, industrious life.

TICKNOR, Francis Orrey, American physician and poet: b. Baldwin county, Ga., 1822; d. near Columbus, Ga., 1874. He studied medicine and engaged in practice near Columbus. His verse, particularly that concerning the Civil War, was highly popular throughout the South. Several of his poems are in Steeman's 'Anthology,' and all of his verses were collected and published with a biographical sketch by P. H. Hayne, 'Virginians of the Valley, and Other Poems' (1879).

TICKNOR, George, American historian: b. Boston, 1 Aug. 1791; d. there, 26 Jan. 1871. He was admitted to the bar in 1813, but never adopted the law as an active profession. He lived in Europe 1815-18 for the purpose of pursuing his studies, and on his return was appointed to the Smith professorship of modern languages and literature in Harvard. In 1825 he resigned his professorship, and for the next three years traveled in Europe. On his return he devoted himself to writing a 'History of Spanish Literature,' published in 1849, in three volumes, a corrected and enlarged appearance in 1853. Its value was at once recognized by scholars and it was translated into Spanish, French and German. He produced in 1863 a 'Memoir of Prescott,' the historian. He also wrote 'Outline of the Principal Events in the Life of General Lafayette,' 'Remarks on Changes lately Proposed or Adopted in Harvard University' (1825); 'Remarks on the Life and Writings of Daniel Webster' (1831); 'Lecture on the Best Methods of Teaching the Living Languages' (1832). Consult Hillard, George S., and Ticknor, Mrs. Anna and Ticknor, Anna Eliot, 'Life, Letters and Journals of George Ticknor' (2 vols., 1870), critical ed., by Ferris Greenlet (1909).

TICKS AND MITES, small arthropods usually considered to be an order (Acracida) of the class Arachnida (q.v.). They have the common features of the body the mouth parts located on the head and thorax more or less united to form a cephalothorax, but the latter is continuous with the abdomen, often without the slightest indication of the line of union, and the segmentation is except in a few respects indistinct or unsegmented. The mouth-parts usually consists of piercing and sucking proboscis composed of the chelicerae and pedipalpi, the latter being made up in part of a jointed, usually tactile palpus, while the chelicerae may be subform and su-

5 Water Mite (Atax spinipes)  
6 Pigeon Tick (Argas reflexus)  
7 Itch Mite (Sarcoptes hominis)  
8 Tick (Ixodes ricinus)
or two-jointed and clawed or chelate. The mature forms or imagos have pairs of walking legs of from five to eight terminated by variously arranged claws, or sessile suckers or pads; but the legs are variably modified, reduced to mere tarsus or two pairs or disappear altogether in parasitic forms. Respiration is by means of simple or branched tracheae, by one or three pairs of stigmata, or by a pair opening at the base of the proboscis. In the absence of all the special respiratory organs, may be purely integumental. The alimentary canal is commonly a sac which may be forked or much divided. In most cases there is no blood-sucking system. The tracheae are separated, the ducts open on the base of the abdomen and fertilization is accomplished through them. A few are parthenogenetic and limphorous is frequent. They are oviviporous or viviparous. The females differ greatly from the imagos in appearance and habits and almost alive three pairs of legs. After a few days, they form nymphs or pupae, which may be very different, and after a short metamorphosis into the mature form.

Ticks and mites are found in all parts of the world under every variety of environment. They are parasitic either temporarily or permanently, and on both animals and plants, and may be found in nests, etc., nests, lice, and under the bark of trees, many are either in fresh water or the sea, and some marine forms descend to great depths. While most of the members of this are direct relation to human affairs, affect our interests in important and 1 ways. Some, like the itch-mites, are of stinging diseases of man and animals like the cattle ticks and are the bearers of parasites, some are sericultural to our crops or to manufactured products, etc.; and many are benefactors of harmful insects and their life to their great powers of reproduction and their tenacity of life, the harmful are difficult to combat, preparations of lime or powerful insecticides are used against the colonies being the most effective. The number of known species amounts to thousands, although their mites have been little studied out of Europe. They vary in size from the pic mites to the large cattle ticks in length. Differing greatly not only in appearance but also in structure, rida are divided by systematists into families and subfamilies, of which representatives may be mentioned. Tribidae is an extensive family of 20 and 200 to 300 species of free-living with hard skins and robust bodies and three pairs of stalked stigmata and tracheae. They are mostly vegetable never parasitic and with the exception of a few aquatic forms lives in damp earth under leaves, bark, etc.

The Gamasidae are somewhat similar, with rounded bodies and a hard skin, but have only a single pair of stigmata at the base of the second pair of legs. The blood system is well developed. They often swarm on the underside of rove-beetles, carrion-beetles and other insects and some are parasitic on bats and birds; 35 genera and perhaps 200 species are already known.

The Ixodidae are the ticks, large blood-sucking species, with ovoid bodies and leathery skin capable of great extension. They are temporary parasites of vertebrates, chiefly of birds and mammals. As a rule the eggs are deposited in the ground; the newly hatched larva have three pairs of long clawed legs with which they attach themselves to a host, insert the beak and suck the fluids. When ready to slough they may drop off, seek concealment until the skin is changed, when the same maneuver is repeated. After passing through nymphal stage, the imagos live among herbage and shrubbery and upon opportunity again attach themselves, but usually in pairs, to some warm-blooded host, inserting the strong beak and drawing blood while reproduction takes place. The fertilized female becomes greatly distended, often to a spherical form, drops off and deposits her eggs, often to the number of 20,000 to 30,000. The large cattle-tick (Boophilus bovis) of the western ranges, now known to be the intermediate host of the parasite of Texas fever and a great scourge to cattle and other animals, is an example. Others are the wood-tick (Ixodes undecimtata), so common in New England, and certain European species, one a parasite of poultry and introduced into the United States, as the related dove-tick also has been.

The Hydrachnidae are the attractive and familiar water-mites, another large group of 40 genera and about 500 species. The adults, remarkable for their sexual dimorphism and brilliant colors, suck the juices of small crustaceans while the young are parasitic on aquatic insects and mussels. The brilliant scarlet eggs of some species are frequently found attached to aquatic plants and stones in a mass of jelly. A related family containing mostly marine predators is the Halacaridae. An allied family is the Trombidiidae, including the scarlet mites and the red spiders so well known to horticulturists. A very common one is Tetranychus telarius, which spins a web on the under side of leaves and is very destructive to plants during hot dry weather. Others cause great damage to orange and lemon groves. The young are parasitic on insects.

The disgusting itch-mites form a family (Sarcoptidae) of short, rounded forms which lack eyes, tracheae and stigmata altogether. They are microscopic and burrow in the skin of various animals, causing the diseases known as itch and mange, which are very difficult to eradicate but usually yield to persistent applications of sulphur washes. No less than 60 genera and 550 species parasitic on mammals, birds and insects have been described. (See itch.) Sheep-scarb and mange in various domestic animals are caused by related mites of the genera Psoroptic and Symbiotes. They all
TICONDEROGA — TICUNA

have the feet wonderfully provided with adhesive organs in the form of hooks, bristles and sucking cups. Closely allied are the Typhlophidae, comprising perhaps 30 species of minute forms with biting jaws. They are chiefly terrestrial, and the females lay their eggs in the female reproductive capacity and the enormous numbers in which they occur in slowly decomposing vegetable substances, etc. Here belong the cheese-mites (Typhlopsus soro and T. longipilus) which are cultivated and sold in certain cheeses in order to give them an appearance of maturity and an acid flavor. Many similar species infest stored grain, dried fruits, etc., and some, like Aleurodiscus and Rhyzoglyphus, destroy living roots, bulbs and grains. Another one abounds in unrefined sugars.

Two strictly parasitic families in which the body has become elongated and worm-like and otherwise degenerate are Demodice and Ero Ephidae. The former live in the hair follicles and sebaceous glands of man and domesticated animals. *Demodex follicularum* sometimes causes the *blackheads* which appear about the human nose; similar species infest the pig, dog, sheep, ox and other animals. That of the ox sometimes perforates the skin, and it has little value for food, because the body forms the legs are very small and degenerated and one pair may be lost. The second family is that of the galls which have but two pairs of legs, the posterior being sometimes represented by bristles. They form galls and the buds and leaves of plants whose juices they suck. Most of the species are confined to a particular species of plant, so that the 255 which have been described are probably but a small representation of those actually in existence. Some are parasitic in the galls made by others, recalling the inquilines among the gall flies.

**TICONDEROGA,** ti-kon-de-ro'ga, N. Y., village, Essex County, on the stream which is the outlet of Lake George, and on the Delaware and Hudson and the Hudson Valley railroad, about 95 miles north by east of Albany, and a short distance from Lake Champlain and George. In the vicinity are rich deposits of crystalline granite, the chief source of the supply in the United States. The granite has been worked for over 100 years. The good water power is utilized for some extent for manufacturing. The chief manufactures are lumber products, wood pulp, paper and slate products.

Ticonderoga and vicinity become the early settlement of Vermont and is now New York. In 1755 a fort was built here by the French. This called it Fort Carli-

on, account on the Caroling or churning of the waters. The value of the site, near the head of Lake Champlain and at the entrance to Lake George, which, with a short portage, formed a water route to the Hudson, was recognized by both the French and English. Two years after the erection of Fort Carillon it was garrisoned by a force of 9,000 men under Montcalm. Wishing to extend the power secured by so advantageous a position, Montcalm attacked and captured Fort William Henry on Lake George. In July the following year General Abercrombie attempted to capture Fort Carillon, and although he had a force of 15,000, he was unsuccessful; his loss was about 2,300. In 1759 another and successful effort was made to wrest the fort from the French; General Amherst with a force of 12,000 captured both Carillon and Crown Point. After the beginning of the Revolutionary War, the whole region bordering on Lake Champlain, Lake George and the Hudson river became a battle ground. On 10 May 1775, a small force of Americans, less than 100 in number and known as "Green Mountain Boys," under Ethan Allen (q.v.), demanded the British commander surrender in the name of the Green Mountain and the Continental Congress; and thus, despite the fact that Allen held no commission and also that the Continental Congress had not yet convened, captured the fort, then called Ticonderoga. Burgoyne's plan of campaign included regaining this fort, and on 30 June 1777 he endeavored to capture the Americans, but failed. On 5 July of the same year, he made another attempt and this time succeeded. Later other engagements took place here and in the vicinity, but the English kept possession until after the surrender of Burgoyne. In 1780 as English force occupied the fort for a short time. At the close of the wars with England the fort ceased to be of importance, and as it was not occupied it soon became a ruin. Near the village stands a part of the gray stone walls of the old fort. Many tourists visit the village each year, and it has some note as a summer resort. Pop. 2,918.

**TICODUNOLOUS.**

**TICPOLONGA,** the name in Ceylon of Russell's viper (Daboa russelli) common in the south of India, Ceylon and Burma. See Russell's Viper.

**TICS,** spasmodic contractions of muscles, especially those which occur in the muscles of the face. Such affections are characterized by painful muscular twitching. The term is, referring to facial spasm, is especially applied to tic-douloureux. See FACIAL NEURALGIA.

**TICUNA,** te-koo'nà, or TUCUNA, te-koo'nà, a tribe of aboriginal Indians found in the forests of Brazil and Peru, around the confluence of the Parana and the Amazon. They are of slender but good physique, have dark skins, and live in a state of nature, their sole adornments being feather armlets and monkey teeth necklets. They live by fishing and hunting, and are respected for their honesty and straightforward dealings. Their birth, death and other ceremonies and customs are interesting. Early in the 18th cen-

DE-MILL, a water-mill so constructed utilize the action of the tide. This is accomplished by one of two methods. 1st consists of shutting off the water in a sill at flood tide, its escape through a giving the motion to the mill. In such a mill the return of the tide through the may also be utilized. The other and less method involves the placing of a horizontal wheel in the water to be turned by the current either in ebb or flow. The motion mill is not uniform; it attains its greatest velocity at half tide and is suspended en the turn of the tide; but with exception its suspension a uniform velocity can act through the use of a regulating wheel. The old London tide-mills, in use river Thames, were built on a platform that was entirely above the water-wheel, the millworks having never attained success owing to the inconvenience of gular a motive power. But in recently constructed mills an attempt is made to observe carefully by the use of an ingeniously contrived device.

DEMAND, Adolph, Norwegian painter: ndal, 1814; d. Christiania, 1876. He at Copenhagen and at Düsseldorf under nw, afterward going to Munich and Among his works are the large historical compositions 'Gustavus Vasa: Addressing the Statesmen' and 'Devotional Meeting of the clergy'; and many genre subjects, such cycle of 10 pictures illustrating 'Norwegian Peasant Life'; 'Grandmother's Bridal Day', and 'The Wolf Hunter's Tale.' He r many years painter to the king.

DES. 1. Introductory.—Persons living near the sea, especially in regions familiar with the semi-ising and falling of the waters, which th generally amounting to only a few ight suffices to cover and bare by turns the greatest part of the sea-shore. Without tide or any knowledge of the moon's posi- or any knowledge of the moon's posi- approximate time of the tide can be deduced from the observed time of occurrence of the same day, by allowing 30 minutes for its retardation. Toward and after the time of high tide, the Romans were well acquainted with the phenomena of the ocean tides as the writings of Caesar, Sen- lini, Dürer, Claudianus, and others show. By referring to the tides on the continent, and by turning to the sea-shore, the sea-tide as well as the river-tide and the ocean-tide, the phenomena of the ocean tides have been made by Laplace, Kelvin, G. H. Darwin, H. Poincaré, and others.

Definitions, etc.—The tide is the periodic and falling of oceanic and other large body of water, due mainly to the attraction of the sun and the moon as the earth rotates upon its axis. The tides have a remarkable stage at a particular time, and the waters, whether rivers, seas, or other causes which probably have no law of recurrence, although popularly called "tidal waves," cannot be regarded as a tidal phenomena. The rising and is accompanied by, and depends upon, lateral or horizontal movements of the waters called tidal currents or tidal streams or the flow as ebb. Their periodic character distinguishes them from ordinary ocean currents. The tide rises until it reaches a maximum height called high water and then falls until it reaches a minimum height called low water. The difference in height between a high and a low water is called a range of tide. At most ports two high waters and two low waters occur each lunar day. The average length of a lunar day is 24 hours 50 minutes 28 seconds. The interval of time between the transit of the moon across the meridian and the occurrence of high or low water is called a lunisolar interval. The average value of the high-water lunisolar interval at any seaport is sometimes called the corrected establishment to distinguish it from the high-water lunisolar interval on the days of new and full moon, which is known as the estabishment, or the vulgar establishment, of the port.

At the times of new and full moon the tidal and sun act in the same direction, whereas at first and last quarters they oppose each other. When they unite their forces we have spring tides, characterized by large ranges of the tide; when they are opposed, neap tides, having small ranges. The spring and neap tides usually occur soon after the corresponding phases of the moon. The interval is called the retard or age of the tide, or the phase of the phase inequality, and is usually less than 60 hours. The lunisolar intervals have their mean values at the times of spring and neap tides; the tides occur a fraction of an hour earlier between spring and neap tides, and later between neap and springs. Other things being equal, the range of tide is greater than usual by about one-sixth part when the moon is near perigee and about as much less than usual when near apogee. An increase or decrease of about one-tenth part of the range occurs when the moon is near the equator or near its point of extreme declination, respectively.

Diurnal inequalities among the tides of a day are due to the presence of a diurnal wave or partial tide, whose period is approximately 24 hours. The cause of this wave lies in the fact that if the moon is north or south of the equator, its tidal forces are stronger both in magnitude and in direction when two times half a lunar day apart are compared.

3. The Tidal Forces.—All particles of the earth (the seas included) will continue to occupy positions fixed relatively to one another if no other forces are impressed upon them than the following: the earth's attraction; its centrifugal force of axial rotation; and a force acting upon all of its particles alike, for example, the centrifugal force due to the revolution of the earth about the centre of gravity of earth and moon. If an extraneous force does not act upon all particles alike, then motions will be set up in the yielding parts. The attraction of the moon upon a given particle (near the surface, say) is along a straight line (at any given instant) from the particle to the moon's centre; its intensity, which is inversely proportional to the square of the distance, and its local direction (that is, direction with respect to the earth's surface) continually change.
as the earth rotates upon its axis. The attraction of the moon upon a particle at the earth’s centre (or upon the earth as a whole) is along a line drawn from the earth’s centre to that of the moon; it is independent of the earth’s axial rotation. Because the action of the moon on the surface particle differs from its action upon the particle at the earth’s centre there results a tendency to produce motion relatively to the earth’s centre. A consideration of this tendency will enable us to answer the question why there should be two high waters each lunar day, instead of only one high water. In a single sentence, the reason is that the moon attracts the waters on the hemisphere facing the moon more powerfully than it does the earth; but attracts the earth in general more powerfully than it does the waters on the farther side of the earth. The difference between the action of the moon at any point of the ocean and its action on the centre of the earth is the tide-producing force at the specified point. It is not difficult to show that, to higher powers of the small quantity $a/r$, the vertical and horizontal components of the moon’s tide-producing force are very nearly

$$\frac{M a^3}{E} g (3 \cos^2 \theta - 1)$$

and

$$\frac{M a^3}{E r^2} g \sin 2\theta$$

respectively, where $M$ denotes the mass of the moon, $E$ that of the earth, $g$ the force of gravity, $a$ the mean radius of the earth, $r$ the distance between centres of earth and moon, and $\theta$ the zenith distance of the moon corrected for parallax. The numerical value of $\frac{M a^3}{E r^2}$, when $r$ has its mean value, is 0.000000056; and so the vertical force has a range of 0.000000188g, as has also the horizontal force. The solar tidal force is 46 per cent that of the lunar. The tides are mainly due to the horizontal component of the forces. These are the forces which deflect a plumb line, although by an amount so small that it can hardly be measured. The deviation, in case of the moon, amounts to only 0.0017 either way from the mean vertical. For a sufficiently deep body of water extending 163 nautical miles along the equator the range of tide at either end will be one inch.

The system of arrows in Figs. 1, 2, 3 are intended to represent the horizontal component of the moon’s tide-producing force at various places on the earth’s surface. The arrows catted upon the same small circle are to be of equal length, and all arrows posed to lie in a system of great circles met in a point directly under the moon, of course, in the antipodal point. At points and along a great circle midway them the length of the arrows is zero: in words, the force vanishes. The syst

![Fig. 2.](image)

rows is fixed with respect to the so sweeps over the surface of the moon performs her apparent daily tour. The system shifts somewhat when north or south of the equator. At any point on the earth’s surface, the moon 1 the equator, the horizontal forces are

![Fig. 1.](image)

![Fig. 3.](image)

magnitude and direction to the horizon at $P$, a point upon the same parallel as $P$, but 180° distant in longitude; amounts to the same thing, they move themselves at any given point $P$ every day, or 12h, 25m. 14s. on an average. The moon is not upon the equator, are generally not the same at $P$ and $P'$ in magnitude or in direction, and so do exactly repeat themselves every half 1. This alternation of the forces gives diurnal inequality in the tides. It tend that for places situated upon the equator, the forces have, when is upon the equator, a meridional directed from the poles toward the e
his component nowhere points from the 
\( r \) toward the poles; consequently the ex-
\( \epsilon \); of the moon causes the water (half-tide) 
at the equator to be higher than it would 
\( \epsilon \) have been. The moon's movement in 
\( \epsilon \) ation, therefore, causes a fortnightly fluctu-
\( \epsilon \) a in half-tide level. Similarly the sun 
\( \epsilon \) es a semi-annual fluctuation.

**Real Equilibrium Tides.**—If in the case 
\( \epsilon \) body of water, its free period be several 
\( \epsilon \) smaller than the period of the tidal 
\( \epsilon \), say less than three or four hours, the 
\( \epsilon \) will at every instant be normal to the 
\( \epsilon \) line as disturbed by these forces. In 
\( \epsilon \) ar, consider the mean lunar semi-diurnal 
\( \epsilon \) a deep lake situated in north latitude. 
\( \epsilon \) ce to Fig. 1. It may be inferred that 
\( \epsilon \) water will occur at a point south of 
\( \epsilon \) the e point when the moon is on meridian; at 
\( \epsilon \) it west of the no-tide point at 3 o'clock; 
\( \epsilon \) time; at a point north of it, at 9 o'clock; 
\( \epsilon \) with easters must be treated as aggre-
\( \epsilon \)

\[ \sigma \frac{d \epsilon}{d \epsilon} (3 \cos^2 \theta - 1) \]

\( \sigma \), the density of the water and 
\( \epsilon \) the earth. The numerical value of 
\( \epsilon \) is 1.17 feet. The corresponding value for 
\( \epsilon \) is 0.54 foot. If the \( \sigma \frac{d \epsilon}{d \epsilon} = 0 \), the range 
\( \epsilon \) of the lunar tide becomes 1.8 feet; 
\( \epsilon \) = 1, 1, the range becomes 4.4 feet. In case 
\( \epsilon \) the earth \( \sigma \frac{d \epsilon}{d \epsilon} = 1 \), \( \epsilon \)

\[ \sigma \frac{d \epsilon}{d \epsilon} \]

\( \epsilon \) the hypothetical tide just described can be 
\( \epsilon \) calculated for any time and place and is 
\( \epsilon \) as the uncorrected equilibrium tide. It 
\( \epsilon \) no resemblance to the actual tide of our 

**Some Dynamical Questions Involved in 
\( \epsilon \) subject.**—Because the requirements for 
\( \epsilon \) tides are seldom found in the 
\( \epsilon \) of heavy aggregations of 
\( \epsilon \) of heavy particles undergoing some kind 
\( \epsilon \) illatory motion. A progressive free wave 
\( \epsilon \) has as its velocity of propagation 
\( \epsilon \) for the maximum velocity of the 

\[ \sqrt{\frac{h}{g}} \]

\( \epsilon \) h denotes the 
\( \epsilon \) of the vertical movement. The longest 
\( \epsilon \) 10 days period of free oscillation of a 
\( \epsilon \) area or sheet of water is 

\[ \frac{2 \lambda h}{g} \]

\( \epsilon \) sheets tapered or sharpened at the ends oscil-
\( \epsilon \) late more rapidly than do rectangular ones of 
\( \epsilon \) same length, while sheets narrowed at the 
\( \epsilon \) riddle or broadened at the ends oscillate less 
\( \epsilon \) rapidly. The free oscillations of a given body 
\( \epsilon \) water can often be approximately deter-
\( \epsilon \) mined by comparing with a more simple body 
\( \epsilon \) whose motion is known. The given body need 
\( \epsilon \) not have a strictly uniform depth nor be com-
\( \epsilon \) pletely surrounded by land.

The general equation of motion for matter 
\( \epsilon \) a rotating sphere show that a moving 
\( \epsilon \) of unit mass is deflected or accelerated 
\( \epsilon \) relatively to the earth's surface, toward the 
\( \epsilon \) right in north latitude, toward the left in south 
\( \epsilon \) titude, as if by a force whose numerical value 
\( \epsilon \) velocity \( \times 0.0001458 \) sin (latitude), the veloc-
\( \epsilon \) being expressed in feet per second and the 
\( \epsilon \)ce in pounds (Ferrel's law). This divided by 
\( \epsilon \) or 32.1722 gives the transverse slope which a 
\( \epsilon \) river, or strait through which there is a cur-
\( \epsilon \)ent, will assume on account of the deflecting 
\( \epsilon \) of the earth's rotation.

**7. Hypothetical Dynamical Tides.**—The 
\( \epsilon \) case of an equatorial canal encircling the earth 
\( \epsilon \) simple and instructive, although bearing no 
\( \epsilon \) resemblance to any existing tidal body. If the 
\( \epsilon \) of the water be greater than 67400 feet, 
\( \epsilon \) high water will occur when the moon is on 
\( \epsilon \) meridian (above or below the horizon); if less 
\( \epsilon \) 67,000 feet, low water will occur when the 
\( \epsilon \) moon is on meridian. For the depth 67,000 feet 
\( \epsilon \) range of tide will become very large. If 
\( \epsilon \) depth be greatly increased, the range will 
\( \epsilon \) approach its equilibrium value, which is 1.8 feet 
\( \epsilon \) for the lunar tide; if this depth be greatly 
\( \epsilon \) diminished, the range will approach the value 
\( \epsilon \) 0.000,026 h, h denoting the depth. In the 
\( \epsilon \) latter case the amplitude of the horizontal displace-
\( \epsilon \) ment will be 137 feet. For the depth of 10,000 
\( \epsilon \) feet the range of tide is 0.31 foot and the am-
\( \epsilon \) plitude of the horizontal displacement 161 feet; 
\( \epsilon \) for the depth of 20,000 feet the corresponding 
\( \epsilon \) quantities are 0.74 foot and 196 feet, respec-
\( \epsilon \) tively. If friction proportional to the velocity 
\( \epsilon \) be introduced, the effect will be to displace 
\( \epsilon \) the crests of the lunar and solar wave with refer-
\( \epsilon \) ence to the moon and sun, but by unequal 
\( \epsilon \) amounts. To this has been attributed the age 
\( \epsilon \) of the tide.

**8. Partial Explanation of Ocean Tides.**—
From §§ 3, 4 an idea of the magnitude of the 

**equilibrium tide can be obtained. It represents**
the direct effect of the action of the moon upon 
the waters where the body is so small and deep 
that its motion can be ignored. In a larger 
body whose free period is quite different from 
that of the tidal forces it is reasonable to sup-
pose that tides even smaller than the equilib-
rium tides will be raised. In § 7 this was found 
to be the case for an equatorial canal of mod-
erate depth encircling the earth. Again, if a 
canal, bounded at each end, be so shallow that a 
wave-length \( \lambda \) extends through only a few 
degrees of a great circle, then even if its 
length approximates to \( \lambda \) the tides are obviously 
small because the tidal forces are distributed 
alike on both halves, while the particles move 
in opposite directions in the two halves. Re-
sults like these contrasted with those obtained 
from observing the tides of the oceans lead to 
the belief that, as a rule, the ocean tides as we 
know them are so great that they can be pro-
duced only by successive actions of the tidal forces upon oscillating systems each having, as free period, approximately the period of the forces, and each perfect enough to preserve the general character of its motion during several such periods were the forces to cease their action.

That oscillations according to one of the free periods may persist for a long time can be seen in the case of some seiches; for, a probably started by a meteorological force and sustained by no periodic force, in some harbors, straits, or bays, an exceptionally large number of oscillations before the said systems are to be carried away progressive waves or otherwise.

Suppose the oceans by reason of their and the configuration of shore lines to several such systems whose free periods nearly the periods of the tidal forces. It systems generally consist of still more sheets having like periods and which styled "areas." The times of tide can be by means of the following rule:

If to the particles of water in a given oscillating system, each area of uniform and wherein the resistances are proportional to the velocities of the particles, a series of harmonic forces having for period period of the body of water be applied, as permanent state established, then must the elongation be simultaneous with the when the virtual work of the external forces upon the system becomes zero.

The forces in various parts of the earth at various times or hours are those of 4, projected upon the lines of motion of the tides. The virtual displacements are at each assumed hour, but differ in parts of the system.

9. Cotidal Lines.—Although the cotidal in the ocean are generally real and distinct, seldom indicate the progression of a wave the rate due to depth; such progressions, however, exist in many shallow arms of the particular in tidal rivers. Because the principal ocean tides are due chiefly to oscillations, as has just been pointed out, one may expect to find extensive regions in the Atlantic Ocean extending from the eastern Greenland line to the Gulf of Mexico, the east coast of Central America, the western coast of the Philippines, the east coast of Africa, the northern coasts of Morocco and Portugal, and like these the rise and fall amounts to feet even off shore and in deep water.

The Arctic Ocean is characterized by progressive tides of small range derived from tidal forces. In the oceans, in certain arms of and in certain lakes are to be considered number of no-tide points due to various causes. From a point of this kind all cotidal lines belonging to a tidal and so these lines, or the tide which they show, are there said to be "amplitude of the tide." Excluding lakes and seas not common tidally with the ocean, and considerin
TIDES

semi-daily tides, about 25 no-tide points can be enumerated; a large percentage of these are to be found in straits and sounds.

A lake whose longest free period of oscillation is the same as that of the tidal forces will experience equilibrium tides and possess a no-tide point situated at the centre of gravity of the surface of the lake. The sequence of the cotidal lines about the point will be the same as that of the tidal forces. (Fig. 4.) For semi-daily tides the numbers will increase in the clockwise or counter-clockwise sense according as the point lies in north or south latitude.

In a strait or sound a nodal line is reduced to a no-tide point through the deflecting force described in § 6; around such a point the sequence of the tide is the reverse of that of the forces. If a no-tide point is due to the overlapping of two systems, the sequence depends upon the other tidal systems.

10. Peculiarities of Tides.—The distance between the Antarctic Continent and Australia being more nearly equal to the half length of a solar wave than of a lunar, causes the solar wave to appear comparatively large along the southern coast of Australia. The same is true, but in a lesser degree, for the region between the Antarctic Continent and South Africa. The distance from the Antarctic Continent to the Atlantic Coast of the United States being a little more than one and one-half lunar wave-lengths causes the ratio of the solar to the lunar wave to be comparatively small along this coast. If the ocean oscillate differently for different constituents, we can readily see reasons for considerable differences of epoch and so for remarkable instances of the tides.

If a tidal river be so shallow that the range of tide is a considerable fraction of the depth, ordinary wave-like oscillations of the water are no longer possible. The result is that as the wave progresses, the duration of the rise will be shortened and that of the fall lengthened. An extreme case results in a phenomenon called a bore — an advancing wall of water, which may be several feet in height, flowing up the bed of a river. A bore (see below) occurs in the Peruvian River, an affluent of the Bay of Fundy, its height at Moncton being three or four feet. Bores occur in several of the rivers of India, in several of western Europe, in the Amazon River, in the Tsien-tang Kiang and in Turnagain Arm, Alaska. Various other peculiarities in the shape of the wave are due to the shallowness of the water. A much contracted entrance to a bay not only reduces the range within, but alters the shape of the wave.

On the other hand, the range may increase as the tide passes up a funnel-shaped bay or estuary, and especially may this be the case when the bay has a large stationary oscillation related to the waters outside. The Bay of Fundy has at its head a spring range of nearly 50 feet, which fact depends upon both of these circumstances. But the large tides in Bristol Channel, England, and in Bristol Bay, Alaska, are due chiefly to the contracting and shoaling of these bodies.

A rule of thumb is that strong tidal currents occur in straits, tidal rivers, over shoals, and off capes.

Along the open coast and in the ocean at large, tidal currents generally set successively in all directions, the motion being elliptically harmonic or nearly so. This horizontal motion having two degrees of freedom is much harder to specify than is the tide, or motion defined by the rise and fall of the surface. Points at which the velocity ellipses or hodographs become circles may be styled circular points.

11. Tides in the Earth's Crust.—By these are meant the rise and fall experienced by the surface of the apparently solid earth due primarily to the tide-producing forces of the moon and sun acting upon the earth's crust and all matter within.

With the exception of § 5, we have made no mention of the attraction of the tidal forces upon themselves because the density of water is only 2/11 that of the solid earth, and the depth of the ocean is but a small fraction of the earth's radius. In the production of body tides not only is the direct disturbing action of the tidal forces involved, but also the attraction of the matter, however, disturbed upon itself.

Let \( \sigma \) and \( \sigma_e \) denote the rise and fall of the ocean's surface as measured from the earth's centre and expressed in terms of the earth's radius, \( \sigma_e \) being the rise and fall of the surface of the solid earth similarly measured; then the actually observed rise and fall of the waters surface relatively to the land is \( \sigma = \sigma_e - \sigma = m \).

The value of \( \sigma_e \) is required. From theoretical considerations of the direct and indirect effect of the tidal forces,

\[
\sigma_e = k_a \sigma_a = \frac{k_a}{1 - k_b \sigma_a} = \frac{k_a}{1 - k_b}
\]

where \( \sigma \) denotes the range of the equilibrium tide in an ocean of small density covering the earth, due to the direct action of the tidal forces; \( k_a \) and \( k_b \) are two moduli depending respectively upon the elasticity and internal constitution of the earth; \( k_a \sigma_a \) denotes the range of the deformation in the surface of the solid earth due to the direct action of the tidal forces.

Assuming that the day has not altered in length since the earth was in a fluid state, or when \( k_e = 1 \), we have observed ellipticity of the meridian due to diurnal rotation.

\[
\frac{1}{1 - k_e} = \frac{1}{1 - k_e} = \frac{297}{578} = 0.486
\]

whence \( k_e = 0.486 \).

The value of \( k_e \) can be determined by comparing the observed period of the movement of the axis of figure about the axis of rotation with the period of free precession (or 305 sidereal days) obtained upon the assumption of a rigid earth.

Another determination of \( k_e \) is obtained by comparing the observed range of the monthly or fortnightly tide with the equilibrium range due to the direct action of the tidal forces. This ratio or \( m/a \) is found to be about 3/5. Daily or semi-daily tides in a deep lake or in a buried pipe also give a determination of \( m/a \). The actual deviation of the vertical from its mean position, due to the daily or semi-daily tidal forces, and obtained by means of a horizontal pendulum, gives, upon comparison with the direct theoretical deviation, another determination of the ratio \( m/a \). If \( k_e \) be taken as 0.5, and \( m \) as 0.3, then by the above equation,
that the actual rise and fall of the surface of the *solid* earth is about 3/8 of the rise and fall of the surface of an ocean of small density surrounding a rigid sphere. If the latter be 1.8 feet (§ 5), the former will be about 1.2 feet. [This mode of treatment is due to Ch. Lallemant.]

12. Observation of Tides.—The height of the surface, at any given time can be directly observed upon a graduated fixed staff if the water be tolerably smooth. A long box fixed in a vertical position, having a small opening near the lower end, and usually supplied with a float, enables one to observe during stormy weather as well. In some instances only the times and heights of the high and low waters are observed and recorded. But a more satisfactory record is obtained by reading the gauge at regular intervals one hour or one-half hour apart.

Automatic or self-registering gauges are usually constructed for drawing a continuous curve. Such a gauge consists of a float and box, a time-piece, and some form of recording apparatus. The record from an automatic gauge can be procured with comparatively little trouble; it shows clearly the peculiarities of the tide; and it furnishes material for a thorough analysis or discussion.

The velocities and directions of tidal streams are usually ascertained by aid of a float and line or some form of current-meter. Such observations are attended with considerable difficulty because they must generally be made at some distance off shore.

13. Analysis of Observations.—If only the high and low water are to be treated, they are first referred to the moon's transit for obtaining lunntidal intervals. The ranges of tide are found at the same time. The intervals and the heights or low-ranges are next classified according to certain astronomical arguments for the purpose of bringing out the corresponding tidal inequalities.

The harmonic analysis rests upon Laplace's principle of forced oscillations, namely:

*The state of any system of bodies, in which the conditions of the motion have disappeared through the resistances which the motion encounters, is coteriodic with the forces acting on the system.*

Here is the clue to what oscillations ought to be found in the tidal wave; for, there ought to be an oscillation corresponding to each term of the causes producing the tide. Such terms follow from the development of the tide producing potentials of the moon and sun. Their arguments and *speeds* involve simple combinations of the mean longitudes and mean motions of the local meridian projected on the celestial sphere, the moon, the sun, the equinox, the lunar perigee, the solar perigee, and the moon's node. There are three principal classes of terms: semi-diurnal, diurnal, and long-period. If for a sufficiently long time the observation curve be read and summed with reference to any constituent or component defined by its "speed," the effects of the other components will gradually disappear and the final sums will pertain to the one sought (including, of course, its harmonics). To avoid reading the curve with reference to each component, the tabulation according to mean solar time is made to serve for all. This is done by distributing the (solar) hourly heights among the component hours as nearly as possible. This also shows the proper distribution of hourly heights as well as blank forms into which the heights are to be copied have been used quite extensively. For about 30 years perforated sheets, known as stencils, have been used for pointing out which hourly heights of the tabulation go with the various hours of the component sought. These enable one to dispense with the labor involved in copying into the various forms. Some years ago a set of movable scales or strips was devised upon which the hourly heights are copied once for all summations. Several machines have been devised or constructed for facilitating the work of analysis, but they have not yet come into actual use.

Through the 24 partial sums or means finally obtained for a given component (and its harmonics) imagine a curve to be drawn. It may be represented by a Fourier series whose coefficients and initial phases can be taken with little difficulty. Then by taking the initial phases from the proper astronomical arguments for that time, the required epochs will be obtained.

14. Prediction of Tides.—At most ports the time of tide can be roughly predicted by adding the time to that of the moon's transit, upper or lower, the average value of the lunntidal interval or *establishment* for the port. When the diurnal wave is not large, the height of high water above mean sea-level is roughly equal to half of the mean range of tide; the low water is as much below this plane or datum.

Where great refinement is desired, the process just referred to involves much labor, and can best be carried out after a tolerably complete harmonic analysis has been made. This done we have only to add together a series of cosine terms for obtaining the height of the surface of the sea at any given time. But the number of these terms is so great that such a computation would soon become laborious, since it must be made for many assumed times in each day's predictions. Several predicting instruments have been designed or constructed. Generally speaking, the object of such an instrument or machine is to combine several harmonic motions of suitable periods, phase and amplitude and to combine the results into one compound wave, or perhaps into two compound waves. The simplest form may be described thus: Upon one or more shafts, driven by hand or by clockwork, are fixed a number of wheels which mesh into other wheels, causing the latter (or wheels moved by them) to revolve with angular velocities having given ratios to the angular velocities of the shafts. These ratios are taken as nearly as possible, proportional to the speeds of particular tidal components. Rigidly connected to these wheels are cranks carrying pulleys, or pins working in slots and which impart to vertical rods carrying pulleys rectilinear harmonic motions. At one end of the machine a chain or flexible wire is made fast; hence it is laid alternately over and under the pulleys. Near to the other end of the chain or wire is attached a marking point (time, which is attached to the line of motion of the paper roll, traces the tidal curve. It is evident that the machine continually sums a series of cosine terms.

ROLLIN A. HARRIS,
Author of Manual of Tides.

TIDEWATER, arms of the sea, bays, and
waters where the tide ebbs and flows
lie, and all persons may use the same
purpose of navigation and fishing, un-
trained by law; in such waters the tide
ually ebb and flow. It is the rise and
water, and not the proportion of salt
fresh that determines whether or not
icular portion of a stream is within tide-
the same determination applies to small
as well as large ones. Open sea is the
of all nations; the rights and privileges
if any, being restricted to a specified
from the shore—generally three miles.
United States the titles to tidewaters and
vested in the States abutting thereon,
citizens, but are subject, however, to
stitutional rights of the United States.
gress of the United States, under its
ominate commerce, has the control of
able waters, and for such purposes
the property of the nation and to
islation; the test of navigability
whether or no the waters form a con-
highway over which commerce may be
on.

arious bathing beaches where the ocean
has become very valuable, private
parties and owners of bathing pavilions often
occupy the region between high and low water,
and shut out or try to shut the public there-
from. This they have no right to do. Neither
has any municipality a right to construct a
bridge over a tidewater stream so as to ob-
struct navigation, which is the public
right. The mariner also has the right to land
wherever the shore connects with a public
highway. Owners of land or a tidal shore have
right to build a pier or wharf for convenience
in landing and embarkation, but the mariner
passage along the tide line, and must not block
navigation. The right of fishing in tidal waters
cannot be stopped by any adjacent landowner,
though it is subject to local enactment for the
protection of fish. Oyster beds often lie in
tidal waters, and have been the subject of much
dispute. See Riparian Rights.

TIECK, Johann Ludwig, German drama-
ist and novelist of the Romantic School, known also under the pseudonyms, Peter Lebrecht and Gottlieb Faber; b. Berlin, 31
May 1773; d. Berlin, 28 April 1853. He was of
lowly origin, his father being a poor rope-maker.
From 1782 to 1792 he attended the Friedrichs-
werder Gymnasium in his native city, coming
under the influence of teachers with literary
inclinations (Rambach, A. F. Bernhardt), and
beginning a friendship with Wadem, father
that was to last until the latter's death.
His wish to become an actor was denied by his
parents, and he was obliged to go to the Uni-
versity of Halle (1792) to study theology and
philology, and to the University of Göttingen
(1792-95), where he took up modern philology
and literature. In 1797 he wrote cheap stories
for the apostle of enlightenment at Berlin, Nicoll
and, during a short stay in Hamburg, made
the acquaintance of Klostock and Schröder,
and became engaged to Miss Alberti (d. 1837),
whom he married the following year. He be-
came thoroughly well acquainted with all the
members of the early romantic school in Ger-
many, in 1788-1800, while living in the univer-
sity town of Jena (the two Schlegels, Novalis,
Fichte, Brentano, Gries), as well as with Goethe
and Schiller, who were living at Weimar,
short walk from Jena. For 15 years, begin-
ing 1802, Tieck and his wife lived, with few
interruptions, on the Ziehinger estate (near
Frankfort on the Oder) of his intimate friend,
Wilhelm von Burgsdorff (really the property
of the latter's uncle, Count Finkenstein). He
traveled in Italy (1804-06) with his sister Sofie
(1755-1833), who had married Bernhardt, and
in various libraries on this journey he became
acquainted with important manuscripts of
medieval German poems ('Nibelungenlied,' 'König
Rother,' etc.). In 1819 he settled in Dresden,
where he became (1825) manager of the Court
Theatre, with the title of Hofrat. The last
years of his life were spent chiefly at Berlin, to
which city he was called (1840) by King Fred-
reich William IV of Prussia, who greatly ad-
mired his work, and who granted him an annual
pension of 3,000 thalers. Together with Fre-
rich Schlegel (q.v.) and August Wilhelm
Schlegel (q.v.), Tieck was the founder of the
Romantic School in Germany, and while he was
not the most profound or original writer of this
movement, he certainly was its most versatile
member. His connection with C. A. Nicolai

LO, tē-ă pó lō, Giovanni Battista,
oletto). Italian painter: b. San
Castello, near Venice, 5 April 1696;
22 March 1770. He was a pupil
Lazzarini and followed as closely
in the footsteps of Paul Veronese;
reproduced in numerous wall
pictures. Many churches and pa-
cence were decorated by his hand.
he was summoned to Würzburg.
three years he worked in the arch-
dace on the wall paintings in fresco
'Four Quarters of the Earth,' and
Fréderick Barbarossa.' In 1754 he
to Vienna, where he was attached to
Art.
In 1763 King Charles III sum-
med to Spain to decorate the royal
ehere he painted 'Smithy of Vulcan,' is
Spain; and the ceiling frescoes
d her Provinces. He was the last
of the Venetian school. His
was superb, and his designs spiritual
issive even when the drawing was
incorrect. Among Tiepolo's easel pictures may
be named 'Christ in the Garden'; 'Adoration of
the Kings' (Imperial Gallery, Vienna); 'After the Bath' (Berlin Museum); 'Ennean-
uncate Conception' (Vicenza Museum, Vicenza); and 'The
-
Isabella' (1740). Many of his altar pieces are in the churches of
of Venice. A few of his paintings are in the
Metropolitan Museum, New York. Consult
Chenuviers, H. de, 'Les Tiepolo' (Paris 1888); Ghelof, Urbanide, 'Tiepolo in Spain' (Venice 1881); Molmenti, P. G., 'G. B. Tie-
polo' (Milan 1910); 'Masters in Art' (Vol.
VI, Boston 1907).

TIERNAN, Frances Fisher ('CHRISTIAN
Rein'), American novelist: b. Salisbury, N. C.,
5 July 1846. Among her many works are
'Valerie Aymar' (1870); 'Morton House'
(1871); 'Nina's Atonement' (1873); 'A
Daughter of Bohemia' (1873); 'A
Question of Honor' (1875); 'The Land of the Sky,' a
volume of travel (1875); 'Donny Kate' (1879); 'Hearts of Steel' (1882); 'Mervin Churichill' (1887); 'Philip's Restitution' (1888); 'Armine'
(1884); 'The Land of the Sun' (1894); 'The
Picture of Las Cruces' (1895); 'The Man
of the Family' (1896); 'Weighed in the Balance'
(1901); 'A Daughter of the Sierra' (1903); 'Princess Nadino' (1908); 'The Light of the
Vision' (1912); 'The Daughter of a Star'
(1913); 'A Far-Away Princess' (1914); 'The
Secret Bequest' (1915). In 1909 Mrs. Tiernan
was awarded the Larteg Medal by the
University of Notre Dame.

TIERRA DEL FUEGO, tē-ĕr-rā del fwa-
-gō, an archipelago at the extreme south
of South America, separated from the mainland
by the Strait of Magellan which forms its
boundary on the north and northwest, while
the Atlantic Ocean bounds it on the east and
the Pacific Ocean on the southwest; total area
about 19,299 square miles. Politically, it is
divided into two parts, each of which will be
briefly described.

(1) The western part, the area of which is 11,000 square miles, belongs
to Chile and is included in the extensive Chilean
territory of Magallanes, whose capital, the
little town of Punta Arenas, stands on the
western (mainland) shores of the strait, and
is a port of call for steamship lines between
Europe and Australian lines (Hamburg to Cal-
lo, etc.). The lands belong to the state.

(2) The eastern part, area 8,299 square miles and
population about 1,000 whites and several thou-
sand Indians, belongs to Argentina and forms
a territory of that republic, its capital being
Ushuaia. Of this region about 1,000,000 acres
have passed into private ownership and only a
small proportion is rented. In the north there
are fertile valleys and roads connecting the
villages lead through Chilean territory to ports
on the southern coast of the Strait of Magel-
lan. The interior is mountainous or hilly, but
well adapted to stock-raising. "The climate of this region," it is said, "though cold, is not
severe, inasmuch as the mean temperature,
maximum and minimum, as taken during sev-
ral years, is +5° C. and —10° C, respec-
tively. Calm days are frequent in winter.
Rain increases in the autumn, and in the
summer dry winds from the southwest and west
prevail, and occasionally are of terrific force." (Consult 'Argentina Republic: a Geographical
Sketch,' issued by the International Bureau of
TIERS-ETAT—TIFFANY

American Republics, Washington 1903). There are no navigable rivers, but many streams of moderate size and a number of lagoons. The oldest and in some respects still the most interesting description of the region of the famous strait (of which both shores are now held by Chile) is that written by Anthony Pigafetta, who accompanied Magellan and told of what they saw in October 1520, mentioning the characteristic storms, the very great and high mountains covered with snow, surrounding the strait, and finally saying: "In it we found at every half league a good port and place for anchoring, good waters, wood all of cedar and fish like sarines, missiglioni, and a very sweet herb named appio (celery). There is also some of the same kind which is bitter. This herb grows near the springs and from not finding anything else we ate of it for several days. I think that there is not in the world a more beautiful country or a better strait than this one." Pigafetta's sketch map of Magellan's Strait proves that he regarded Tierra del Fuego as a great southern continent stretching toward the antarctic pole. Consult Lord Stanley of Alderley, 'The First Voyage Round the World,' printed for the Hakluyt Society.

TIERS-ETAT, ti-är-zä-tä, the third estate, a name early given in France to the free bourgeoisie, to distinguish them from the nobility and the clergy, the other two estates. The three estates together formed the états-généraux or States-General, a legislative body which might be compared to the English Parliament. The third estate became famous in the political upheaval in France at the end of the 18th century, when, in the last States-General, it claimed power equal to that of both of the other orders. In 1789 it assumed the name of the National Assembly, and by its subsequent assumption of supreme power consummated the French Revolution. See France—History From Revolution to Empire.

TIJTJENS, ti-yens, or TITIENS, Therese Johanna Alexandra, German soprano singer of Hungarian descent; b. Hamburg, 17 July 1831; d. London, England, 3 Oct. 1877. She made her début in her native city as Lucrezia in the opera of "La Donna Borgia" in 1849, and her after career was one of great success, as she not only possessed a voice of great power and purity, but was an actress of much ability likewise. She made her home in London after 1858. In 1875 she visited the United States singing in "Don Giovanni" and other grand operas.

TIFFANY, Charles Lewis, American manufacturer; b. Killingly, Conn., 15 Feb. 1812; d. New York, 18 Feb. 1902. In 1837 he began his business career in New York, where in partnership with John B. Young he opened a stationer's store, to which were added Chinese and Japanese works of art and later French jewelry. The business founded on borrowed capital of $1,000 grew rapidly, the jewelry trade soon becoming the most important. In 1848 the firm was enlarged, jewels, bronzes and other articles of v rt, and to manufacture gold and silver ware. The same year when the value of the diamond was so depreciated because of the unsettled conditions in Europe, Tiffany instructed his partner, at the time being in France, to buy as many diamonds as he could. Through this venture the reputation of the house among leading diamond merchants was established. In 1851 the name became Tiffany and Company, and the firm was incorporated in 1858. Changing conditions from time to time necessitated removals farther uptown, until the business was located at the present site in 1905. Mr. Tiffany was known as the chief diamond merchant in the United States, and his country houses, also well known in London and Paris. The standard for sterling silver, 0.925 fine, now recognized throughout the entire country, was adopted by him in 1831. He was a liberal patron of the fine arts.

TIFFANY, Louis Comfort, American artist and decorator; b. New York City, 18 Feb. 1848. In early life he evidenced a strong inclination toward the fine arts; hence his parents wisely gratified his tastes and educated him for an artist. He first studied with George Inness and Samuel Coleman in New York, then with Léon Bailly in Paris. He spent five years in Europe and the Orient, and besides working in water colors and oils, devoted much of his time to the study of the decorative arts. He became interested in glass and its possibilities in the early 70's and revived the mosaic theory in the construction of colored glass windows. Believing that work executed upon this principle would give the best artistic results, but finding that the glass in the market did not have the range of color and texture necessary to carry out his ideas, he began a series of experiments through existing glass houses, but these failed to grasp his thoughts he established works of his own. He succeeded in producing not only many of the finest effects that were obtained in the past, but also discovered new formulas by which he could make glass unlimited in its range of color and texture. With this glass, which is known as "Tiffany favrile glass" he has not only made windows of great beauty, but also vases and different objects of artistic interest which at once commanded the admiration of the world. In 1878 he organized a company under the title of Louis C. Tiffany and Associated Artists, for the purpose of promoting the decorative arts in America and particularly the development of the making of colored-glass windows. This was the foundation of the business. The glass blowing branch was first established as the Stourbridge Glass Company, and subsequently the Tiffany Furnaces. The general manufacturing and merchandising began under the name of the Tiffany
TIFFANYITE — TIFFIN

Company, which in the development and
ning of its business became the Tiffany
and Decorating Company and the Allied
company which are now more generally
as the Tiffany Studios. One of his
notable works in mosaic is the Chancel
Crypt in the Cathedral of Saint John
Evangeline in New York, executed in glass
and semi-precious stones. Another
example is the interior decoration of
Madison Square Presbyterian Church
in New York. But while there are hundreds
at Tiffany windows and many
of them entirely decorated by his artists, eccle-
sical work is only one of the many branches
varied artistic achievements. In domes-
orative work his two dwellings, the city at
Madison avenue and 72d street, New
York, the "Bungalow at Briarcliff"
and "Laurelin," his country house at
Bay, L. I., are varied examples of his
uality and taste. Many of the most
cities, university halls, hotels, and
and other buildings in New York, Bos-
ton, and other large centers have been
ted by his art workers. Louis C. Tiffany
aps more widely known through his work
is, mosaics and interior decorations, as
aturally appeal to the popular taste and
attention by their exposure to public
His genius, however, has not been re-
even to these varied fields, but he has
lly sought employment wherever artistic
could give expression. His studies in
tries and his exhaustive laboratory work
advances possibilities beyond the realms of
He has worked successfully in tapestry,
other materials, pottery, metallic lust-
emals and in later years he has given
ought to art jewelry and silverware, all
ch, however, have not weaned him from
love of the brush. He was from the first,
to-day, a painter and works with his
not only in his studios in town and
t also on his annual trips abroad. After
his winter sojourns in Egypt he brought
1906 over 23 water colors which he ex-
while sailing in his dahabiya—on the Nile.
at colors and pictures in oil are fre-
ly seen in the galleries of the art clubs and
exhibitions. Among his principal can-
te: "Spring" (1886), "Scene in the Country" (1886); "Wading at Seahurst, N. J." (1876); 5; "Scene in Tangiers" (1876); "Study of
er, Brittany" (1877); 6; "Duane Street, New
(1878); 7; "In the Fields at Irvington, N. H."; 8; "The Cobblers at Beaumaris; 9; "Feeding the Flamingoes" (1888); 10; "in Morlaix, Brittany" (1890); "Market
ppers on the Nile" (1892); 11; "Street Scene in
s" (1893); 12; "Algerian Shop" (1895). Tiffany, as president of the Tiffany
president and art director of the Tiffany
Furnaces and vice-president and art di-
of Tiffany and Company, the jewelry
founded by his father. He was made a
Garden City, New York, in 1914.

TIFFANYITE. Certain bluish or bluish-
white diamonds, principally from Brazil, al-
though a few have been found in India and
South Africa, phosphoresce for a consid-
time after having been exposed to bright sun-
light, electric light, or other brilliant rays.
This property results from the inclusion in the
diamond of a hydrocarbon or a rare earth, and
for this class of diamonds the New York
Acaemey of Sciences (1890) has given it the
name "tiffanyite." 12

TIFFIN, Edward, American physician,
preacher and politician; b. Carlisle, England,
June 1776; d. Chillicothe, Ohio, Nov. 28, 1829.
About 1786 he went to Charlestown, Va., and
in 1789 was graduated in medicine at the Uni-
versity of Pennsylvania. Three years later he
became a local preacher in the Methodist
Church, likewise studying law and engaging in
the practice of medicine. About 1797 he re-
moved to Chillicothe, in what was then the
Northwest Territory, was elected to the Terri-
torial legislature and in 1799 was speaker. He
was chosen president of the convention which
framed the State constitution (1802), and be-
came first governor (1803—07) of Ohio.
The town of Tiffin in that State was named for him.
He arrested the Burr-Blennerhassett expedition
in 1808. (See BLENNERHASSETT, HARMAN; BURL, AARON.) He was a United States sena-
tor in 1807—09, resigned in the latter year to
assume the speakership of the Ohio legislature.
He was the first commissioner of the General
Land Office (1812), and at the burning of the
National Capitol by the British in the art work
papers from destruction. In 1815 he was made
surveyor-general of the Northwest Territory
and continued in that office almost until the
end of his life.

TIFFIN, Ohio, city, county-seat of Seneca
County, on the Sandusky River and on the
Baltimore and Ohio, the Pennsylvania and the
Cleveland, Cincinnati, Chicago and Saint Louis
railroads, about 80 miles north by west of
Columbus, the State capital and 40 miles south-
east of Toledo. It was settled in 1817 by Eras-
tus Bowe, and incorporated in 1835. In 1836 it
was chartered as a city. It is the commercial
and industrial centre for a large portion of the
country, in which are many fine farms. In the
vicinity of Tiffin are deposits of clay and glass-
and. The chief manufacturing establishments
of the city are machine shops, glass works, pot-
teries, wagon and carriage works, motor truck
works, gloves and mitten works, candy factories,
breweries, iron works, planing mills, emery-
wheel works, flour mills and furniture factory.
There are about 5,000 employees in the city's
manufactories. The principal public build-
ing are the courthouse, the municipal build-
gs, the churches and schools. There are 16
churches, representing 10 denominations, and
TIFLIS — TIGER-CAT

Saint Francis Hospital and Home. The educational institutions are Heidelberg University (Reformed), opened in 1850 (nearly 650 students in 1915), Ursuline College, public and parish schools and two librarieis. Tiflis is the location of the national home of the Junior Order of United American Lineage, containing about 400 children. The four banks have a combined capital of $500,000; the annual business done through the banks amounts to over $3,000,000. The government is administered under a board of public safety, board of public service and council of seven members elected by wards and at large. Pop. 14,256.

**TIFLIS,** tif'les', Russia, the capital of the government of Tiflis in the general government of Caucasus (see Transcaucasia), situated at the southern base of the Caucasus about midway between the Black and the Caspian Seas. It is picturesquely built on terraces rising from the valley of the Kura, and surrounded by orchards and vineyards. Some walls and towers of the old fortifications remain, and there are parks and botanical gardens. Among the numerous churches the most interesting is the cathedral of Zion, dating in part from the 5th century. Other notable buildings are the palace of the governor-general, the Caucasian museum and library. The educational institutions include nearly a dozen high schools, besides numerous technical schools, one of the foremost of which is the finely equipped school of commerce. The chief industries are the manufacture of leather, oil, silk, woolens, clothing, and, more especially, wines and several breweries and distilleries. Commerce has declined somewhat, though the city is connected by rail with both the Black and the Caspian Seas. Pop. 27,900.

**TIGER,** the largest and most admirable of the cats (*Felis tigris*). In size and power it surpasses the lion, as it does in beauty, and expresses the highest type of feline structure. (See FELINE.) The ground color of the body is a bright tawny yellow, bearing black stripes running at right angles with the general axis of the body and having their inner aspect in the limbs are white, as also are the throat and chest. On these white parts the stripes are lighter, and gradually merge into the white color. The tail is not tufted at its extremity, and is usually of lighter hue than the body, with dark rings. White or allino varieties of the tiger have been found, as also black ones. The maximum length, including the tail, is about 11 feet, and the largest weigh about 500 pounds. The tiger attains its full development in India, the Bengal variety being the largest and most typical; but it also occurs in southern Siberia, Turkistan, Persia, Java, Sumatra, China and Japan, encountering a range of climate from tropical to sub-arctic conditions. In habits these animals are far more active and agile than the lion, and exhibit a large amount of fierce cunning. They generally select the neighborhood of water-courses as their habitat, and spring upon the animals that come to drink from it, or even to more retired spot to be devoured. The march of the animal through the thick brushwood of the jungles in which it lives is noiseless and stealthy, and it appears rather to avoid than to court danger, although, when brought to bay, no animal presents a fiercer front than the tiger. Where deer, antelopes and wild hogs are abundant, domestic animals are comparatively safe, but otherwise the tiger is ready enough to prey on the latter. When pressed by hunger or enfeebled by age and incapable of dealing with larger prey, the tiger prowls around villages, and, having once tasted flesh, becomes a confirmed cattle-lifter and man-eater, sometimes causing the temporary abandonment of a large district by the terror-stricken inhabitants; and in several historic instances districts of country in southern India, Indo-China and the adjacent islands have been deserted premonently because so infested with tigers harbored by neighboring swamps and jungles. The number of persons killed by tigers each year in India averages about 930, mostly in Bengal, Madras, Central Provinces, Assam and Burma. About 32,000 head of cattle are also killed annually in India by tigers.

The natives destroy tigers by traps, pitfalls, spring-guns and poisoned arrows, but the orthodoxy box method of keeping down numbers as pursued by Europeans is to employ dogs to beat the bush while the game, when started, is shot by the sportsmen seated on elephants. The sport is exciting, but dangerous; for a wounded tiger has been known to spring on an elephant and to inflict serious wounds on the driver and occupants of the howdah, before it could be dispatched. A safer and more common method is to tether a live goat, or otherwise set a bait in a place where a tiger may be expected, then erect a platform on poles or in a tree near by, and await the animal's approach on a night when moon or stars shed light enough to enable the watcher to shoot his prey.

These great cats have always been kept as a captivity by Oriental rulers, and now and then have been completely tamed. They have been a feature of every menagerie and animal trainer's show since such collections began to be formed, and as they readily breed in captivity the supply will easily be maintained. Consult Baker, 'Wild Beasts and their Ways.' (London, 1890); Lydekker, R., 'The Game Animals of India' (ib. 1888); Lydekker, R., 'The Game Animals of India' (ib. 1907); Porter, 'Wild Beasts' (New York 1894), and books on sport and travel in India and the East Indies.

**TIGER-BEETLE,** a beetle of the family **Cicindela,** in which the head is wider than the thorax, and the terminal hook of the mandible jaws is jointed at its base. This insect is swift and active, and preys upon other insects. It is very often found in sandy places and the large live in straight deep burrows in the ground. The color varies, corresponding as a rule to the general coloring of the surroundings. This beetle is more common in the tropics. Over 1,500 species are known, less than 100 of which have been found in the United States. Some species are wingless. See plans accompanying the article *Insecta*.

**TIGER-CAT,** a name of not very definite signification, and given to those animals of the family *Felidae* which are of medium size and somewhat resemble the tiger in form or markings, such as the chati, margay, serval, etc. In America the ocelot (q.v.) is most often meant. The marbled tiger-cat is a small bea-
variegated species (*Felis marmorata*) eastern Himalayan region.

**ER-EYE**, a semi-precious, chatoyant f blue, yellow or brown color, which a charming change of colors when re-
it. The original mineral is changedration of silica and when accompaniedoxidation of its iron its blue color is to severe brown. It is extensivelywatch charms, cuff buttons and manyarticles which are largely sold at manyresorts, often, though fraudulently, asorigin, the mineral being found only inSouth Africa. See Crocodile.

**ER-FLOWER**, a Mexican plant (*Tig-nonia*) of the iris family, frequently used for the brilliance and oddity of its These are solitary, terminal and cup-
in the centre, but have a wide-spread, formed by the three oblong clawed x of the perianth, which are the largest, brilliant red at the outer edge, shading n, spotted with reds and purples at the 'he three inner segments are fiddle-
The flowers are fugacious, lasting only a day, but there is a long succession of there are many varieties of these Ti-in which the hues of the corollas range various shades of yellow to white. m is about a foot high, slightly zigzag nched; and it bears a few alternate dis-
se, the greater number of the leaves dical and sword-shaped. The internode ed to be lifted into a dry place out of f frost during the winter, as they are rdy in the northern United States. s are propagated by seeds or offsets. re other species of the genus, which are ransome or conspicuous as *T. pavonia*; them have bluish flowers.

**ER LAKE.** See Nahuel-Huapi.

**ER-LILY.** See Lily.

**ER-MOTH**, one of the large moths of *Arctia*, the caterpillars of which are as "woolly ears" because of their own ears, and known as "wooly ears."n
**ER SHARKS**, a shark (*Stegostoma*) common in the Indian Ocean. The wn fish, from 10 to 15 feet long, fre-
t open sea. The color is a yellowish-
with black or brown transverse r spots.

**ER-SNAKE**, a large blackish, yellow elapid poisonous serpent (*Notechis*), widely disseminated in australia and ia, and very numerous.

**HE**, ti, *Mary* (Blachford), Irish poet: in, 9 Oct. 1772; d. Woodstock, County y, 24 March 1810. She was married to Sir, Henry Tighe, in 1793. Though her Psyche, or the Legend of Love, was 3 printed (1805), it was only after her at her complete writings were published. st edition was in 1811, and they have been reprinted. "The 'Psyche' is in the Spenserian stanza and is founded story of Cupid and Psyche as narrated Golden Ass of Apuleius. Her other are chiefly of a religious cast. It is as the subject of Moore's lyric, "I saw thy form in youthful pride" and of Mrs. Hemans' "Grave of a Poetess," that Mrs. Tighe will be longest remembered.

**TIGRANES** (*tig-rá-néz*) I, king of Armenia, 96 to 55 B.C. A descendant of Artaxias, the founder of the Armenian kingdom, he brought under his rule large accesses of territory in Syria and Mesopotamia, and in 83 B.C. had acquired most of the provinces of Syria from the Euphrates to the sea. By his marriage with the daughter of Mithridates, king of Pontus, he formed an alliance with that monarch disastrous to the smaller kingdoms of Asia Minor. He invaded Cappadocia in 78 and completely subjugated its inhabitants. Other wars followed and Tigranes became the mightiest king in Asia. He built the new capital, Tigranocerta, whither he transplanted the inhabitants of many captive places, including Cappadocia, Syria and Cilicia. His possessions were wrested from him by the Roman general Lucullus, but were nearly all recovered by Tigranes, only to be lost again to Pompey in 66. In the final defeat of Tigranes, Pompey was aided by the rebel son of the Armenian king, who claimed the throne. The troops of Gordyene and Sophene for himself. Tigranes was able to retain only Armenia proper, for which he was obliged to pay Pompey an enormous sum and to subsidize the entire Roman troops under him. Tigranes was succeeded by his second son, Artavastes. Consult Reuchel, T, 'Mithridate Eupator roi de Pont' (Paris 1890).

**TIGRIS**, *tigrís*, Asia, an important river which rises near the Euphrates (q.v.) from two sources. The western and chief branch rises near Kharput, and under the name of Dejleh or Shatt, flows southeast. After passing Diarbekir it receives the eastern branch, flows past Mosul and Bagdad and joins the Euphrates at Kurna; together they form the Shattal-Arab and thus enter the Persian Gulf. The stream waters the ancient Nineveh, and separates Assyria from Mesopotamia on its way to Bagdad. It is only navigable for small boats and its entire length is 1,150 miles. Keels, or large rafts, supported by inflated skins, are much in use for the transportation of freight. The chief tributaries are the Greater and Lesser Zab and the Diyala. The biblical name of the river is Hiddekel.

**TILDEN, Douglas**, American sculptor: b. Chico, Butte County, Cal., 1 May 1860. He lost his hearing in early life and was graduated from the State Institution for the Deaf in Berkeley, Cal. (1879). Taking up the study of sculpture in 1887 at the National Academy of Design, New York, and later abroad, he was appointed a member of the jury on sculpture at the World's Columbian Exposition in Chicago. He was elected a member of the National Sculpture Society, the New York Art Club, the San Francisco Art Association, etc., and was professor of sculpture at the Mark Hopkins Art Institute (1894-1900). His works include 'Base-Ball Player'; 'Tired Boxer'; 'Indian Bear Hunt'; 'Football Players', etc.

**TILDEN, Samuel Jones**, American lawyer and statesman: b. New Lebanon, N. Y. 9 Feb. 1814; d. Greystone on the Hudson, near Yonkers, N. Y., 4 Aug. 1886. He was educated at Yale and at New York University, being graduated from the latter in 1837. He then
studied law and was admitted to the bar in 1841. He attained the first rank in his profession, being particularly successful in reorganizing corporations involved in litigation, and amassing one of the largest fortunes ever gained in the practice of law. While a student in college, he had taken an active part in politics, writing and speaking in favor of Martin Van Buren's policy; in 1845 he was elected to the New York State legislature and was a member of the committee to consider the settlement of anti-rent troubles. His report on the subject forming the basis of subsequent legislation. In 1846 he was a member of the State constitutional convention and in 1848 was one of the delegates of the Free Soil faction of the Democratic party to the National Convention, but his political activity then slackened until after the Civil War. During the war, however, he was several times consulted by President Lincoln; he believed that the war, once begun, must be carried through by the Federal government, but opposed any acts of the administration as unconstitutional. In 1866 he was made chairman of the Democratic State committee and in 1867 was a member of the State constitutional convention. As chairman of the State committee he took a leading part in the overthrow of the Tweed Ring, opposing their delegates in the State conventions and being active in collecting evidence against their leaders and bringing them to prosecution; in 1872, having been elected to the State legislature, he was the leader in the impeachment of two of the Tweed judges. (See TAMMANY SOCIETY; TWEED, W. M.). In 1873 he resigned as chairman of the State committee; but in 1874 was nominated and elected Governor of New York. His administration was notable for his successful exposure of the "canal ring," an association made up of persons who obtained contracts for canal work which they never fulfilled, but for which they were paid, and their political supporters. Governor Tilden employed a skilled engineer to examine their work and then surprised the legislature by a word and special message setting forth in detail the fraudulent methods of the "ring." This served as a direct appeal to the people; and so aroused public opinion that the legislature was forced to authorize the governor to appoint a calls for their Commission. The report of this commission resulted in a marked diminution in the appropriation for canals and the indictment of several officials for defrauding the State. In 1876 Tilden was the Democratic nominee for President of the United States, and received the largest popular vote, but lacked one electoral vote necessary for his election. As the electoral votes from several States were contested on account of alleged fraud, the matter was referred to a special Electoral Commission made up of members of the Republican candidate, Rutherford B. Hayes. (See ELECTORAL COMMISSION). Popular excitement had run high and many Democrats still claimed Tilden's election, but he urged his supporters quickly to cut down the size of the commission. In 1880 and 1884 his party again wished to nominate him for the Presidency, but each time he declined the nomination. He bestowed the most of his fortune to establish a public library in New York, but the will was contested by the heirs and only a part of the request came into the city's possession. (TILDEN FOUNDATION). Consult 'Writ Speeches of Samuel J. Tilden' (ed. by Bigelow, 2 vols., New York 1885); 'Lehman Literary Memorials of Samuel J. Tilden' by John Bigelow, 2 vols., ib. 1908; J. 'Life of Samuel J. Tilden' (2 vols., 1895); Haworth, 'Disputed Presidency of 1876' (Cleveland 1906).

TILDEN, (Sir) William Augustus, a scientist: b. London, 15 Aug. 1842. He graduated in various schools of the College of Chemistry; in 1864 became stratographer of the Pharmaceutical Society, 1872-80 science master at Clifton College; in 1888 professor of chemistry, Mason College; in 1890-91 president of the College of Chemistry, 1891-94; treasurer of the Society, 1899-1903 and president, 1903-05; professor of chemistry, Royal College of Science, London, 1894-1900, and dean of the college, 1903-1905; emeritus professor in the Imperial College of Science and Technology, 1908. He was awarded the Hon. medal of the Royal Society, the numerous scientific papers and in books: 'Introduction to Chemical Philosophy' (1889); 'Practical Chemistry' (1888); 'An Introduction to the History of Chemistry' (1891); 'A Manual of Chemistry' (1890); 'A Short History of the Progress of Scientific Chemistry' (1899); 'Elements' (1910); 'Chemical Discovery Invention in the Twentieth Century' (1908); and 'Sir William Ramsay' (1918).

TILDEN FOUNDATION. The, the integral components of the New York Public Library Fund. By the will of S. J. Tilden (q.v.) the bulk of his property left for the establishment of the Tithe Trust Fund to found a free public library and museum in New York. This will was contested long in the courts and was broken in the property being decreed to the heirs of William B. Hazard, one of the latter. At the hearing of this decision he relinquished about $2,000,000 of his property in order that Tilden's wishes might be out to some extent. In 1893 an agreement was reached whereby the trustees of the Astor Library and the New York Public Library agreed to unite their properties into one New York Public Library. The Astor, Lenox and Tilden Foundations city of New York subsequently agreed to the site of the old Astor Library, 40th to 42d Street on Fifth avenue, a spacious and spacious structure for these libraries. The work was begun in 1900 and completed in May 1911. See L.

TILEFISH, a large oceanic fish (timius chameleonpticus), allied to the alimentary to the family Malacombria, described by the planquilla and other flat-fishes of the Pacific coast, from 10 to 40 pounds and is big-brilliantly colored, with a curious...
ely deep water to the southward of an inlet and on the edge of the Gulf where it was taken in considerable num-
n the spring of 1882 vessels arriving at ar reported having passed through great 
 fish and during fishing, the water
muckly dotted with them for miles. From
in brought in, it was found that the ma-
ese were tilefish, while from the re-
various vessels it was shown that the
vered by dead fish amounted to some-
months worth of 7,500 and a total number of dead estimated at
from a billion. This enormous and
ad destruction is believed to have been
by an unwonted duration of northerly
stier winds, which drove the cold
urrent inshore and southward, chilling
belt in which the tilefish resided and
ill in that locality. It was thought pos-
it the entire race might have been de-
, while none were taken for many
1899 and 1900 a number were caught,
that the species was beginning to re-
the waters from which it had been
years before. Consult Lucas, 'Animals
ast' (New York 1902) and 'Reports'
illeged by the New York Fish Com-
especially for 1884 and 1899.

Such tiles are often enameled and are
dered waterproof. Slate, marble and
of tiles are occasionally employed.
ior tiles are made in great varieties of
sizes, colors and materials, ranging
from fine brick-clay tiles to those of enameled
and painted porcelain. They are used for
vements, flooring and revetments to walls.
Old houses in the south of Europe were
commonly paved with red brick-tiles baked hard
and sometimes glazed. The method of decora-
tion usually employed was to inlay clays of
different colors in the bodies of the tiles, pro-
ducing designs often of great beauty. Enameled
tiles were used in the 15th and 16th centuries
for the pavings of interiors of importance, such
as chapels, chambers of honor, etc. These
thin, enameled tiles broke easily and only a few
examples are to-day preserved in the cathedrals
and castles of France and Italy. The use of
tiles for wall revetments and for dados was
not general during these periods but has grown
in recent years. Modern wall tiles are usually
painted or glazed and are of various fine clays,
not infrequently of porcelain. Large wall
spaces are covered with painted tiles in pic-
torial or decorative composition, the work of
Théodore Deck affording some fine examples.
Tiles with slightly raised figures are also used,
the style having been borrowed from the Persians
who are masters of their manufacture.
A recent effective use of colored clay tiles may
be seen in the subway stations in New York,
where especially pleasing effects have been in-
expensively produced by the judicious selection
and blending of colors. Modern usage does
not follow the example of the Middle Ages
in the employment of carved and leaded marble
tiles. In these latter the variously shaped
slabs of stone were incised with intricate and
elaborate designs and the incisions filled with
lead or colored compositions and sometimes
with fine mosaic work. Consult Church, W. A.,
'Patterns of Inlaid Tiles,' etc. (1845); Herdile,
H., 'Vorlagen für das polychrome Dach-
onornament' (1885); Jones, Owen, 'Designs in
Mosaic and Tesselated Pavements,' etc. (1842);

TILGHMAN, Thomas, Mathew, American
patriot; b. Queen Anne County, Md., Feb.
1718; d. Talbot County, Md., 4 March 1790.
He was a member of the Maryland assembly in
1751 and as a magistrate and prominent member
of Talbot County was a member of the
committee which drew up the Maryland pro-
test to the Stamp Act. In 1774 he was made
president of the Provincial Congress or Con-
vention which controlled the affairs of the
colony until its statehood, and in 1777 repres-
ented Talbot County in the Provincial Senate.
He was a delegate to the Continental Congress
1775—77 and was throughout the entire pre-
Revolutionary period a staunch defender of
the cause of independence and an able advocate
of civil rights.

TILGHMAN, Tench, American soldier,
nephew of M. Tilghman, q.v.; b. Queen
Anne County, Md., 25 Dec. 1744; d. Baltimore, Md.,
18 April 1786. His career as a merchant in
Philadelphia was interrupted by the Revolu-
tion. He joined the Continental army at the
outbreak of the war and was one of the of-
cers sent to confer with the Six Nations.

Vol. 26 — 40
1776 he was appointed aide-de-camp to Washington, in which position he continued to the close of the war and in this capacity was entrusted with the hearing of the surrender of Cornwallis at Yorktown on 19 Oct. 1781. In May 1781 he was made lieutenant-colonel to take rank from 1 April 1777. At the close of the war he settled in Baltimore, where he again took up a mercantile life. Consult 'Memoir of Tench Tilghman' (Albany 1870).

TILIACEAE, a family of trees, the lindens, with some shrubs and a few herbs, mostly indigenou to the tropics, especially in South America and Asia. A few are natives of the north temperate zone. The chief genus is Tilia, characterized by alternate, simple leaves; solitary or variously grouped axillary flowers with four or five sepals and petals, numerous stamens with two-celled anthers; and several-celled capsules or drupes. One of the most striking peculiarities of the family is the abundance of resinous substances in various parts of the plants, particularly in the young twigs, inner bark and buds. On this account several species are valued for stock-food. Many of the species are noted for their tough fibrous bast, often used for making cordage, bagging and even fine fabric. It hardens in the sun or in the steam in a contempot time, could find a place than that of court fool, the sanction of Nuremberg shoemaker's optimistic social regeneration.

That Hans Sachs should be bor this action at all is enough to it. Lienhard was less concerned for the beauty of his plot than for its atmosphere. I is probable that in Eulenspigel's there should be so sene and resolute a girl as Gertrude, to whom he is sincere voted, it is improbible that his love should not have sufficed to steady him. "stranger of the episode he finds - mean oblivious of Gertrude - a kindred daughter of an innkeeper. But wagerer has carried him from an artful like to the point of realizing this spiritual it seems to see no incongruity in abas the girl to the commonplace lover who has promised to marry, in case she bet. However, neither the plot nor the comedy, of which there is no lack, gives work its chief significance. The moral Eulenspigel is a Diogenes. It is his fault if, in his search for an honest does not even find himself.

WILLIAM G. H.

TILLAGGE. See Agriculture in United States.

TILLETT, Benjamin, English labor b. Bristol, 1859. He was employed in and brickyards from the age of eight; went to sea at 12 and served in the navy two years after he was 17; being then in out of the service. He later became a cooper and in 1887 was one of the of the Tea Cooper's and General Association. He was a large organization of the Dock, Wharf and Laborers' Union of Great Britain; and became its secretary. He was one of the leaders of the Great Dock Strike for many years an alderman of the County Council, and was several times a successful candidate for Parliament as a loyal worker for maximum production of the European War and was one of the members sent to visit the Western Author of 'Trades Unions and', 'History of the London Workers' Strike, 1911 (1912).

TILLETT, Wilbur Fisk, America dist theologian b. Henderson, N. C. 1854. He was graduated from Randolph College in 1877 and from Princeton Seminary in 1880. He held a pastorate in Danville, Va., 1880-82 and has been of systematic theology at Vande since 1884 and since 1884 and vice-chancellor of the University. He has published 'Our Hymns and the Authors' (1899); 'Discussions..."

TILLITE, a rock consisting of a heterogeneous or non-stratified mixture of boulders and sand, supposed to have been glacial till originally. The name was given by Davis to beds in the South African Permian succession believed to have been of glacial origin. Shantum tillite is a member of Roxburg Conglomerate in eastern Massachusetts of Carboniferous, possibly Permian age. See TILL.

TILLMAN, Benjamin Ryan, American legislator: b. Edgefield County, S. C., 11 Aug. 1847; d. Washington, D. C., 13 July 1918. He received his education at Bethany Academy, entered the Confederate army on the outbreak of the Civil War, but was obliged to forego active service owing to a severe illness. The war found him undertaking the management of his mother's farm in the back country, a farmer in spirit and life. During the troubled days of Reconstruction he played his part in the reprisals of the whites. In the '90s a political situation developed in South Carolina, which finally landed Tillman in the governorship. The aftermath of war and the persistence of caste lines put a widening gulf between the aristocrats of the seaboard plain and the back country people of the mountains. With the overturning of the Republican domination the patrician class began to resume once more oligarchic rule of the State. There were mutterings of discontent among the mountaineers and farmers in the backwater districts. As champion of the latter Tillman suddenly found himself thrust forward. In 1890 in the most bitter campaign in the State's history he was elected governor. From the day of his inauguration to the end of his second term South Carolina was a constant ferment. There was one incident of his rule that stands out among all the other turbulent affairs was his promulgation of the famous dispensary law and the events following it. This law gave sheriffs and constables power to enter stores and private houses and to seize any liquors found there which did not bear the stamp of the State. Riots occurred; Tillman ordered out the militia; some companies refusing to obey this summons were publicly degraded, and conditions bordering on anarchy existed, but the law stayed and the governor was triumphant. Tillman soon became a national figure. He took a prominent part in the State Constitutional Convention of 1895, which set an educational qualification for the franchise, and by his violent attitude against the negro he became the object of attack by Northern sentimentalis. He was a bitter opponent of Cleveland; his speeches against the latter gaining him the nickname of "the New York Beak." In the visit of the insurgent conventions of 1896, 1900 and 1904 Tillman was the stormy petrel who raged at all who opposed his views. In 1894 he was elected to the United States Senate and was re-elected in 1900, 1906 and 1912. His terms in the Senate were marked chiefly by the quarrels he had. Cleveland he had hated and it was not in the realm of possibility that he and Roosevelt could be other than enemies and enemies they frankly were during Roosevelt's incumbency of the Presidency. In his later years Tillman became less and less the hugaboo in the eyes of the people who had at first opposed him with all of the bitterness of caste and class. As he broadened into a national figure and in the Senate fought the fight of the whole South with untinged vigor, he was first denigrated, then respected by all the people of his State. The closing years of his life found him chairman of the Senate Committee on Naval Affairs, perhaps the second most important governing body in the country, and as such he worked incessantly for the building up of the navy. He advocated a greater navy, government armor-making plants, etc., and warned manufacturers that the government would force them to stock fairly. He supported his friend, Secretary Daniels, maintaining publicity and private that Daniels was a misunderstanding, much underestimated man who would prove his worth in time.

TILLMAN, Samuel Escue, American soldier and author: b. near Shelbyville, Tenn., 2 Oct. 1847. He was graduated from West Point in 1869, and assigned to frontier duty. In the following year he was called to West Point as assistant professor of chemistry, and was later appointed professor of mineralogy and geology. He continued to teach in the Military Academy for many years, being retired by operation of law on 2 Oct. 1911. In 1874-75 he served as a member of the United States expedition to Tasmania to witness the transit of Venus. He was recalled to active duty on 6 June 1917 and assigned to duty as superintendent of the United States Military Academy. He is the author of 'Essential Principles of Chemistry' (1884); 'Elementary Mineralogy' (1884); 'Elementary Lessons in Heat' (1889); 'Descriptive General Chemistry' (1889); 'Important Minerals and Rocks' (1900), and other textbooks.

TILLODONTIA, a group of extinct mammals, chiefly of the North American Eocene rocks. They were large plantigrade, five-toed land animals, whose skeleton presents characters intermediate between those of Carnivora and Rodentia. The brain is small and slightly furrowed. The dentition was complete and marked by large, rodent-like incisors. A prominent genus was Tillotherium. See Rodentia.

TILLOTSON, t'il"tson, John, English prelate, archbishop of Canterbury: b. Sowerby, Yorkshire, October 1630; d. 22 Nov. 1694. His father, a strict Calvinist, brought up his son in the same principles. He was graduated at Cambridge and elected a Fellow of Pembroke College in 1651. In 1666 appeared his "Rule of Faith," a reply to a work by John Sergeant, an English clergyman, who had made a convert to the Catholic faith. In 1670 he became prebendary of Canterbury. When Charles II, in 1672, issued a declaration of indulgence for the purpose of favoring the Roman Catholics, he preached strongly against it, but was, nevertheless, advanced to the deanship of Canterbury, and three years after (1675) presented to a prebend in Saint Paul's. On the accom-
TILLY — TIMBREL

PLEishment of the revolution he was taken into favor by King William, and in 1689 he was appointed captain of St. Paul's. On the suspension of Archbishop Sanerfoft as a non-juror he was appointed to exercise the archiepiscopal jurisdiction, and in 1691 accepted the archiepiscopal see. He had previously formed an abortive scheme for the comprehension of the Presbyterians within the Church, and had also failed in another design for forming a new book of homilies. When, therefore, he accepted the primacy, a large party assailed him with great animosity. He bore these attacks in silence, and even prevented some prosecutions for libel against him, directed by the Crown. He was also charged with Socinianism; in answer to which he republished four of his sermons on the Incarnation and Divinity of Our Saviour. The only class to whom he did not show a mild and tolerant spirit was the Roman Catholics, toward whom he had a strong aversion. Tillotson's sermons were for half a century the most popular of that class of compositions in the English Church, but have since fallen into neglect and even disuse. In other respects than that of style they are generally commended for benignity of spirit rather than depth or richness of thought. An edition of his sermons was published by his chaplain, Dr. Ralph Barker (14 vols., London 1695-1704). Consult also Birch, Thomas, Life (London 1752).

TILLY, tīl′ (Fr. tê-yé), Johann Tserkaes, Count of, Bavarian commander: b. Castle Tilly, Brabant, near Belgium, February 1559; d. Innsbruck, Bavaria, 30 April 1632. He received a strict Jesuit education, but preferring life in the army he became a soldier of fortune in the service of Span, and later in that of Austria, after which he attached himself permanently to the Bavarian army, and under the banner of its king, the head of the Catholic League, entered upon the Thirty Years' War. His first signal victory was that of White Mountain, 6 Nov. 1620, when he defeated the Protestants in Bohemia. He was victorious over Christian of Brunswick at Hochstr (1622) and Stadthorn (1623), thus gaining the title of Count of the Empire. In 1626 he compelled Christian of Denmark, who had joined the Protestant forces in Saxony, to retire into his own domain. In 1628, as commander of the Imperial army and in 1631 won the famous battle of Magdeburg against Gustavus Augustus of Sweden and the Saxo Protestants. In the following September the Bavarian troops were, however, completely routed by the Swedes at Breitenfeld, and in the engagement upon the river Lech, April 1632, Tilly, who had been victorious in 36 battles in the religious wars of Germany, was mortally wounded. Consult Klop. O. T., Tilly in Preissigiahrigen Kriege (Stuttgart 1801); Villermont, Tilly ou La Guerre de trente ans (Tournay 1859); Wittich, K., Magdeburg, Gustav Adolf und Tilly (Berlin 1874).

TILSIT, Germany, a town in East Prussia, at the mouth of the Memel or Niemen, and the Whehr at its north-east of Königsberg. Its principal buildings are the gymnasium and schools, a theatre, barracks, castle ruins and other institutions. The chief manufactures are iron castings, machinery, paper, soap, candles, coal, chemicals, cloth, leather and tobacco. The ced and salmon fisheries, important, as well as the large stock. At Tilsit the famous peace ending the French-Prussian War was concluded (1815). See WAR, European Pop.

TILTON, Theodore, American jou r, b. New York, 2 Oct. 1835; d. Paris, France, May 1907. He was graduated from the College of New York in 1855 and became a journalist on the New York Daily. In 1856 he joined the editorial staff of Independent, and in 1853 became its editor in chief. In 1871 he became an editor of the Brooklyn Union, but shortly after entered the New York World. In 1874 he caused a sensation in Plymouth Church, Brooklyn, by the Rev. Henry Ward Beecher of the W. a. New York, 2 Oct. 1835; d. Paris, France, May 1907. He was graduated from the College of New York in 1855 and became a journalist on the New York Daily. In 1856 he joined the editorial staff of Independent, and in 1853 became its editor in chief. In 1871 he became an editor of the Brooklyn Union, but shortly after entered the New York World. In 1874 he caused a sensation in Plymouth Church, Brooklyn, by the Rev. Henry Ward Beecher of the Press. He was the author of several poems, including 'The Sexton's Tale and Other Poems' (1867); 'Thou and I' (1880); 'Swabian Sonnets' (1882); 'The Child's Lullaby' (1889); 'The Senate's Last Soul' (1894); 'The Heart's Ease' (1894); and 'The Fading of the Flower: A Poem' (1906).

TIMARU, a New Zealand town on an island in the geographical country, on the coast 100 miles by rail southwest of Christchurch, is an important railroad centre, being at the very junction of the Fairlie line. The principal exports are flour, wool and meats. Timaru has a fine harbor. Pop. 6,424.

TIMBER AND STONE LAW. (June 1878) Congress passed the Timber Stone Law which with certain amendments is now in force. Under this law all unappropriated, unmineral surveyed lands within the public land States are chiefly valuable for the timber or stones and until for cultivation they may be sold at their appraised value of not less than $2.50 per acre. One tract of stone entry may be made for not more than 160 acres (a) by any person who is a citizen of the United States or who has declared his intention to become such citizen, if he is under 21 years of age and has not previously been convicted of any felony; or (b) by an association of such persons to be formed by a corporation of three or more, each of whose stock is so qualified. Provision is made for an appraisement of the value of the stone on the land in question and a lien must be issued in accordance with such appraisal.

TIMBREL, a musical instrument resembling a tambourine (q.v.), has been used in the earliest times. It is mentioned —
TIMBUKTU — TIMBY

made of iron, the idea of which was suggested to him when first he observed the twin-peaked drum of Egypt or the long narm of Provence, to the modern tam-tam of Spain.

BUKUTU tim-buk'too (also spelled Timbuctoo), French Sudan, a trading station situated on the great Niger River, on the southern border of the Sahara, in lat. 16° 43' N., and 57° W. The city lies in a desert region nine miles from the banks of the river feet above sea-level. It measures three circumference, and consists of adobe without windows. In the centre are the mosque, and on the northern outskirts the commerce by caravans the Saharan was formerly enormous, is considerable and again increasing, being at $4,000,000 annually. The trade is silk, fabrics, hardware, ostrich feathers, cotton, tobacco, sugar and gold. Recent on the present Egyptian frontier pointing to a prehistoric foundation, the modern city was founded toward the 11th century, and became known in 1533. Due to its former access Timbuktu was long an obscurer center, the seat of the sultan of the Futa Jalon, who captured the city and adjacent town 1390, deposing the native Songhoy king. At the Moroccon was off, and various tribes controlled the river, the French took possession of it in 1603, and the telegraph line connects with Algeria. The military territory has its headquarters Pop. (1917) about 16,000,000, almost all Negroes. Consult Dubois, 'Timbuctoo, Timbuctoo, Timbuctoo, Timbuctoo' (1905); Lady Luard, 'A Dependency' (London 1905).

BY, Theodore Ruggles, American in-b. Dover, Dutchess County, N. Y., 5 22; d. Brooklyn, N. Y., 1909. He was a shipbuilder, and invented the floating dry dock. Among his other contributions was the latter, iron and steel for coast-defense; a of sighting and firing heavy guns by y, patented in 1862 at Washington, adopted by the United States government and now used in all leading countries; electric turbine wheels; the first portable telephone; the process of printing terrestrial n colors; and a process for quickly coffee. He was the first to advocate the use of iron in the construction of ships; his most famous invention is the z turret which was first introduced in naval Monitor (see Monitor, the and Merrimac), and has since been in naval architecture throughout the world. This invention, through official neglect or refusal to recognize it, has been awarded to John Ericsson (q.v.), given the title of the Monitor. But the true case shows that as early as 1841 exhibited at the War Department a nd plans of a revolving battery, to be

In 1843 he is said to have filed his preliminary specification of the model and plans in the United States Patent Office, and Caleb Cushing the same year sent a duplicate model to China. (See illustration in the Monitor.) The published records of the office reveal patent No. 3,673 sealed to Theodore R. Timby of Cato, N. Y., in 1844 for an improved waterwheel, also patent 4,645, 10 Nov. 1846, for its further improvement, and this is recorded as expired in 1850. On 31 Dec. 1844 a patent was granted to John Ericsson for propelling ships. But there is no record of the revolving floating or coastal battery by either inventor. It is interesting to note, however, that 11 Aug. 1841 a patent was granted to Prosper Martin of Philadelphia, Pa., for floating batteries; and 11 Oct. 1841 to Daniel Fitzgerald, New York, for submarine gunboats. Timby, from 1851 to 1861, is said to have urged the importance of the revolving floating battery on the Erie and Penobscot. Meanwhile, having developed improvements in his invention, the outbreak of the Civil War was his opportunity, and on 8 July 1862 patents Nos. 35,846 and 35,847 were granted to Theodore R. Timby of Worcester, Mass., for (a) revolving battery tower; (b) discharging guns in revolving tower by electricity, and (c) No. 36,593, 30 Sept. 1862 improved revolving battery tower. Incidentally in 1862–63 he received patents for portable warming apparatus; for mercurial barometers; for solar time globe and solar time pieces. The only record of patents to John Ericsson around these dates are three in 1863 comprising (a) instruments for taking soundings; (b) port-stopper for vessels of war; (c) operating gun carriages. Under his revolving battery tower and related patents, Timby entered into an agreement with the builders of the Monitor, including Ericsson as supervising engineer, for its use in the construction of that vessel, and received therefor $5,000. He also received $5,000 royalty for each of the two subsequent vessels built by that company. Although this American inventor received no compensation and no official recognition of his services to the country, his claims were not officially disputed. His invention of the revolving turret, as well as of the "Timby system" of coast-defense adopted by many nations, has been acknowledged by military and naval authorities at home; the legislature of New York passed (1890) a concurrent resolution declaring it to be the "duty of Congress to make such investigation as shall do ample justice to the premises and vindicate the genius that contributed so largely in rescuing the country from a grave peril during the darkest days of its existence"; and influences were brought to bear on Congress and elsewhere to secure full acknowledgment of his patent rights and remuneration for his work from the United States government. Bills to this end were introduced in the national Senate in 1893 by the senators from New York, but apparently without result. An interesting applicable commentary on such conditions may be found in the report of Charles M. Keller, examiner of patents for the year 1844 (Doc. No. 78, p. 507):
It is a matter of surprise that society at large which has been and must continue to be so much benefited by inventions and the progress of the useful arts should pay so little attention to this subject. The fruits of the labors of inventors are enjoyed and recognized by the world at large, but the authors of all these labors go unheeded with impunity, and in most cases unrewarded. It is to be regretted that literary men do not turn their attention to the progress of the useful, and, with the pen of fancy, add ornament and beauty to the solid edifice. Mr. Timby received patents for a mole and tower system of defense (1880); a subterranean system of defense (1881); and a revolving tower and shield system (1884). In his later years he was a resident of Brooklyn, N. Y., where he occupied himself with various literary and other avocations, being especially interested in scientific and philosophical pursuits. Among his writings is a volume entitled 'Lighted Lore for Gentle Folk' (1902), which contains his reflections on a variety of topics. In the 'Country and New York Herald and New York Evening Post, 7 June 1843; 'Harper's Monthly, January 1863, pp. 241–248; 'American Annual Cyclopaedia, 1864; 'Revolving Currents,' pp. 719–723; 'Toddy, or Nuts for Boys to Crack' (1866), p. 166; Parton, 'The People's Book of Biography — Lives of the Most Interesting Persons of All Ages and Countries,' containing a sketch of Timby and an account of his connection with the Monitor; King, 'Theodore R. Timby' (in Successful Americans, January 1902); America Shipbuilder, 23 Oct. 1902; 'A Half-Forgotten Hero'; and Memorial of the Patriotic League of the Revolution to the 57th Congress, presented by Virginia Chandler Titcomb, 1902.

JOHN H. CLIFFORD, C. LEONARD-STUART, Editorial Staff of The Americana.

TIME, that dimension of the world which we express in terms of before and after. Our experience of time is in general analogous with our experiences of space (q.v.), but it has certain important differences from the latter. The difference in this respect is that whereas it is customary for us to think only of the physical order of things in spatial terms, the temporal sequence pervades mind and matter alike. For this reason many philosophers who have treated of space as something secondary and derived have assigned to time a very fundamental status. This has been especially the case among such idealists as Berkeley. In Leibniz's philosophy time appears as the background, so to speak, of the pre-established harmony between the monads, while space is merely the confused conception of their logical relations. Royle, like most of the Absolute disciples of Hegel, holds a view of time which makes it prior to all finite minds, forming their natural environment, as it were, while for the Absolute Experience it is merely a phase of mental content. Bergson considers time the only true dimension of Being, when this is perceived in the truest manner by intuition, as distinct from space as an artificial intellectualization of the intuitive.

These views of the nature of time are opposed to those which assimilate it to space. Kant, for example, makes time the form of the internal sense and space the form of the external sense, and the synthetic unity of apperception always partakes of the nature of space and now partakes of this nature more than ever, for it is considered by the advocates of the theory of relativity (q.v.) that a moving body carries with it a temporal coordinate entirely different from that of the world with reference to which it is at rest and that the true units of both time and space are neither points nor moments, but moments-in-the-history-of-a-point. The grand problem in the philosophy of time consists in the harmonization of these physical theories with the apparent differences between time and space.

The first step toward the closing of this breach is the analysis of our experience of time. This has been done with great care by William James (q.v.) in his 'Principles of Psychology.' He finds that within a definite, limited interval of duration, known as the specious present, there is a direct perception of the temporal relations. After this interval has passed beyond the specious present, it can only enter into consciousness by reproductive memory. As James says, 'The object of memory is only an object imagined in the past to which the emotion of belief adheres.' One might add in the same way that our cognition of the future is only cognition by anticipation and that the object of anticipation is only an object imagined in the future to which the emotion of belief adheres.

We thus see from James' account that our temporal experience is divided into three qualitatively distinct intervals: the remembered past, the perceived specious present and the anticipated future. By means of this tripartite division, we are able to orient our present selves in the temporal stream of our own experience. However, we do not merely have at our disposal the temporal order generated by our present experience, but the memory of the temporal orders of past experiences and the expectation of the temporal orders of future experiences. These temporal orders are themselves subject to a correlation and a temporal arrangement, for two temporal orders not to be remote from each other possess in common certain items by which they may be compared and the order of their specious presents be determined. As a consequence, it is possible to construct a secondary temporal order of the immediately given temporal orders of our experience and it results directly from this that we can construct a temporal arrangement of our specious presents and their contents. We thus see how it is possible for time to have its roots in experience and yet to be a dimension in which experiences and their contents are arranged.

Now, it has been shown in the article on space that the ease with which space undergoes scientific manipulation is due to the fact that the space coordinates the spatial data of our experience which is largely determined by considerations of scientific convenience. As we have just seen, the fact that experiences are arranged in time does not prevent the stuff from time which is made from being of the nature of time. There is consequently no obstacle to a treatment of this material in a manner entirely...
TIME, MEASUREMENT OF

el to the physical treatment of space, or
and other empirical data into a single
rse which is not separable into purely
and purely temporal, all, in the use of the theory of relativity. Of course,
me of science, like the space of science,
construction which is largely arbitrary
or a sense a fiction, but there is reason
ive that the time of the unscientific man,
rgson himself, owes its homogeneity, its
definite direction of flow, its continuity,
e or less unconscious acts of construction
which differ in degree, not in nature, from
the scientist. There is no reason to
that our time data, taken raw, un-
ed, unschematized, indicate of themselves
series into which all events fit in a
er order; indeed, there is good reason to
that the laws which we unquestioningly
ate with time are outlined only in the
way in our definite temporal experi-
fore leaving the subject of the phi-
ly of time, a word or two must be con-
the Zeno and the Bergsonian paradoxes:
ave to do with the flying arrow,
cannot remain where it is, nor be
it not, and with Archiles, 
which is the swiftest of men, cannot catch up
the slow tortoise except by occupying any
of positions, and with other similar
rs. In fact, though these paradoxes seem
al with space and time, they deal with properties of infinite assemblages (see
zilages, GENERAL THEORY OF) and devise
and were in truth unanswerable until
ent thoroughgoing mathematical treat-
of these matters, though they have now
pletely solved. (For a more detailed
ent of these paradoxes see ZENO OF ELEA).
it is only necessary to state that Bergson
ently regards these difficulties as insur-
table on an intellectualistic view of time
hat James turns them to use in proving
ory that time is discontinuous.

ME, MEASUREMENT OF. All our meas-
of time depend primarily upon the motion
earth upon its axis and around the sun.
irst motion enables us to count off the suc-
e days; the other the successive years.
asurement of time thus becomes a most
branch of practical astronomy in
airs of men. It falls into two distinct
, other continuous, the latter to all the
e days or fractions of a day. Other units
me this may be regarded as subsidiary.
ries are determined by the count of years;
s and months by a count of days; hours,
s and seconds by dividing the day into
ons.
he primary object of a measure of time is
xpression or determination of the moment
or date of any event. This is expressed by the
period of time elapsed since some standard
moment or epoch. Long intervals, expressed in
years, are measured from some great epoch,
chased by a nation, and in Christian nations the
birth of Christ is taken for this purpose.
he general subject of measuring or expressing
ong intervals of time is treated in our article
Chronology (q.v.). The present article deals
mainly with fractions of a day, or with what
is commonly called the ‘time of day.’
To express the time of day we must have
a moment at which we consider the day to be
ning and from which we count the hours and
utes. The natural moment for this purpose
is that when the sun crosses the meridian, be-
cause it can be more easily observed than any
other phenomenon growing out of the earth’s
rotation. This moment is actually taken as
the beginning of the day by astronomers on
and, to a large extent, at sea. The latter usage grew out of the fact that
at noon the navigator determines the latitude
of his ship. But, to express the moment of an
event, navigators are now beginning to count
from midnight, as land men have always be-
the Jews formerly considered the day to begin at
sunset and the practice in ancient times was
to divide the 24 hours into two parts, the
day and the night. Each of these parts was divided into
d hours. Thus men had the first, second and
third hour of the night, etc., and the corre-
sponding hours of the day, as we see in the
Bible. Owing to the inequality in the length
of the day at different seasons of the year,
the hours thus employed were of unequal length.
In an age when the modern clock was unknown
and there was no accurate instrument for mea-
suring time in universal use, this inequality was
of little importance. But when an accurate
measure was once obtained, a more uniform
measure of the hours became necessary. For
obvious reasons midnight became the most con-
venient time to begin the day of 24 hours.
Thus arose the system of setting the clocks
at 12 when the sun crosses the meridian, be-
inning a new day 12 hours later when the
clock marks midnight and dividing the
into A.M. and P.M. This system was adopted
without change until the introduction of rail-
ways showed its defects and made a slight
modification necessary.

The first inconvenience felt from the system
arose from the fact that the intervals between
successive noons, as indicated by the passage
of the sun across the meridian, are not equal.
To show the nature and effect of the inequality,
let us suppose a perfect clock so regulated as to
go always at the same rate and to be set at noon
on 1 January of any year at the moment when
the sun crosses the meridian and to be so ex-
actly regulated as to again show noon on 1 Jan-
uary of the year following. It will be found
that, during the month of January, the clock
will continually gain by the sun at a rate of 28
seconds a day at the beginning of the month,
which rate will continually diminish to eight
seconds at the end of the month and will change
to a losing rate about the middle of February.
The effect of the accumulation will be that, at
the latter date, the clock will be found to be
more than 10 minutes ahead of noon when
the sun crosses the meridian. Then it will begin
to fall back for several months until, in May, it will have lost, minutes slower than the sun. Then it will forget itself ahead again fall behind until, when January again comes around, it will once more coincide with the sun.

This inequality between the moments of the sun's successive transits over the meridian is due to two causes, the first by the apparent diurnal motion of the stars, no inequality would be noticeable. The effect of the eccentricity is that the sun seems to move forward among the stars more rapidly in the winter months than in those of summer. And the effect of the obliquity of the ecliptic is a still larger inequality, going through its cycle of changes twice in a year.

So long as an error of modern fractions of an hour was of no importance, people in general had no occasion to trouble themselves with this inequality; but when time had to be measured to a minute, it became intolerable, and the system then had to be introduced. The latter is defined by the going of a perfect clock in the manner already supposed, and so set that, in the average of the whole year, it shall be as much ahead of the sun as behind it. The greatest difference between the clock and the sun will then be about 16 minutes, which difference occurs in one direction early in November, and in the other about the middle of February. The difference is called the equation of time and is given for each day in the house- hold almanac, thus enabling the household clock to be set by the sun. Some such system as this is now used in all civilized countries where exact time is of importance.

Besides true solar time and mean solar time, a species of time of great importance to the astronomer is sidereal time. Sidereal time is measured by the stars, or rather by the daily motion of that point in the equator from which the true right ascension of the stars is reckoned, called the vernal equinox. Dividing the space between the transits of the vernal equinox over the same meridian determine a sidereal day, which is nearly 3 minutes and 36 seconds shorter than a mean solar day, but divided, like it, into 24 hours. About 21 March and 21 September solar time follows the latter an entire day in the year. The sidereal day commences at the instant the vernal equinox makes its upper transit, and, therefore, changes in 12 months through the entire 24 hours. The hours are counted from 0 to 24.

Time may be determined by observations on the sun or stars with a sextant, or an altazimuth for rough purposes, or with a transit adjusted to the meridian, for refined work. With the last instrument a chronograph is frequently used for recording the observations. The telescope usually has from 5 to 11 equidistant lines ruled on glass (or spider lines), which are placed in the common focus of the eye piece and object glass, the centre line being adjusted to the optical axis of the telescope and set in the meridian. When ready for observations, the observer sets the telescope at the proper angle to observe the passage of the star across the meridian, and records on the chronograph the transit over each line, interpreting the transit with an observing key held in the hand and electrically connected with the chronograph, on which a break-circuit of the chronograph is made. The chronograph sheet is read by means of a scale.

A relation which was of little importance in former generations, became very important when railways were run, was that of the relation of time to sun. We readily see that, as the car revolves, the various meridians on which the train is drawn are brought into line with the sun. And of conceiving the case is to think of continually traveling around the earth from west to east. The rate of motion is one in every 15 degrees of longitude. West is true of any other hour or any such hour is about three hours behind the time coming from the Atlantic to the Pacific. The result of a passenger with a good watch to he will find his watch continuing its time at the places he reaches the opposite effect is produced when any conductor could not see their watches every minute is coming east or west, and thus every one adopt some standard of time. There were, therefore, many meridians as railroads, that frequently missed their trains out of what time to go by.

In 1883 was introduced in the United States, which is now used over the entire country, and is rapidly being made in Europe. This system consists in dividing the country into zones by meridians of 15 degrees, or one hour apart. The central meridians of the zones used in the United States and Canada are those of 60 degrees west of the meridian, 75 degrees, 90 degrees, 105 degrees, and 120 degrees, known respectively as the Atlantic, Eastern, Central Mountain, and Pacific. The line dividing one zone from the next are arranged, as nearly as a constant run about midway between these within each zone one and the other.

The result of this system is that a traveler journeys only within a zone finds the time to be everywhere the same when he crosses the line from one zone to the next, the time suddenly changes by one hour in one direction or the other. It should be carefully understood that the system of expressing time, which is throughout almost our entire country actually used is not the true length of time, as indicated by the sun, except at the standard meridians. It does not correspond to the sun's rising, as given in the standard time tables, Cincinnati, for example, is 2 1/2 hours in one direction or the other. The convenience thus arising is very great, if only one determines the passage of the sun across the line or according to his local standard meridian, in order to...

ard time. The inconvenience thus arising is very small compared with the advantages of the uniformity to which the system gives rise. Similar systems are in use in all European countries except Ireland, Holland, Russia and Greece, which retain the time of their capitals, except in the case of the Russian railroads, which take their time from Pulkova. All other European countries take their time from meridians differing by an integral multiple of 15° or 7½° from that of Greenwich. This is in accordance with the method of reckoning time for international purposes, agreed to by the International Conference held at Washington, D. C., in 1883. Universal time is reckoned from mean noon, the day commencing at midnight, and divided into 24 (instead of into two portions of 12) hours each. Local time will still be used for local purposes; but the method of fixing it will be changed. Since the earth is divided into 360° and the day in 24 hours every 15° will represent the difference of an hour in time. If the earth be divided into 24 equal parts, at every 15th meridian, and if the local mean noon of such a meridian be designated as the standard mean time of all places 7½° each side of it, it will follow that when it is noon at Greenwich and at all places within 7½° of Greenwich, it will be 11 o'clock by local (but still noon by universal) time in places between 7½° and 22½° east of Greenwich, and 13 o'clock by local (but still noon by universal) time for all places between 7½° and 22½° east of Greenwich, and so on throughout the world. Universal time will be the same universally, and local time will differ from it only by even hours, instead of by the various odd minutes by which local standards differ from each other at the present time; while in no case will the difference between standard noon and absolute noon at any place exceed half an hour, since a difference of 7½ degrees of longitude equals a difference of half an hour in time.

Time Signals.—Many observatories send out time signals either daily, hourly or sometimes continuously every second, or every other second, to various parts of the country for the purpose of giving accurate time to all sorts of industries. They are sent out over the telegraph lines, the wires being permanently run into the observatories for the purpose, and the signals are generally sent out at the rate of 60 per minute, there being a distributing clock which is kept as near the exact time as possible. An electric current passes through the clock and is broken or closed regularly by a toothed wheel on the second hand of the clock. The best known set of time signals is that sent out by the Naval Observatory at Washington. It is as follows: three or four minutes before noon, whenever the telegraph companies switch in the loops to the observatory, the clock begins to send out make-circuit signals every second over the various lines, the minutes being indicated by leaving out the seconds 55, 56, 57, 58 and 59 in each, and the half minutes by leaving out the 29th second of each. The click following such a one-second gap then always indicates the beginning of a half-minute and the first following a gap of five seconds indicates the beginning of a minute, except at the exact noon. Just before this there is a gap of 10 seconds, and then exactly at noon the circuit closes and remains closed for just a whole second, the beginning of the marks indicating exact noon. The closing of the whole second is a form, which particular mark goes through all the telegraph lines, for this particular signal is made to do a great many things at different places, such as the dropping of time balls, and it is more important that this particular second be distinctly sent than any of the others. At the break of the noon signal the telegraph companies quickly switch out the loops to the observatory, and the lines immediately resume their normal work. In the city of Washington this particular noon signal drops a time ball on the top of the State, War and Navy Department Building, and it also automatically corrects, by setting forward or back exactly to 0 hours 0 minutes 0 seconds, all the clocks in the department. It was made by government, no matter how much they may have gained or lost since the preceding noon.

In recent years an artificial regulation of time consists in arbitrarily setting forward all public clocks by the amount of one hour on the first of May of each year, the hour being again dropped in the month of October. The principal advantage of this proceeding is that during the summer months the time of artificial lighting is lengthened, with a consequent large aggregate saving in expenditure. Up to the year 1916 this regulation had been adopted in England, Germany, France, Austria, Holland, Denmark, Norway, Italy and Portugal. It was adopted as a war measure in the United States in 1918–19, but was repealed in the latter year.

TIMGAD, Algeria, the ancient Roman city Thamugadi, in the department of Constantine, near Lambèze, about 23 miles southeast of Batna on the Philippeville-Biskra Railroad, is approached through a valley bounded by the Aures Mountains and stands on the northern fringe of the African Desert. It was a fortified frontier town at the junction of six roads, and was founded in 100 A.D. by Lucius Munatius Gallus. It flourished for three centuries and then underwent various vicissitudes, owing to native insurrections and the incursions of the Vandals, in 535 being partially destroyed. Four years later, under the Byzantine general Solomon, it was restored and had another period of prosperity until the Arab invasion of 646, when the Christian garrison of Timgad, defeated and killed, the town being subsequently abandoned, falling into ruins and gradually becoming buried beneath the desert sands. Recent excavations undertaken by the French government have revealed ruins, which are beautiful, magnificent and magnificent extent have gained for Timgad the title of the "African Pompeii." Nearly the whole of the city has been laid bare (see illustrations) and exhibits the usual Roman planning, two main streets, the Decumanus Maximus extending east and west and the Cardo Maximus intersecting at right angles, upon and around which the city was built. The principal buildings are on the main streets and among the prominent civic features are the magnificent triumphal arch of Trajan, the Forum (seating 3,500), with the theatre, basilica, library and other buildings surrounding it, the temple of Jupiter Capitolinus, statues of the Roman emperors, a Byzantine fort, the Christian basilica and ca-
TIMOLEON—TIMOR

acted by Gregory, the governor already mentioned, houses and stores, markets and annexes, thermæ and latrine. The arch of Severus and the Roman construction of its kind in northern Africa and the dominating attraction of Timгад, bears an inscription which translated reads:

"The Emperor Caesar Nerva Trajan Augustus Germanus, son of the divine Nerva, sovereign pontiff, four times tribune, three times consular, father of his country, founded the Marcan colony, Trajan of Thamugadi, by the help of the First Augustan Legion, Lucius Munatius Galba being the legal imperial proprietor."

The epigraphic wealth of the city is considerable, including inscriptions to early Christians, showing that they were persecuted and underwent martyrdom, while others bear such historical names as Novatus, a member of the Council of Carthage in 258; Sextus in 320; Faustinius, opponent of Gaudentius the Donatist, in 411, and Secundus, bishop of Numidia, exiled by Hunicus in 484. Consult Bull., A., 'Guide Illustré de Timгад' (Paris 1911).

TIMOLEON, ti'mô-lo'n, Grecian commander and liberator of Sicily; b. Corinth, about 400 to 395 B.C.; d. Syracuse, 337 B.C. He was accused of having caused the death of his brother, Timophaeus, the head of the state, and is said to have exiled himself from Corinth for 20 years in consequence. Little is known of his life until he entered the service of the Greek cities of Sicily in the effort to expel their Carthaginian invaders, an undertaking in which he met with signal success. In 343 he drove Dionysius from Syracuse and in 339, with only 12,000 men, met and conquered a force of 70,000 Carthaginians and allies under Hasdrubal and Hamilcar, at the Crimissus. Thereafter he secured the chief posts which the Carthaginians were confined to the territory east of the Halyceus. In the cities thus freed from their enemy, he restored democratic government, and was looked upon as the defender of their liberties. In Syracuse he restored ancient rights, but gave the citizens a new and yet more liberal constitution. Consult Plutarch's 'Lives.'

TIMON, ti'mon, Athenian misanthrope: b. near Athens. He flourished in the later part of the 5th century B.C., and the ingratitude of his friends so greatly embittered him that he retired into solitude. His name has become proverbial as descriptive of a misanthrope. He formed the subject of a famous dialogue by Lucian and his story is familiar through Shakespeare's tragedy.

TIMON OF ATHENS. Very little has yet been discovered concerning 'Timon of Athens.' There is no record of any early performance or any edition other than the strangely imperfect one in the folio of 1623. On the evidence of style the play is dated about 1607 and thus referred to the same period as the three other tragedies with which it has most in common, 'King Lear,' 'Antony and Cleopatra,' and 'Coriolanus.' It is generally agreed that the best parts of Timon are not only Shakespeare's but must be counted among his highest achievements in poetry,—poetry, as a recent writer has said, 'coming short of 'Lear's' path in the uncertain of dictation and certainly in pathos of situation, but surpassing even 'Lear' or 'Coriolanus' in the sheer force of that emotion which, in different forms, is common to the three plays.' (Wright). On the other hand, many of the un-Shakespearian scenes are of almost unaccountable poorness, by no means justifying Masefield's verdict that they were written by "a man of genius, a skilled writer for the stage, and of a marked personality." The best supported modern view is that something over half the play is by Shakespeare and the rest unattributable to Shakespeare of an unknown reviser. Flesy thought that the Shakespearean fragment was hastily expanded in 1623 for the express purpose of making it fill a gap in the Folio volume, caused by the decision to remove 'Troilus and Cressida' from the number of tragedies. One of the sources is certainly the brief account of Timon in Plutarch's 'Life of Mark Antony,' whence Shakespeare derived most of his material for 'Antony and Cleopatra.' This may have been supplemented by a similar, but much longer narrative in Painter's 'Palace of Pleasure.' The introduction of incidents not found in either of the foregoing works seems to establish the use also of an anonymous earlier Timon play (a comedy), and perhaps a Dialogue of Timon. There are yet unsolved difficulties about explaining how the last two writings became known to Shakespeare, for the Timon comedy seems neither to have been printed in Shakespeare's day nor acted in London, whereas Lucian's dialogue was not accessible in English. In 1678 the Restoration dramatist, Thomas Shadwell, brought out a revision of 'Timon of Athens,' of which he boasted, "I have made it into a play." The claim may be allowed, for Shadwell's play had reasonable success and there exists no positive proof that 'Timon of Athens' had ever been acted previously. A later adaptation, made by Richard Cumberland in 1768, was acted by Garrick in 1771. Cumberland omitted large portions of the original, added the character of Evanthe, Timon's daughter, romanticized that of her lover, Alcibiades, and much lightened the gloom of the play's close. This piece was a failure. Horace Walpole remarked sarcastically that Cumberland's alteration was "wantonly well done, for he has caught the manner and diction of the original so exactly, that I think it is full as bad a play as it was before he corrected it." The best recent discussion of 'Timon of Athens' is by E. H. Wright. ('The Authorship of Timon of Athens,' 1910).

TUCKER BROOK

TIMOR, ti'môr, an island of the Malay Archipelago, the most eastern and largest of the Lesser Sunda Islands, 700 miles southeast of Borneo and 500 miles west by south of Papua or New Guinea; length, 300 miles; width, 60 miles; area, 12,450 square miles. Coasts are steep and generally difficult of access as an account of coral reefs; the island is traversed by a mountain chain everywhere giving evidence of volcanic action; highest point, Mount Atlas, over 12,000 feet; the interior is very little known. The vegetation is less luxuriant and less varied than in the other islands of the East Indies. The coast lands are cultivated to some extent, the northern part of the island being more favorable to agriculture than the southern.

Coffee, rice, sugar and cacao are grown, but mostly for domestic use; some sago is exported, also sandalwood, wax, trepang and
shell. Horses, ponies and cattle are a few exported. There is considerable wealth, but it has not been described. The people are mainly Papuan, with Polynesian and Negrito mixture, with Chinese, who control the trade. Many ople are savage, being classed as head. The island politically is divided between Portugal and Holland, the northern part being Portuguese and the southern part (3,120 square miles) Dutch. Dutch mission was first made by treaty in 1859, boundaries and relationship of the two more exactly defined by another treaty. In 1908 another treaty was ratified and territory exchanged between these states. The Dutch capital is Kupang (pop.), the Portuguese Dili (3,000 pop.), a group of islands of the Malay Peninsula, lying about 300 miles east by north of the island and 150 miles west by south of India, all being southwest of New Britain. The island consists of Yamdena (or Yt), 1,151 square miles in area, Selaru, or dat, Molu and Maro and a number of uninhabited islands, with a total area 2,000 square miles. The larger islands the maximum elevation being 820 feet; 200 are low and flat, of coral formation. are is carried on in a primitive fashion; cattle are raised; turtle fishing is an important, and turtle and are exported. The population is estimated at 20,000, mostly Papuans.

ORTHEUS, Athenian general: b. about the 5th century; d. Chalce in Euboea, 432 B.C. In 378 he was made commander in chief of the Athenian fleet sent out by the Athenian Confederacy to the Peloponnesian coast along the coast of Lacedaemon and of the Spartan fleet in 375. Peace was declared with Sparta, he was recalled to Athens. In 372, having been sent to the island of Samos, and by her acquisition of Sestus and Cratho, the control of the Hellespont was appointed, with Chares the command of an expedition Byzantium, but refusing to engage in a what he deemed an unpromising mission, was accused by Chares of causing the 1 against, and was deposed from power. ORTHUS, ti-mo'the-us, Greek dithyramb poet: d. 357 B.C. He was the most lyric poet of his day. An ancient Greek system of about 100 lines of his 'Nomoi,' said at Abydus, in Egypt, in 1902, is believed to be the oldest Greek writing in existence and is thought to have been copied in the 5th century B.C. It is in the Attic poetic style, originality in metre and the defeat of the Persians at Salamis. He was also renowned in his time, his instrument, the cithara, and his knowledge of harmonic principles. A number of the fragments of his poems are to be found in Bergk's 'Poetae Lyrici Graeci.' Consult also Smyth, H. W., 'Greek Melic Poets' (New York 1900); Wright, W. C., 'Short History of Greek Literature' (New York 1907).

TIMOTHY, a disciple of Saint Paul: b. in Lycaonia, Asia Minor, probably at Lystra, of a Gentile father and Jewish mother. His father's name is unknown; his mother's name is Eunice, his grandmother's Lois. By his mother and grandmother he was early made familiar with the Old Testament Scriptures, and it seems likely that by them also he was first instructed in the Christian faith, which they had probably been won over to on Saint Paul's first missionary visit to Lystra, while Timothy was still very young. When Saint Paul, along with Silas, visited Lystra on his second missionary journey, seven years after the first, Timothy became an active fellow-worker with the apostle, and he accompanied him and Silas in the further course of their mission. Timothy accompanied Paul to Philippi and Berea; but he is not mentioned as being with Paul at Thessalonica, which the apostle visited after Philippi and before Berea. He was then left in the last mentioned city alone, but rejoined Paul at Athens, from which he was sent back to Thessalonica. After remaining there some time he once more joined his master at Corinth. No further mention is made of Timothy till at least five years later, when he is found with Paul at Ephesus on his third missionary journey. Timothy lived along with Erastus into Macedonia and Achaia to prepare the churches in that city for the visit that Paul himself was meditating (Acts xix, 22). Timothy met the apostle again in Macedonia, and was among those who preceded him on his journey to Jerusalem. We lose sight of him for the next two or three years; but he appears at Rome with Paul at the time when the epistles to the Colossians, Philemon and Philemon were written. From the third verse of the first chapter of the first epistle to Timothy we learn that Timothy was on one occasion left at Ephesus when Paul went into Macedonia, and it is supposed that this was after Paul had been released from the confinement in which he was placed when he was sent to Rome from Jerusalem. Tradition makes Timothy the first bishop of Ephesus. He is said to have been martyred in the reign of Domitian or Nerva.

TIMOTHY AND TITUS, Epistles to Pastoral Epistles. The two letters which purport to have been written by the Apostle Paul to his young friend and assistant Timothy and the letter which in the same way purports to have been written to his fellow-worker Titus are commonly called from the nature of their contents the 'Pastoral Epistles.' They sustain so many resemblances to each other that it is simplest and most helpful to treat them as a group, as, indeed, is commonly done.

Arguments as to Paul's Authorship. Before touching on their contents and significance, it is best to take up the much debated problem of their authorship. External evidence in favor of Paul's having written them, consisting of quotations and citations by name, is abundant from the earliest times. It is pointed out, in fact, to Polycarp and Ignatius (before 120), if not to Clement of Rome (95). The one case of rejection, that by Marcion, is plausibly ex-
plained on the ground of antagonism to the doctrines taught. The strong attestation gained them to any considerable ascendency as from Paul down to about the beginning of the last century, but since that time scarcely any point in New Testament criticism has been more constantly and strenuously disputed, and at present there is no point on which critics who deserve consideration are more evenly divided.

(1) The first objection to be noted is that these letters cannot be from Paul's pen because the circumstances implied do not agree with the conditions otherwise known to have existed at any time in the apostle's life. It is admitted on all sides that there is no period described in Acts into which these letters fit, but the latest criticism, under the influence of Harnack, holds that Acts was written before the end of Paul's imprisonment at Rome and, if so, it is as legitimate to hold that he was released as that he was put to death soon after the time reached in the story of Acts. This release is rendered plausible by the facts that there was no charge against him on which he could have been fairly condemned (cf. Acts xxvi, 32); that Paul certainly not only hoped but expected release (Phil. i. 22; Philmon 22); and that he was there when John wrote at Ephesus where exists on the subject is to the effect that he visited Spain as he earlier intended, which would imply release from his first imprisonment. The question of the genuineness of these letters must be considered apart, as this is a question which Pauline authorship is that the vocabulary, the formation of the sentences and the way in which they are related to each other vary irreconcilably from Paul's acknowledged writings. A difference on these points must certainly be recognized, but when we consider the difference in the topics discussed, the lapse of time, which, if not more than five years since the composition of Philippians, might have brought many new circumstances to influence language, and the possible freedom with which Paul's amanuensis may have reproduced what he gave out, it is held by many critics of acuteness and standing that the difference may be harmonized with Pauline authorship. It is true that it has lately been urged that the language and style of the "Pastoral" approach in many points those of Luke and that, as it is said in 2 Timothy that he was Paul's only companion when that letter was written, it is presumable that he put that letter on paper, and if so, almost certainly the other two, a fact which would go far to explain the differences under consideration. It is also to be taken into account that the peculiarities of vocabulary and style are equally, if not more difficult, to explain on the theory that the letters were fabricated in direct imitation of Paul's genuine letters, since such a literary artist would naturally have avoided such striking deviations from Paul's previous usage as are recognized to exist. (3) It is also urged that the doctrinal content of these Epistles is inconsistent with Paul's teaching in other letters, and it should be noted at least in the form of presentation of truth actually exists. But when it is taken into account that the opponents of Pauline authorship commonly hold that these letters were written by a "Paulinist," probably by a disciple who felt that he was merely reproducing his master's ideas, it must also be recognized that no doctrinal contradiction or essential consistency exists between the two sets of teaching. When the variations in presentation of his theological views in the Epistles, as in 1 Corinthians, Romans, and Colossians, are taken into account, it should equally be recognized that in the circumstances presupposed in these Paul might have given the which stands in them. (4) It is also sometimes alleged that the conditions which are implied as existing in the churches, alike as to heresies as to church government, require a later date than can fall in the lifetime of Paul. But answered that the government of the is as by no means so advanced as is asserted, and that there is no ground for supposing that this stage of ecclesiastical development and also such a prevalence of error as is alleged, might have been reached by the year (5) It is also objected that the tone of these letters is more formal and distant than that of the other Epistles, as though these letters were the letters of one in a church; that direction is given to the Ephesians, that on the ground, as is implied in 1 Timothy, when he urges his leaving his work diately, as in 2 Timothy, by which it is ceivable that Paul should have addressed himself to Timothy as a young man, it is argued that the letters, especially 1 and Titus, were in reality "open letters," intended to be read to the churches at hand and Crete; that 1 Timothy and Titus imply that Paul had himself been in Ephesus, that as Timothy might be uncer, delayed in leaving at Paul's request, might well be given to apply in case of hindrance; that it is not unnatural that a man who years before had called him "aged," should still think of Timothy as being a not uncommon characteristic of an elderly man, and that Paul might consider in the next generation more youthful than they were, and that it is by no means unreasonable to hold that Timothy was not only strengthening and heartening of the apostles, these letters, as Paul the strong may have been especially drawn to him by traits which would show as weakness, had to live his own independent life as a leader. It is also to be noted that every one of these points tells as well against the supposition of fabrication, as fabricator would naturally avoid these qualities, and, in particular, would not be able to account for anything which might seem to discreditably upon Timothy.

Critical Conclusion.—So far as contentions are concerned, it may be held that neither side has advanced arguments, but that, while the characteristic letters does not demonstrate Paul's author on the other hand, the letters have not been proved to be by another hand. Perhaps the main criticisms do not accept Pauline authorship for as they now stand find themselves to recognize that many of the historical especially in 2 Timothy, are genuinely historical. Various attempts have been made to s
TIMOTHY — TIMUR

fragments could have been woven into the others otherwise fabricated, but thus far all explanations of such parallels appear to have been futile. It is impossible to determine from any of the literary phenomenon that the work of the Muratorian Fragment was written by St. Timothy, written out of personal interest and regard, and still held in high esteem by the Catholic Church in the arrangement of ecclesiastical discipline.

Occasion and Order of Epistles.—If not the work of St. Timothy, written out of personal interest and regard, and still held in high esteem by the Catholic Church in the arrangement of ecclesiastical discipline.

TIMOQUOMAN FAMILY, a group of American Indians formerly occupying central and northern Florida. In 1527 — when first known to the Spaniards — these Indians had some 50 settlements along the Saint John's River. There were five original tribes speaking as many dialects. Wars of extermination and the inroads of the English from Carolina gradually reduced the tribes in numbers, and they fled to Volusia County, at the headwater of the Saint John's. The territory thus abandoned was afterward occupied by the Seminoles (q.v.).

TIMUR, té-moor, TIMUR BEG, TIMUR LENG, TAMERLANE, the latter a corruption of Timur Leng, "Timur the Lame"). Mongol conqueror: b. Kesh, near Samarcand, about 1336; d. Otrar, 17 Feb. 1405. He was a descendant of Genghis Khan and became chief of his tribe in 1370, having previously reigned jointly for some years with his brother-in-law, Hussain, of whom he became jealous and whom he put to death, after defeating him in a short civil war. He established a firm government in his dominions and then embarked on his career of conquest. He subdued Persia and the whole of central Asia from the Great Wall of China to Moscow, and in 1398 invaded India, which he mastered from the Indus to the mouth of the Ganges. His cruelty knew no bounds. On one occasion, it is recorded, he massacred 100,000 prisoners, while on the banks of the Ganges he was called by the emperor of the East and other princes to aid in repelling the Turks under Bajazet. He wrested Syria from the Mamelukes on his return journey, overran the sultan's dominions with his vast army and on 20 June 1402 met Bajazet on the plain of Angora, routed his immense army and took him prisoner. In 1404 he began preparations for an expedition into China, and early in 1405 began the advance which was stopped by his death. Timur, however, was not a mere barbarian. He was an able administrator, with many statesmanlike traits, a patron of science and art and is also reputed to have been an author, though on dubious evidence. Consult Howorth, "History of the Mongols"; Jean de Bec, "Tambur-
Tin, a white, ductile metal, obtained by smelting tin-stone or cassiterite—so-called from the Cassiterides, islands from which it was first brought into European markets. Tin appears to have been known in the time of Moses; and at a somewhat later period in Jewish history, iron and brass were brought by the ships of Tarshish from the islands east of the Persian Gulf. The Phoenicians traded largely in the tin ores of Cornwall, which was then, as now, celebrated for its mineral wealth. The mountains which separate Galicia from Portugal were also very productive of tin in ancient times, and still continue unexhausted. The mountains between Saxony and Bohemia have been wrought as tin mines for several centuries and still continue productive. Mines of it occur in the Peninsula of Malacca, in India, in Chile, in Mexico, in Peru, etc. Large deposits of tin-stone have been discovered in Queensland, New South Wales and Tasmania.

Tin-stone or tin dioxide (SnO₂) is the only ore used for obtaining metallic tin. Its chemical composition is oxygen 21.4 per cent, tin 78.6 per cent. It is found disseminated throughout the alluvium of valleys or in lode at considerable depths beneath the surface; the former deposits yield what is called stream-tin, while from the latter mine-tin is obtained. The first process to which the ore is subjected is grinding. The ground ore is then washed, which removes the impurities; for the specific gravity is so high that it is easy to wash away the earthy matter, and even some of the foreign metallic ores with which it is often mingled. But there are other bodies so nearly of the same specific gravity of the tin ore that they cannot be thus removed. The ore is then roasted in a reverberatory furnace, whereby most of the sulphur and arsenic are expelled. The ore, thus freed as much as possible from foreign matter, is mixed with from 15 to 20 per cent of its weight of pulverized antracite coal and a small portion of flux, generally lime-stone, and heated strongly in a reverberatory furnace, so as to bring the whole into the state of fusion which is kept up with gradually increasing temperature for about eight hours. The lime unites with the earthy matters still mixed with the ore and flows with them into a liquid slag, while the coal reduces the oxide of tin to the metallic state. The reduced tin falls by its own weight to the bottom, and is, at the end of about eight hours, let out by tapping a hole in the furnace which had been filled with clay.

Refining Process.—The tin thus obtained is still very impure; it contains generally iron, copper, arsenic and fume-sten. In order to purify it the blocks of tin are placed in a reverberatory furnace and moderately heated to the point where the tin melts and flows into the refining basins, while the greater part of the foreign metals remains in the solid state. The molten tin flows slowly stirred with poles of green wood, whence gases are given off, and the metal is maintained in a state of artificial ebullition. The upper parts of the contents of the basin are oxidized and removed from the surface, while the greater part of the foreign metals collects at the bottom. The metal is allowed to partially cool, during which process it separates into zones, the upper consisting of nearly pure tin, while the impure that it must be returned to the furnace and again melted. The upper layer is removed into molds, containing each a three hundredweight, in which it is allowed to solidify; it is then sent into the market as tin, the purest specimens being called raw.

Characteristics.—Tin, when pure, is a fine white color like silver but with a bluish hue, and when newly melted its b has a great. It has a slightly disagreeable and emits a peculiar smell when rubbed. Hardness is between that of gold and of Specific gravity, 7.28. It is very malleable leaf, or tin-foil as it is called, is about one-thousandth part of an inch thick, it might be beaten out into sheets thin again, if such were wanted for purposes of art. Its ductility and lity are much inferior to those of most metals known in early times; a bar of quarter of an inch in diameter will not a greater weight than 254 pounds. Tin is flexible and produces, while bending, a able cracking noise, known as the "cry" it melts at about 460° F. When cooled it may be obtained crystallized in the form of rhombic prism. By washing the surf of mass of tin with warm dilute aqua becomes covered with a number of which, from their unequal action upon give an appearance to the metal somen resembling that of watered silk. After a exposure to the air tin loses its lustre becomes covered with a grayish-black color, but under further alteration. Neither is it sensib to being kept under water. When co 54° below zero it undergoes a to what it is called "gray tin." It is it is very brittle and has lost its properties. When tin is melted in an sel its surface becomes very soon covered a gray powder, which is an oxide of t If the heat be continued the color of y gradually changes, and at last bec

Tin Ores.—These are but two tin ore and tin pyrites, known respectively the technical names of cassiterite and oxide. The first of these occurs crystallized in great variety of forms, which erived from an octahedron with a angle over the apex being 112° the majority of the crystals have, one of a right square prism, with nun mids at each extremity. They occur in twin form, the twin crystals for. The cleavages take place parallel to the face of this prism and with both its di sides of the above-named octahedra. The difficulty. The prisms are sometimes c streaked. Lustre adamantine; color shades of white, gray, yellow, red, or black; streak pale gray, in some somet transparent, and in others opaque; bri ness six to seven, about that of for gravity, 6.96. Tin ore presents it variety of compound or matted cry occurs reniform, rarely in botryoid, and massive, with a granular c.
the individuals being strongly and the fracture uneven. The wood-
Cornish mines is a mere variety of is so-called because of its resem-
cross section of the trunk of a tree, bination, also in beds and veins, in
acentric rings of annual growth. In It also occurs in the beds and al-
lark reddish to brown. The follow-
sits of streams in the form of rolled ins were found in specimens of
...ect wood-tin ore:

ia; and 1,500 tons from all other
All told, 33,000 tons were lode tin—
South Africa and
and the remainder from placer.
The total is 10,870 tons less than ust preceding the war. Incomplete data shows that the output for 1917 is 17,869 tons more than for 1916, in spite
4,600 tons produced in the United States, has increased to 4,600,000 tons in of Bolivia. Although the complete statistics of the gold and silver production for 1917, amounting to 21,000,000 annually, the market, the price of tin rose during 1917—from 44.19 cents per pound in
these figures are to be compared
with an average price of about 44 cents per pound for the years immediately preceding the war. During the first years of the conflict the price fell below 31 cents.

The contribution of the United States to the 1916 total was about 140 short tons, derived almost entirely from Alaska, and chiefly the product of dredges operating in the York district, in the eastern part of the Seward Peninsula. The output of this district was 162 tons of "stream tin" estimated to average 60 per cent of metallic tin. Nearly two-thirds of the whole Alaskan output was sent to Singapore to be smelted and refined. The United States output for 1917 was but 90 tons. Nearly all of the production is from placer workings, the one lode mine worked being the Lost River mine, in Alaska. The other tin producing localities in the United States are in Lander and Humboldt counties, Nevada; the Black Hills in Pennington County, South Dakota; near Lincoln on in North Carolina; near Gaffney, South Carolina; and in the Franklin Mountains, north of El Paso, Texas. In all of these localities the ore is cassiterite. This ore has been found in small quantities also in the Te
coe, Mountain of California, near Corona—a deposit which produced 135 tons of tin in 1890–91; in Virginia, in Rockbridge and Nelson counties; in Washington, at Silver Hill, near Spokane; in Maine, at Winslow, and several other localities; and in New Hampshire, at Jackson. Wood-tin has been found in the gravel bearing gravel of Panther Creek, Idaho; and in the Big Prickly Pear Creek district of Montana. There was in 1916 but one smelter in the United States handling tin ores, the plant of the American Smelting and Refining Com-
pamy at Perth Amboy, N. J. Its capacity is about 14,000 tons of tin per year and it works almost solely upon Bolivian concentrates. Before the war a large percentage of the Bolivian tin concentrates was sent to Germany for smelt-
ing. With the cessation of this service a large smelting plant was built in Chile and another plant erected in the United States.

In 1917 there was imported into the United States for consumption a total of 77,866 short tons of metallic tin, having an aggregate value of $68,603,439. Thus it appears that the United States consumed nearly 57 per cent of the entire world's output of tin for the year.

TIN PLATE, Manufacture of. The manufacture of tin plate was probably begun in Bohemia, about the beginning of the 16th century, and was first attempted in England about 1670. The early crude methods consisted of the simple process of dipping the plates of iron in a vat of molten tin and allowing the surplus metal to drain off. In 1865 Mr. Morewood, of South Wales, England, invented a machine which gave tin plate manufacture its start, greatly reducing the cost of production. At the surface of the pot he placed a pair of steel rods which seized the plate as it came up and rolled off the superfluous tin; thus leaving the coating of the plate smooth and even. Since then many improvements have been made in the methods of manufacture, making the product more serviceable and reducing materially the manufacturing expenses. The modern method is as follows:

After the bars of steel have reached the rolling mill they are first cut into accurate lengths, then placed in the sheet-mill furnace, brought to a cherry-red heat, taken out in pairs and given three or four passes through roughing rolls, each bar being fed through sidewise and rolled singly. After cooling they are again heated, placed one upon the other, and in pairs are again rolled. The doubler then grasps the plates at one end with a pair of large tongs and brings the two ends together. The loose ends are then sorn off square, and the fold is flattened by means of a powerful press, thus making four thicknesses or plates, one end of each being free, the other still forming the bend. The plates are again heated, passed through the roughing rolls, taken by the doubler, opened back to the bend, and once more doubled. The first bend is nipped off when the ends are squared, thus making one free end for each sheet in the pack. This is done to prevent buckling and to insure a perfect finished plate. They are then passed through the fourth time, passed two or three times more through the finishing rolls and are then ready for the picker.

After the sheets have been separated and examined for possible flaws, they are sent to the black picker, where they are immersed in a strong solution of acid and hot water to remove all dirt, after which they are rinsed and allowed to drain. All perfect plates, in order to make them sufficiently soft for general use, are sent to the annealing furnace, which softens the pores and toughens the plate. After being heated there thoroughly for a period of about 12 hours the plates are cooled off and carried to the cold rolls through which they are passed. The resquarer then trims the four edges and re-stacks the plates in the annealing box; they are again annealed and put into the white picker, in which the acid solution is much weaker than in the first bath.

Having been pickled and washed, the plates are placed in water baths; immersed in a bath of melted palm-oil; placed in a pot containing molten tin and lead; and finally dipped into another pot of tin of lower temperature than the previous one. From the tumming pot they are put into the prease pot, the thickness of the coating being determined by the time they remain therein. After which they are cleaned by passing through bran dust. This completes the process and the plates are ready for the market.

According to the census of 1905 there were in the United States 36 establishments in the manufacture of tin plate, $10,813,239 capital and 4,847 persons, wages $2,383,070 for wages and $31,375,714 for material; and having an aggregate output of 35,283,360. The business has increased since, and the present method of forming the production is by boxes. Of the production in 1914 was 20,271,683, 1915 22,437, 1916 26,979,994 and 1917 32,898,597. A tremendous increase, due to war orders, but not maintained unless there is an increase in the production of tin, which is not expected.

TIN WEDDING. See Wedding Versaries.

TINAMOU, a South American bird, the Cryptornis, called "partridge" by South American colonists because of its superficial lilac color. These birds, but structurally occupying a distinct place, the determination of which is one of the tasks of greatly puzzled ornithologists. The view is generally held that they are a very ancient form of birds, which though not to be removed from the Carinata present so much resemblance the Rallidae as to indicate them to be the nearest allies of these birds. Many genera and species are known which are found in South America and two or three forms are found in the northward into Mexico. They vary in size from that of a quail to a guinea hen. Their head is small, neck slender, bill elongated, and plumage close and inconspicuous, usually darkish or bluish, with few ornamental markings. The wings are short and rounded, and the tail short and soft as in some species to absent altogether. Some of them inhabit forest and others more open country, and show little skill or courage in escaping capture. Their flesh is delicious, resembling that of a chicken. They are not common, being eggs, since the shell "looks as if it were lightly burnished metal or glazed porcelaln." This is also true of the many rattle characters of this curious group of birds. Cottrell, "Dictionary of Birds" (New York, 1899) will be found many references to this species.

TINCAL, or TINKAL, a com name for borax (q.v.) in the crude form.

TINCKER, Mary Agnes, American writer. b. Ellsworth, Me., 18 July 1833. Earlier days she spent in a parochial school and from 1873 to 1876 in Italy. Her best known novel is 'Aldin's Niece' (1878); others are 'Tiber' (1881); 'The Jewel in the (1884); 'Aurora' (1885); 'Autumn' (1889).
TINCTURE, in pharmacy, an alcoholic of some medicinal substance, prepared tion, maceration or percolation. It may solution of some chemical element as of some single chemical compound as of iron, or a solution of that part of any oil which will dissolve in the solvent sample, tincture of cinchona bark. Sim- ures are those obtained from a single compound tinctures from many. The (menstrua) are various; pure alcohol, of alcohol and water or of alcohol ric, alcoholic solutions containing am- ete.

DAL, Matthew, English controversial- leer Ferris, in Devonshire, about 1653; Aug. 1733. He was graduated from College, Oxford, in 1653; in 1678 was a Fellow of All Souls' College, and became a Doctor of Civil Law, and of Doctor's Commons. In the James II he turned Roman Catholic, and returned to the Church of England. ished several pieces, political and theo- am, which were, 'A Letter to the men of the two Universities, on the sub- he Trinity and Athanasian Creed,' and c, 'The Rights of the Christian Church againstPriests' (1706). This work a sensation among the high church who attacked it with great vigor. Tindal d two defenses of it, which the House nones ordered to be burned by the comm- man, with the original treatise. In published his 'Christianity as Old as tion, or the Gospel a Republication of the of Nature,' in which his object was that there cannot be any revelation from the internal revelation of the law e in the hearts of mankind. This de- rationalist work — by which his name y known — received a great many

DALL, or TYNDALE, William, Eng- er and translator of the Bible: b.ish borders, about 1490; d. Vilvoorden, Aug. 1536. He entered the Univers- 1510, and was graduated in 1518 subsequently went to Cambridge, resided till 1521, and about this latter ame tutor to the children of Sir John a landed gentleman in Gloucestershire. ched with great acceptance in the neigh- but soon got into trouble owing to his b views. In 1523 he went to London, came under the influence of Luther's It was at this time that he began his translation of the New Testament, but had safe to carry out such a work in Eng- went to Hamburg in 1524, and imme- erward to Luther at Wittenberg, where ined till April 1525. During this time cceeding with his translation, with the c of old William Roy, and the printing s begun at Cologne in 1525. A Roman clergyman, John Cochlaus, came to this, and obtained an injunction order- stoppage of the work, whereupon Tint- tions and had the work printed he was smuggled into England in 1526, once Archbishop Warham and Bishop took the lead in seizing and burning Attempts were also made to get hold of Tindall, but he fled to Marburg, where he enjoyed the protection of the landgrave of Hesse. Here he became a Zwinglian in his attitude on the Eucharist, and published some of his most important original works, including 'The Parable of the Wicked Mammon' (1528); 'The Obedience of a Christian Man' and 'How Christian Rulers Ought to Govern' (1529), and 'The Pratyche of Prelates' (1530). He also engaged in a vigorous polemic with Sir Thomas More. From Marburg he went to the Netherlands, and for several years resided in Antwerp, but toward 1533 left the city for a time, owing to Henry VIII's efforts to seize him. In 1535 he was captured at Antwerp by the imperial officers, assisted by an English Roman Catholic student named Phillips who promised to adopt his reforming opinions. He was lodged in the state prison at Vilvoorden, near Brussels, and despite some efforts to save him, made by Cromwell and others, he was tried for heresy, condemned, degraded from holy orders, then strangled and his body burned. A fragment of the interrupted Cologne print of his New Testament translation is in the British Museum, and there are two extant copies of the first edition of his complete New Testa- 1525), one (practically complete) at Baptist College, Bristol, the other (incomplete) in Saint Paul's Cathedral. A revised edition was issued by him at Antwerp in 1534, and a further revision in the following year. His translation of the Pentateuch appeared at Mar- burg in 1529-30, and that of Jonah at Antwerp in 1531; a copy of each is in the British Mu- seum. Tindall's translation is of much importance in the history of the English style and English literature, and formed the basis, as far as it went, of the Authorized Version of nearly a century later. There is an edition of Tindall's original works by the Parker Society (3 vols., 1848-50). Consult Deems, 'Life of William Tindall' (1886); Price, I. M., 'Ancestry of Our English Bible' (Phila. 1907).

TINDER, a dry substance that readily ignites from a spark; before the introduction of friction matches, it was in common use as a means of starting a fire. It consisted usually of charred linen which caught the spark from a flint and steel; since the tinder did not flame, the fire was started by touching a match dipped in sulphur to the ignited tinder. Tinder-boxes were boxes in which tinder was kept ready for use; they were usually provided with a flint and steel, the latter often fastened to the cover of the box in such a manner that the flint when struck against it sent sparks into the tinder within. German tinder* or amadou consisted of the more solid portions of certain fungi, mainly tree-growing polyopes, prepared by boiling in water and drying. Sometimes saltpetre, or even a little gunpowder, was added. Amadou has been used to stop bleeding and also in surgery as a support and for pressure and protection. Spanish tinder* was a stuff prepared from the pubescence of the flowerheads, stems and leaves of globe thistles. The use of the word tinder has been extended to denote any substance easily inflammable.

TINEIDÆ, a family of moths, prominently represented by several small species whose caterpillars are destructive to woolen fabrics, furs and various stored products. See CLOTHES-
TILEY, Katherine, American theosophist: b. Newburyport, Mass., 6 July 1852. She married P. B. Tingley in 1889. She was for some years an assistant to W. Q. Judge, who with H. P. Blavatsky were active in establishing theosophy as a philosophy and religion and on his death she founded, 18 Feb. 1898, a new branch called the Universal Brotherhood and Theosophical Society, which has branches in many cities and countries and headquarters at Point Loma, Cal. She has edited Century Path for a number of years and has written ‘The Mysteries of the Heart Doctrine’ (1902); ‘Nosegay of Everlastings’ (1913); ‘Theosophy and Some of the Vital Problems of the Day’ (1915). See Theosophy.

TINOCERAS, ti-nōs-e-ras, a genus of mammals now extinct, found in the Eocene of Wyoming (Bridge beds) and representing the order Dinocerata. The individuals were all large, some of them nearly equaling the elephants and differing little from, if, indeed, they were not identical with, Uintatherium.

TINOS, tēnōs, or TENOS, tēnōs, Greece. An island in the monarchy of the Cyclades, immediately south of Andros. It is 18 miles long by eight miles broad and has an area of 81 square miles. It is traversed by high mountains, the terraced slopes of which yield wine, wheat, mohns, figs. Marble and silk goods are the chief exports. Tenos or Hagios Nikolas, the chief town, on the south coast, is the see of a Roman Catholic bishop, has two Roman Catholic churches and a small harbor. North of the town is the white marble church of Penagia Evangelistria, a famous pilgrim resort. Excavations in 1902 on the site of ancient Tenos revealed remains of the temple of Poseidon. Tenos was prominent in the wars with the Persians and during the Greek Revolution 1821–27. Pop. 12,000.

TINTERN ABBEY, England, a ruin of unrivaled beauty in Monmouthshire, on the Wye, eight miles south of Monmouth. It was founded in 1131 by the Cistercian monks—the church in 1287. It was once the most important of the Augustinian houses and served as the source of the translation from Early English to the Decorated. The open work of the windows is one of its chief beauties. Under Henry VIII the abbey was dismantled and its lands bestowed upon the earl of Worcester.

TINTERN ABBEY. ’Lines Composed a Few Miles above Tintern Abbey, on Revisiting the Banks of the Wye during a Tour, July 13, 1798’ a reflective poem in 159 lines of blank verse, by William Wordsworth, was composed in 1798, and was published that same year in the foregoing volume entitled ‘Lyrical Ballads.’ The clumsy title has long since been shortened by the public to ‘Tintern Abbey’—in itself misleading, since the poem has nothing to do with the abbey, which is used simply to identify the landscape that serves as a basis for the poet’s reflections. Wordsworth had visited the region alone and on foot in 1793; upon his second visit, five years later, he recalls the first and compares his feeling for nature at that time with what it is now. His theme in general is the inter-relation between nature and the spirit of man, each as an interpreter and revealer of the other: the contemplation of nature gives an insight into the invisible world that comprehends both nature and man; nature has the power to enlighten the mystery of human life; the consciousness and sustain; man’s own emotional experiences, in turn, reveal to him both thought and style are Wordsworth’s great poems; each complements the other; taken together they form the locus classicus of the Wordsworthian faith and doctrine. Platonism that informs the Ode, less fundamental to ‘Tintern Abbey,’ yet the latter throughout.

The poet distinguishes three periods in his attitude toward nature: his boyhood, merely animal delight, grows into a rousing appreciation of natural beauty, and in turn finally develops into a moral and contemplative attitude and brings the “philosophical mind” that identifies nature, man and God (compare ‘The Prelude,’ Book VIII, 340–356). Perhaps none of the ideas in the poem, taken singly, was new to the world; certainly never before had they been fused into a whole and stated with such impressive and splendid as the utterance of one great personality. The style of the poem, though, is a perfect expression of his own, and the theme is Wordsworth’s “grand manner,” as in ‘Ode,’ no less appropriate and perfect a way than the beautiful simplicity of his ‘chapel’ (q.v.). No other of his poems contains so many of his most felicitous lines, such as ‘the still, sad music of humanity’; ‘the little, nameless, unremembered acts of kindness and of love’; ‘nature never did betray the heart that loved her.’

Its faith in the entire beneficence of man is of course the obvious weakness of the poem considered philosophically. How far 19th century theories of human nature, which cannot be discussed here, must have affected Wordsworth’s failure to see other side of nature, by his lack of vision. Here he speaks simply as a seer, the passage in which he declares his sense of God’s love which the shining words of suns is perhaps as moving and sublime as in the whole range of English poetry, as incomparable, at least in style, as anything in Shakespeare or Shelley. Whether considered as self-revealing utterance of a great person or as the statement of a doctrine that has immensely influenced the course of modern thought, or simply as an example of magnificent imagination, ‘Tintern Abbey’ has a permanent place among the supreme achievements of English poetry.

MARION TUCKER

TINTORETTO, tén-tō-ret’tō, Jacopo, busti, son of a dyer (Italian, tintore) who was his usual surname, Italian painter: b. Venice, Sept. 1518; d. there, 31 May 1594. He was pupil of Titian, but was soon dismissed by master, perhaps through fear of rivalry. Thereupon worked without a master, taking

TINWORTH.—TIPPOO SAHIB

TIPPECANOE, Battle of, fought 7 Nov. 1811 near the site of the present village of Battle Ground, on the Tippecanoe River, in Tippecanoe County, Ind., by about 900 Americans under William Henry Harrison (q.v.), who was then governor of the Territory of Indiana and a force of Indians nominally under "the Prophet," brother of Tecumseh (q.v.), but actually commanded by three chiefs, Stone Eater, White Loon and Winnebago. The Indians were estimated by Harrison at about 6,000, but were probably much less in number. Harrison encamped on the night of 6 November near the Indian village on the Tippecanoe River and while his men were asleep in the early morning of the 7th the Indians fell upon them with great fury and were only defeated and driven from the field after several hours of desperate fighting, in which the whites lost about 185 in killed and wounded, the loss of the Indians being unknown, though they left 40 dead on the field. The village was found on the 8th deserted and was burned by Harrison's men. For reasons of prudence Harrison then fell back to Vincennes. Consult Pitrle, 'The Battle of Tippecanoe' (1900), No. 15 of the "Filson Club Publications."

TIPPERARY, tip-ér-ár'i, Ireland, a town and the county-seat of the famous county of Tipperary in Munster. The town is situated 42 miles northwest of Cork and 110 miles southwest of Dublin. It has a large grammar school, several religious schools and butter and provision markets.

TIPPLE, Ezra Squier, American Methodist Episcopal clergyman: b. Camden, N. Y., 23 Jan. 1801. He was graduated at Syracuse University in 1834, took his Ph.D. there in 1836 and was graduated at Drew Theological Seminary in 1837. He served as a pastor in New York in 1837–1805, when he became professor of practical theology at Drew Theological Seminary. Since 1912 he has been president of that institution. He is a trustee of Syracuse University and is author of 'The Heart of Asbury's Journal' (1905); 'The Life of Freeborn Garrettson' (1917); and Francis Asbury (1916); 'The Drew Theological Seminary, 1867–1917' (1917), etc.

TIPPOO (or TIPU) SAHIB, ti-poo' sâ-hib, sultan of Mysore: b. 19 Nov. 1749; d. Seringapatam, Mysore, 4 May 1799. He was the son of Hyder Ali Khan, whom he succeeded in 1782. During the operations of the English troops under General Mathews in Malabar, he checked the advance of the British at Bednore, April 1783 and temporarily wrested Mangalore from its western invaders. In the following autumn he was compelled to surrender this province to Great Britain. In 1784 he was forced to sign a treaty of peace; but, continuing to intrigue, war was declared against him in 1790 and in 1791 he was defeated by Lord Cornwallis and obliged to surrender half of his domain and to pay 33,000,000 rupees to his English conquerors. In 1799 he was suspected of an alliance with Tipoo Sultan of Mysore, was defeated by the British and their allies, the Mahrattas. He was killed while fighting in this campaign. Consult Bowring, 'Haider Ali and Tipu Sultan' (1839).
TIPTON — TISCHBEIN

TIPTON, England, town in Staffordshire, situated six miles northwest of Birmingham. It has coal and iron mines, iron foundries, steam boiler and structural iron works, red and white-lead factories, cement works and brickyards. Pop. about 32,000.

TIPULIDÆ, the family of craneflies (q.v.).

TIRABOSCHI, tê-râ-bô'schê, Girolamo, Italian literary historian; b. Bergamo, 28 Dec. 1711; d. Modena, 3 July 1794. He was educated by the Jesuits, afterward joining their order and was for many years a professor in the University of Milan. He was a scholar of note, his greatest work being the 'Storia della Letteratura Italiana' (1772-83) in 13 volumes. He also published 'Biblioteca Modenesa' (6 vols., 1781-86), and 'Mемориал storiche modenese' (1793-94). He was librarian to Francis III, duke of Modena, from 1770.

TIRAILLEUR, tê-râ-l'yêr, a skirmisher, sharpshooter; the title was first employed by the French, in 1792, to denote light-armed troops thrown out from the main body to do skirmish work, feel the enemy, cover the movement of the main body, etc.

TIRASPOL, tê-râs'pol, Russia, a river-port in the government of Chernov, on the Dniester, 60 miles northwest of Odessa. It possesses five churches, two synagogues and a state bank. One of its chief attractions is its gardens. The principal industries are tobacco-raising and fruit culture. There are four factories and some trade is carried on.

TIRE, the outer hand placed around the fel lows of a wheel, made in various forms, for several purposes. The common tire for a wooden-carriage wheel is made of iron or steel and serves the double purpose of holding together the parts of the wheel and resisting wear in traversing the ground. The continuous steel tire is an American invention and consists of a flat hoop of steel usually of the same width and formed so as to fit tightly over the fellows; it is expanded by heating and put on in a heated condition; upon cooling it shrinks and tightly compresses the wheel. It is further secured by sunk-bolts through the fellows. The wire wheel made on a suspension principle, as in the bicycle, has a steel felloe with a concave outer surface for holding a rubber tire or a pneumatic tire. These have been highly developed in the bicycle (q.v.) and the automobile (q.v.); car wheels and locomotive wheels of cast iron or cast steel have usually tires of tough wrought steel shrunk on, so that the wearing surface may be as durable as possible. See Rumage Tire.

TIREBUCK, William Edwards, English novelist; b. Liverpool, 1854. He was for some years a writer on the staff of the Liverpool Mail and the Yorkshire Post, but in 1888 retired from newspaper life and devoted himself to writing fiction. His best-known novels include 'Summer's Eve' (1883); 'Horrid Missy' and 'Miss Grace of All Souls' (1895). He is also the author of an estimate of Dante Gabriel Rossetti (1882) and of a later work entitled 'Great Minds in Art' (1888), etc.

TIRESIAS, tê-rê-si-as, according to Greek mythology, a soothsayer of Thebes, reputed to have been struck blind either because he revealed to men things which they ought not to know, or because he had been by Athene conferred upon him the power to understand the language of birds, while Zeus bestowed upon him the gift of prophecy and long life. Tiresias has a poem on the subject of Tiresias (1885), who also figures in many Greek legends.

TIREMONT (Flemish, 'Tirment or Tirman'), Belgium, town in the province of Brabant on the Geete River. 11 miles southeast of Liége and 20 miles east of Brussels. There are two churches dating from the 12th c. Notre Dame de Laus and that of Sainmain. Saint Germain has a fine altar by Wappers. The town was taken by Marlborough in 1703; on 16 March 1815, was the scene of a victory by the French over the Austrians, and in the European War it was occupied by the Germans soon after the breaking of the war in 1914, remaining in German hands until the armistice. Industries include brewing and the manufacture of woolens, soap and engines. Pop. 17,581.

TIRPITZ, Alfred von, German admiral; Kuswitz, 1849. Graduating from the Academy when only 12 years of age, advanced rapidly, and in 1896 was State Secretary of the Navy and in 1898 Minister of State of Prussia. In 1911 came his promotion to post of Lord High Admiral. He took a great interest in the development of the submarine and had immense faith in this arm of the sea. He is credited with having organized the submarine blockade of the British Isles in 1915-16. When he carried his idea to the extent of sinking unarmed vessels, participating in the torpedoing of the Lusitania, he aroused such indignation in neutral circles that the unwisdom of the policy was apparent and his resignation was arranged although the assigned reason was his ill health. See War, Eternal.

TIRYNs, tê rin's, Greece, in Argolis, miles southeast of Mycenae, an ancient city a rocky height which formed the Acrope beneath which another city extended down the plain. The town was destroyed 400 B.C. Much of the citadel and of the acropolis with their pointed gates are still standing, together with some interior passages or galleys of similar construction. The excavations conducted by Schliemann in 1874-85 resulted in the discovery of a magnificent palace, comprising various buildings and approached in style. The complete arrangement of halls and private apartments is apparent, and the like Schliemann, 'Tiryns' (1885); Perrot and Chipiez, 'Histoire de l'Art dans l'Antiquité' (Vol. VI, 1894) and Baedeker's 'Greece.'

TISCHBEIN, tish-bén, Johann F. August, German painter; b. Maastricht, 1812. He studied with J. Heinrich Tischbein and in Paris and after serving as court painter in Wurtemberg became director of the Kupferstich Acad. 1810. He painted many noteworthy works, including nine of the princes and princes of Orange-Nassau (Amsterdam) and Schiller, which he finished in 1804.

TISCHBEIN, Johann H., German painter; b. Haina, 3 Oct. 1722, d. 1779.
TISSHANDER, Tisserand

French aeronaut: b. Paris, France, 21 Nov. 1843. He was the inventor of a dirigible balloon in which he made an ascent of five and one-third miles, from Paris in 1875; he alone surviving of the members of the aeronautic experiment. Besides his written contributions to the subject of aeronautics he has contributed to the Library of Wonders series, well-known volumes on the subjects of light, water, coal and fossils.

Tisserand, François Félix, French astronomer: b. Nuits-Saint-Georges, Côte-d'Or, 15 Jan. 1845; d. Paris, 20 Oct. 1896. He was educated at the Ecole Normale Supérieure and in 1866 became adjunct professor at the Paris Observatory. He took his doctor's degree in 1868 with a thesis which was a brilliant extension of the scope of the method of Delaunay. He went to Malacca to observe the solar eclipse of 18 Aug. 1868 and in 1873 became director of the Observatory at Toulouse. He was a member of the French expeditions observing the transit of Venus, in Japan, in 1874 and in Martinique in 1882. He was elected to the Academy of Sciences in 1878; in 1883 became professor of celestial mechanics at the Sorbonne; and in 1882 was appointed director of the Paris Observatory. He made many valuable investigations in the field of celestial mechanics and wrote brilliantly on the subject. The results of his own labors and that of others in this field are presented in his mastery and simplicity in his Traité de mécanique céleste (4 vols., 1886-96). He revised Lalande's catalogue and was editor of the Bulletin Astronomique.

The results of his own labors and that of others in this field are presented in his 'Traité de mécanique céleste' (4 vols., 1886-96). He revised Lalande's catalogue and was editor of the Bulletin Astronomique.
TISSOT, tê-sô, Claude Joseph, French philosopher: b. Fours (Doubs), 26 Nov. 1801; d. Dijon, 7 Oct. 1870. He translated the larger part of Kant's writings into French. Among his original works are 'Of the Beautiful, Especially in Literature' (1830); 'Short History of Philosophy' (1840); 'The Mania of Suicide and of Revolt' (1840); 'Parcelling of the Land and Division of Property' (1842); 'Principles of Morality' (1860); 'Catholicism and Public Instruction' (1874); 'Insanity Considered Especially in Its Relations to Normal Psychology' (1876).

TISSOT, James, French painter: b. Nantes, 15 Oct. 1836; d. Abbey of Bouillon, 8 Aug. 1902. He was a pupil of Ingres, studied in London under Seymour Haden, and attracted attention by his brilliant pictures of fashionable women, actresses and grissettes, as in his 'Promenade in the Snow' (1859). His series of etchings 'Parisian Women' was very popular. He suddenly changed his whole artistic aim in life under the stress of a sudden bereavement and went to Palestine (1860) where he lived nine years with the youth and rural activities of the Holy Land for the purpose of producing a set of pictures illustrating the life of Christ. These paintings were subsequently reproduced by Lecommetier in Paris under the title 'La vie de notre Seigneur Jesus-Christ'; and a parallel publication of them has been issued in this country. The original drawings and paintings, 540 in all, are now in the Brooklyn Institute of Art. Just before his death he began his paintings illustrating the Old Testament.

TISSUE, in biology, a group of similar cells in an animal body (or a plant) which form a definite fabric, having the same origin and discharging the same function. Tissues are classified according to their structure when completely developed, in accordance with their functions, or with reference to their mode or origin. A common classification of animal tissues includes cellular tissue, connective tissue (q.v.), epithelial tissue, (see EPITHELIUM), circular system, (see VESSELS), skeletal system, (see BONE), cartilage, (see HISTOLOGY); parenchyma.

TISZA, i-tzo-, Stephen, Count, Hungarian man: b. Budapest, 1861; d. 31 Oct. 1916. He was educated in Leipzig, Heidelberg and Vienna and was app. to a post in the Hungarian Ministry the Interior in 1882. He was elected the Hungarian Parliament in 1886, became a strong of close relations with Austria. He was premier and Minister of the Interior in 188, losing his seat in Parliament at 41; time that his ministry fell. He was appointed Premier 10 June 1913, and that office at the outbreak of the World War in 1914. He was thoroughly in sympathy with the war and was regarded as one of the chief authors. Growing dissatisfaction with the continuation of the war, and over the demands for suffrage and other reforms, Tisza was unwilling to grant resulted in bringing about the fall of his Cabinet in 1917 and he resigned 13 May 1917. In 1918 he was assassinated.

TITANIA, according to Ovid, a Nymph, a daughter of the Titan Atlas. Shakespeare in 'Midsummer Night's Dream' gives the name to the wife of Oberon.

TITANIFEROUS IRON Ores, chiefly varieties of the minerals ilmenite and magnetite. Ilmenite (q.v.) is called titanite ore and is richer in titanium than either of the others. The valuable ores for both iron and titanium, which has been questioned, seems at least to be established. The remarkable attraction of titanium for iron suggests its use in freeing iron from blow-beds, while titanium steel is a possess remarkable toughness and strength. Much excellent work has been done by Ross in pointing out the merits of titanium steel and in developing processes for the extraction of titaniferous iron oxide. The important known occurrences of titanium, in Norway, Quebec and the Adiron -dents, in each of which regions there are of vast extent. These occurrences are exhaustively described in papers by and J. F. Kennedy.

TITANITE, a mineral occurring in clinohumite, often wedge-shaped and
the composition of calcium silico-titanium is adamantine to resinous; hard to 5.5; specific gravity about 3.5. Partly common, while prismatic cleavages are seen in the variety from black crystals, sometimes bev- 
ed in diameter, occur mostly in lime- 
$n$ Saint Lawrence County, New York, 
Canada. The variety sapphire is usually 
green or golden yellow, and often occurs as or chlorite chalcedony in transparent or 
vent twin crystals. Owing to the high 
ve and dispersive power of such crystals, 
rare beauty and inferior to none but the 
d in their play of colors, may be cut 
lem, though they lack durability owing 
low degree of hardness. The finest of 
em sapphires are from Switzerland, the 
Delaware County, Pennsylvania and 
ober, New York.

**'ANTS, ti'onz, in Greek mythology, six 
$\text{i}$ a six daughters of Uranus and Ge, 
Oceania, Koius, Kretus, Hyperion, and Kromius; Theia, Rhea, Themis, 
syne, Phebe and Tethys. Uranus hav-
ished to Tartarus the Hekatoncheires 
undred-handed') and the Cyclops, Gaia 
the Titans to avenge his brothers, 
ise and freed them, deposed Uranus, and 
nus in his place. Kronus and the Titans 
their turn put down by the sons of 
and Rhea, named the Olympi, with Zeus 
head, but not till after a long struggle, 
Zeus brought to him the aid of the Cyclops 
hekatoncheires, whom Kronus had given 
ad in Tartarus. Zeus quelled the Titans 
é lightning given him by the Cyclops, 
them to Tartarus, placing them under 
$\text{e}$ of the Hekatoncheires. This struggle, 
the titans, was regarded as sym-
: the conflict of reason and order with 
forces of nature. Consult Mayer, 
gante und Titanen in der antiken Sage 
(1887).

**CHENER, tich'en-er, Edward Brad-
American psychologist; b. Chichester, 
11 Jan. 1807. He was graduated from 
in 1890, and afterward studied in Leip-
gamas to Oxford as extension lec-
nals, but was called to Cornell 
ity, Ithaca, N. Y., in 1892, as assistant 
$\text{r}$ of psychology, and in 1895 became 
$\text{e}$ ofessor of psychology there. His writ-
lude (A Primer of Psychology) (1898); 
mental Psychology (1901); Text 
of Psychology (1910); A Beginner's 
y (1915). He is also editor of the 
Journal of Psychology.

**E, Sir William, British architect; b. 
Feb. 1708; d. 23 April 1873. He 
in the work of rebuilding the body of 
unstan-in-the-East in 1817-20; was en-
hanced to the office of Surveyor General 
in 1827-28; and was one of the de-
Loudon and Westminster Bank, 
Lothbury, in 1838. He rebuilt the Royal 
Exchange in 1841-44, a work which is considered 
his greatest achievement as an architect. He 
designed the earlier English railways stations as 
well as those on the line from London to Paris, 
France. He planned the Woking Cemetery in 
1853-54; was a member of Parliament from 
1855 until his death; and was knighted in 1869. 
Author of 'A Catalogue and Description of the Antiquities Found in the Excavations for the Royal Exchange' (1848).

**TITHES, taxes, either voluntary or com-
pulsory, consisting of one-tenth of the income 
taxed. Usually tithes were one-tenth of the 
annual profit of the land and were paid for 
purposes of church support. The custom is of 
extreme antiquity. In Genesis xiv, 20, Abra-
ham allows a tenth of the spoils taken from 
four kings to their victor. Moses allowed 
tithes for the support of the Levites and for 
service in the temple (Lev. xxvii, and Num. 
xxix). In 778 Charlemagne commanded tithes to be collected within all the provinces of the 
old Roman empire over which he ruled; this 
was for the support of the Christian Church. 
These tithes were by him allotted to four dif-
ferent uses: one part was for the maintenance 
of the edifice of the church, and the other 
third, severally, for the support of the bishop, the 
clergy and the poor. Ecclesiastical tithes were 
always more or less oppressive in their opera-
tion, being unevenly imposed, but after their 
introduction into Great Britain they were 
systematized. They were first enjoined in 
England in 786 and in 794. Offa, king of 
Mercia, gave the Church all the tithes of his 
kingdom, and this law was subsequently 
made general for all England by Ethelwulf. 
When dioceses were divided into 
parishes the tithes of each parish were allotted 
to its minister, at first by common consent, 
but afterward, about 1200, by the law of the land 
in England. The custom of paying tithes 
became established in Germany and France about 
the same time, the 9th century, and in the 
Scandinavian countries in the 11th century. 
At first the payment of the tax was always 
kind, that is, in grain, livestock, wool, etc., and 
such tithes were known under the heads, 
namely, prudial, or those which arise 
immEDIATELY from the soil, as grain, fruits 
and wood; mixed, or those consisting of natural 
products but nurtured by the care of man, as 
calves, lambs, eggs, cheeses, wool, etc.; 
and personal, or those arising from the profits of 
personal industry as in the pursuit of some 
profession, or some trade of livelihood. With 
regard to their value tithes were divided into 
great and small; great tithes being grain and 
wood, and belonging to the rector, and small 
tithes being the other prudial tithes with 
the mixed and the personal tithes, and belonging 
to the vicar.

Tithes proved a source of great trouble in 
every country in which they were collected and 
insufficient idea of how often they were 
ripped in the church and the people. They 
have, therefore, been abandoned in nearly all countries except England, where they are still retained. There they have 
been the cause of constant friction between 
the people on the one hand and the officers of 
the law and the clergy on the other. Under 
Henry VIII, the owners of certain great estates
were relieved of the duty and this increased the feeling of the tithe-payers that their burden was too great. In three-fourths of Ireland it was found impossible to collect tithes, for long periods at a time, and the enforcement of the law, especially in cases of non-members of the Church, was not infrequently accompanied by violence. As a result, the practice of collecting the tithes by the clergy was replaced by a system of annual assessment, which was more convenient and more acceptable to the people. The matter has been the subject of much legislation by Parliament, which has generally established in lieu of the old system a fixed money rent charge payable annually. Consult Clarke, H. W., 'History of Tithes' (1891); Degeée, S., 'The Parson's Counsellor with the Law of Tithes' (1820), and Selden, J., 'History of Tithes' (1618).

TITHING, an old English subdivision of the population. It consisted of a company of about 10 households, one of the integral parts of a hundred (see Statute), who were regarded as a distinct political division for some purposes of police and civil regulation. At its head was a tithing man, who was directly responsible to the officers of the Crown, the several members of the tithing being bound for the peaceable behavior of each other. The institution of the tithing has passed away, the tithing man has evolved into the police constable, but in some parts of England British conservatism still preserves the name and the corresponding territorial distinction.

TITHING MAN. See TOWN AND TOWN MEETINGS.

TITHONUS, thi-tho'nis, a son or nephew of Laomedon, king of Troy. He was beloved of Eos (Aurora, Morning), who induced Zeus to make him immortal. Her prayer was granted but she had neglected to ask for perpetual youth, and in time her lover took on all the signs of extreme age. Tithonus prayed to the gods to be relieved of this 'terrible immortality, and was metamorphosed into a grasshopper. Thomas has written a remarkable poem, 'Tithonus,' on this mythological incident.

TITIAN (Tiziano Vecelli), the greatest painter of the Venetian school and one of the world's greatest painters: b. Pieve in Cadore, a district in the Venetian or Carnic Alps, 1477; d. Venice, 27 Aug. 1576. He was the son of Gregorio di Conte Vecelli, a descendant of an ancient family and a man of some note in his province. It was the custom of this family to follow arms of the law, but young Titian showed such genius for art that at the age of nine or ten he was sent to Venice to learn painting. He studied under Gentile Bellini and afterward with Giovanni Bellini and then attached himself to Giorgione, who was the idol of the day. The delicate, exquisite frescoes for the Fondaco dei Tedeschi, the exchange of the German merchants in Venice. After Giorgione's sudden death by the plague in 1510, Titian completed several of his master's works. Titian'sown pictures show much similarity to Giorgione's and are often referred to as 'Giorgionesque Titians.' One of the most famous is 'Sacred and Profane Love' (in the Borghese Gallery, Rome), about which so much has been written. To this period belong the 'Virgin and Child' (Vienna Gallery), 'The Virgin and Child with Canon Zizanegalli' (Paris); Bishop of Paphos, or 'Buffon' (Antwerp, Gallery); 'Saint Mark' (in the Salute, Venice); the 'Three Ages' (Bridge-water Gallery, London); Madonna of the Cherries (Vienna Gallery); Daughter of Herodias (Dresden Gallery); 'Christ with the Tribute Money' (National Gallery, London).

In 1511 Titian went to Padua to paint frescoes in the Senola di S., and returned to Venice in 1513, where he became superintendent of government works and was ordered to complete the paintings left unfinished by Giovanni Bellini in the Hall of Great Council of the Doge's Palace. Her painted the portraits of three successive Dukes of Ferrara, for whom he painted charming works, including the 'Worship of Venus' and the 'Bacchanal,' with Aegina over her wine-cup (both in the Alte Pinakothek, Munich, and the superb 'Judging of Cadmus and the Superbia' (in the National Gallery, London). At this period he formed a friendship with Aretino, whose portraits he painted. In 1517 while painting these delightfully decorative pagan triumphs of Bacchus and Venus, he began work on the 'Assumption,' or 'A Life of the Virgin,' for the church of the Frari, Venice (now in the Academy). This was finished in 1518 and caused a sensation, for it was considered the astonishing performance in color on a scale that had as yet been executed. The gallery now preserves the famous 'Presbytery of the Virgin,' a large and much picture, and one of Titian's masterpieces. In 1526 he completed 'Pesarva Madonna,' on which he had worked for seven years. This is still in the church of the Frari and represents the Madonna, crowned with adoring saints, including George, and members of the aristocratic family beneath the group. (Also in the Louvre), belonging to the Duke of Northumberland, is a work of the same general character. "Entombment of Christ" (in the Louvre), another early work, and "Christ Crowned with Thorns" (also in the Louvre) still shows influence of Giorgione.

In 1525 Titian married. Nothing is known of his wife, who died in 1530, leaving one child, the infant Lavinia. Titian painted so many beautiful portraits of this noted and beautiful child that it was a long time before he could find a model to compare with them. In 1532 the portrait of Charles V, the emperor, was begun and was, in consequence, created P. Latine and a Knight of the Garter. His two sons were also made nobles and he was made a baron, an unusual honor for a painter. From this time onward Titian enjoyed a success greater than that any other painter had awarded to them, with the exception of Raphael, Michelangelo and Rubens. D'Archiac, Marquis des Vasto, gave

Leonardo da Vinci and Michæl-
's one great supreme endowment of
painting. Titian's art properly be-
as the greatest manipulator of paint
1 to color, tone, luminosity, richness,
fitness, surface and harmony and with
the production of a pictorial whole
converging to the eye, a true, dignified
and beautiful impression of its general subject
matter and of the objects of sense which forms
its constituent parts. In this sense Titian has
never been deposed from his sovereign power of
painting. Titian's pictures abound with mem-
ories of his home country and of the region
which led from the hill summits of Cadore to
the Queen City of the Adriatic. He was al-
most the first great painter to exhibit an ap-
nreciation of mountain, mainly those of a
turretted type, as exemplified in the Dolomites.
Indeed he gave to landscape a new and original
vitality, expressing the quality of the objects
of nature and their control over the sentiments
and imagination with a force that had never
been before approached. The earliest Italian
picture expressly designated as 'landscape' was
one which Titian sent in 1552 to Philip II.
Naturally a good deal of attention has been
given by artists, connoisseurs and experts for
probing the secret of how Titian managed to
obtain such extraordinary results in color and
surface. His figures were put in with the
brush dipped in a brown solution and then
altered and worked up as his intention de-
veloped. In his earlier pictures the most
useful color rests mainly upon red and green; in
the later ones upon deep yellow and blue. The
pigments which he used were not unusual;
indeed they were both few and common.
Palma Giovio records that Vecelli would set
pictures aside for months and afterward ex-
aming them as if they were mortal en-
emies would set to work upon them like a man
possessed. Also that he left many pictures in
progress at the same time, turning from one to
the other, and that in his final operations he
worked far more with the finger than with the
brush.
Titian seems to have taken Palma
Vecchio as his model for softness and Giorgi-
one as his model for richness. He distanced all
his predecessors in the study of color as ap-
plied to draperies.
Titian excelled in every style. The 'Assump-
tion of the Virgin' is ranked as one of the
world's greatest pictures and the 'Entombment
of Christ,' the 'Christ Crowned with Thorns'
(Louvre), the 'Ecce Homo' (Vienna Gallery),
in which Aretino posed for Pilate, the 'Sup-
ner at Emmaus' (Louvre), 'Saint Mark'
(Salute, Venice), the 'Presentation in the
Temple,' 'Christ in the Garden' (Madrid),
'Noli me Tangere' (London) and 'Saint
Jerome' (Barera, Milan) attest his power in
religious subjects. An exuberant fancy and
dash characterizes his delightful mythological
production such as 'Bacchus and Ariadne'
(National Gallery), 'Bacchus and Ariadne'
('National Gallery'), 'Worship
of Venus,' 'Diana and Actaeon,' 'Callisto,'
'Jupiter and Antiope,' 'Europa,' 'Venus'
(Pondo), 'Venus and Cupid' (Florence),
'Danae' and 'Venus and Adonis' painted for
Philip II, 'Venus Anadyomene' (Bridgewater
Gallery), the 'Madonna of the Cherries'
(Vienna) and the 'Madonna of the Rabbit' or
'Madonna del Consiglio' (Louvre) prove that his
'Virgin and Child' can stand comparison
with any other great master in Italian art. As
portrait painter Titian is unequalled. Accord-
ging to Vasari 'There has scarcely been a
noble of high rank, scarcely a prince or lady
of great name, whose portrait has not been
taken by Titian.' His list of famous men and
women is long. Perhaps at the very top stands the unknown ‘Man with the Glove’ (Louvre), young, hand-some and charming. Many times was the Duomo of Urbino, containing four superb studies: Catarina Cornaro, Queen of Cyprus, Sandovino, Francesco, Duke of Urbino and Eleanora, the Duchess of Urbino. Charles V on horseback at the battle of Mühlberg, now in the Prado, Madrid, shows what kind of man the emperor was. Titian painted three portraits of himself: one in early life (Vienna), one in middle age (Berlin) and one in old age (Prado, Madrid). Francis I (Louvre), though a great portrait, was not painted from life, for Titian never saw this sovereign. The famous work in the Louvre called ‘Titian and his Mistress’ represents Alphonso, Duke of Ferrara and his wife Laura di Dianti. Pope Paul III was another fine sub­ject for ‘Vittoria’ or ‘Last Judgment’ in which Charles V appears, so loved by the emperor that he had it in his room during his last illness and kept his eyes fastened on it till the last. Titian also painted one great historical work in 1559, ‘The Battle of Cadiz,’ representing the moment when the Venetian captain, facing the enemy, dashed into the rushing stream with men and horses. All are re­presented life size. This picture perished by fire in 1577 and is only known to-day by Fontana’s engraving and a sketch by Titian in the Utzizi.

‘Titian,’ writes Kugler, ‘was born in grand Alpine scenery amidst a sturdy and vigorous race; and it is in the combination of these ances­ceds with the gorgeous color and splendid forms of Venetian life that we trace that breadth of qualities so conducive to the develop­ment of art in which he takes precedence of every other painter. Two forms of nature especially courted his pencil—landscape and portraiture; and in each he revealed to the world treasures of truth and poetry not worked out before. For Titian is not only the painter of humanity in its largest distinctions—in the beauty of woman, the dignity of man and the artlessness of childhood—but he is especially the delineator of all those under every aspect of the high born and the affluent placed classes of society. Sir Joshua Reynolds says of him whatever he touched by a kind of magic he invested with grandeur and importance. The intellectual, the noble, the splendid, the well-formed, the well-dressed, were the mutual subjects of his art. His type accordingly of Christ, John the Baptist and the Virgin in which the pride of life and the abnegation of self are incompatible qualities cannot satisfy those who look for the realization of a sacred idea. Titian can, therefore, hardly rank as a painter of religious feeling, but in whom the pride works when the waves still influence of Giorgione.”

ESTHER SINGLETON

TITICACA, tê-tê-kâ’kâ’, the largest lake in South America and one of the most remarkable on the globe, situated on the southeastern boundary of Peru, its eastern shores belonging to Bolivia. It is about 130 miles wide and 39 miles wide through most of its length, though 43 miles at one point. It lies at an altitude of 12,635 feet, in a large plateau basin between the two main cordilleras of the Andes. It is of irregular shape, and contains several islands. Copacabana Peninsula almost cuts it in two at the southeast extremity. The greatest depth is 720 feet. Its surplus water is discharged southward by the river Desaguadero, which flows into Lake Ullagagas, and thence disappears in the Salinas Grandes, so that it in whose way the lake does not reach the ocean. Lake Titicaca was formerly much larger than now, and is still decreasing in area. There are geologic evidences that it formerly discharged into the Amazon watershed, in the eastern side of the Cordillera Real. In spite of the high alti­tudes the shores are inhabited, and steamers ply on its waters. The largest island in the lake also bears the name Titicaca. Puno is the largest town on its shores, which was the seat of a prehistoric civilization of great interest, and the islands and the regions around the lake contain some of the most interesting architectural remains of ancient Peru.

TITLARK, a small lark-like bird of the family Motacilleta, many species of which inhab­it most parts of the world in every variety of region, some being migratory, others per­manent residents. The nest is made upon the ground, or dry grass and stalks, lined with finer plants and hair, and the eggs are four to six. The American titlark (Anthus rubescens) has six and one half inches long; its back is brown; the tail is black; its head, facial region and neck are greenish; the under tail and innermost tail feathers are white. It is very generally distributed over North America, extending to the Pacific and to Green­land, and is accidental in Europe. The flight is exceedingly easy and graceful; it occurs in flocks of tens or hundreds, running fast on the ground, vibrating the tail whenever it stops, not squatting like the larks, but moving the body on the upper joints of the legs. It is found in the fields, on the prairies, along rivers, and on the seashore; the notes are clear and sharp, the last much prolonged; it breeds in the East only north of the Cape Fear River, and especially in the coastal districts of Labrador; but in the Rocky Mountain region it spends the summer much farther south, but in cool elevations. This bird is very similar to the A. olivaceus of Europe, though the latter has a longer bill and less arches.
ens, and has no yellowish supercilium: the outer tail feathers are not white, but the eyes are less distinct below. Among the European species the most extensively dissected is the meadow titlark or pipit (A. sciu), which is a favorite field-bird in Britain. The tree-pipit or titlark (A. variegatus) is another favorite. Both are kept in gardens. Consult general works, and 'Birds of the Northwest' (Washington

TITLE-DEED, a paper, or one of several written, printed, or partly written, describing a property in and through which ownership or authorship became into the present custody, by virtue of a person claiming ownership or title. It is often used in the plural to denote several muniments of title turned over or granted on delivering the property to the one or his agent and in this sense title means any documents containing evidence of title or any part of the title to real or other property so granted. Every one is supposed to have his own deeds, but the modern system of registerable estate transfers requires an official of the title-deeds to be entered in the title of the registrar or of whatever public assumes the duties of registrar, and be open to the public inspection.

TITLE INSURANCE is effected in count-, having public offices for the record of to real estate through the agency of title companies. This business has as much importance in the United States where a system is most fully developed. In this y law requires all transfers of real estate, mortgages, wills, judgments, etc., to b dead in official registers open to public inspec-. In the larger cities these records became so voluminous that the matter of titles became a cumbersome affair calling for the prolonged services of expert real-ty. Moreover such research was attended with long delay and with great expense; yet it had to be repeated every time a fresh or mortgage took place, since the or mortgagee was not apt to accept the title without assurance of its being un-laid and sound in title. Finally in 1876 Philadelphia company was organized to enter titles, and the plan proved so suc- that companies have since been organized nearly every large city in the country. An operation of these companies calls for an independent and sometimes inaccurate method of public record offices the title insurance into their own records of real titles in the locality in which the they need must maintain for this purpose a staff of expert title examiners. On account of the size of its force a well-equipped company can make the first examination and put of a title in less than a week, whereas one to three months was sometimes re-by the practising attorneys. The fee is fixed, but in this instance it is usually about me as that charged by a reliable lawyer, case of a long examination, about one per cent of the value of the property assessed; but it has the added advantage of guaranteeing against loss if there is any inaccuracy of the search. After a property has been once examined, it is then clear that, the noting of future transactions affecting it is a simple matter, and subsequent guaranties are issued upon short notice and for a small fee.

TITLE TO PROPERTY. See Realty.

TITLE REGISTRATION, a system of public records under which titles to real property are recorded in public offices for the purpose of expediting the process of transfer and of giving legal notice to claims of ownership to lands so entered. In England the registration of titles is of comparatively recent introduction, the system being due to the land transfer acts of 1875, under which it was first successfully practised. The office of record in that country is conducted by a registrar ap-pointed by the lord chancellor, who also fixes the fees for the various services of the office. These fees, paid in the form of stamps, provide the emoluments of office from which the registrar draws his pay. Under the act of 1875 the registrar must approve of the title submitted and in case of a sale the vendor must make affidavit that he has produced all the deeds, wills and other instruments of title as well as all the evidences of encumbrances on the land, in order that the registrar can make a fair entry. When once a title is registered no adverse title will acquire any advantage by length of possession, but any person claiming an adverse interest can lodge a caution of that fact and be entitled to notice of all further transactions on the property. When the register-terd land is sold the name of the transferee is entered on the register and he is issued a certificate of title. The law is not compulsory in England, but is being gradually adopted because of its advantages over the old system.

In the United States it early became customary to register titles, mortgages and notices of transfer of interest, encumbrances, etc., in public offices, usually in the office of the county clerk of the court. This officer has no judicial or discretionary powers and is empowered only to register official copies of deeds, mortgages, agreements, etc. In place of the old certificate the clerk notes on the original or a duplicate deed that a true copy has been entered on the official register and this copy becomes legal notice of claim of title to all the world. The clerk of the court, who is a county officer in the United States, and elected, not appointed, frequently delegates this part of his work to an appointed assistant known as the registrar of deeds. Between the parties of a conveyance the recording or non-recording of the instrument is of no moment, but conveyances made after the first is rec-orded are void, and any conveyance not re- corded is void as against a subsequent conveyance to a bona fide purchaser from the person in whose favor a recorded conveyance has been executed. State regulations, however, usually govern the matter of registration in regard to its effect as constructive notice. For the *Australian system* of national land registration, see Torrens System.

TITLES, words or phrases bestowed on individuals as a mark of distinction, rank or
dignity, and in some cases implying office or vocation. Titles may be official, honorary, civil, military, or temporal or ecclesiastical. The use of titles is as old as civilization and seems to have arisen from titles bestowed for some public service, and only later to have been bestowed in virtue of the dignity of the office or employment of the recipient, and even later to have become hereditary. As used by the Greeks and Romans, however, titles conformed to the first and the last customs—they were bestowed for service and were hereditary. Later, Roman officials carried their titles with them irrespective of the merits of the holders, for example, the names Cæsar and Augustus, and the phrase pater patriae, all of which came to be applied to the imperial throne regardless of the character of the occupant.

Titles today in existence in Europe are interesting relics of the feudal period. First came the titles of count and duke. Counts (comites, companions) were the followers of the feudal lords and the dukes (dux, leader), the military leaders of the people. Later came the appellation marquis to denote those in charge of the marchi, marshes, usually on the frontiers or border lands. Under the count came his lieutenants with the title of viscounts. Among modern rulers the titles marquis, earl, and viscount are often given to important feudal personages, the great tenants-in-chief of the Crown. The knight was he who had received an order of chivalry or knighthood, and so on through the several grades of feudal society.

Among modern rulers the titles king and emperor with the feminines and in the case of the late Russian Empire that of tsar, are the titles of supreme heads of government. The title king harks back to a period when its bearer was chief of a knightly band as the head of his tribe. The later rex and its derivatives in the Romance languages denotes a ruler. And the word emperor, which is used in the same sense, originally denoted the ruler of an empire or a confederation of several states, each of which had a king at its head. In this respect the word was advisedly applied to William II, late emperor of Germany. Meanwhile it had become customary to add to the titles signifying the office, honorary qualifying titles. Henry IV of France was called "Gracieux"; Edward IV, "Most High and Mighty Prince"; Henry VII, "Highness"; and Henry VIII, "Majesty." This latter title was universally adopted by the sovereigns of Europe, and was subsequently subjected to further qualification, and the title of James, I, who was called "His Sacred Majesty of England," and was formally addressed as "James, by the Grace of God, King of Great Britain, France and Ireland, Defender of the Faith, etc. Catholicae," and upon admission his elevation, as "Cætholica," for Spain, "Most Faithful" for Portugal, etc. The present ruler of Great Britain receives the title, "George V, by the Grace of God, of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the Seas King, Defender of the Faith, Emperor of India," and the eldest son of the British sovereign is styled Prince of Wales, and the eldest daughter Princess Royal; the other sons and daughters are styled prince and princess, and all those with the children of the sons of the sovereign, are addressed as Royal H. The five orders of nobility in Britain distinguished by the titles of honor—marquis, earl, viscount and baron. Nobles have several titles, granted by patents, in their progressive steps in the peerage. A duke may thus be a marquis, an earl, a viscount, and a baron. One of the inferior is permitted as a matter of social dignity and assumed by the eldest son. Thus the son of the Duke of Sutherland takes his courtesy title, as it is called, of Marquess of Stafford. Courtesy titles do not raise the bearers above the rank of commoners, consequently the eldest sons of peers are eligible for election as members of Parliament. The title of esquire and master (Mr.) are now indiscriminately to nearly all classes of sons. The Continental titles of prince, marquis, count, viscount and baron, differ considerably from the corresponding titles in England. Thus in England the prince is confined to members of the royal family; Austria has, or had, archdukes but dukes, Russia had only grand dukes.

It is an axiom that hereditary titles their value in proportion as they become common. In England this latter danger is obviated by the rule of primogeniture which insures that there shall be but one bearer of a title in a generation, while in France all the sons receive titles, the eldest the highest title, for instance, that of duke, the second son, marquis, and so on. In Mohammedan law, only hereditary title is that of sherif in the ruling houses. Pasha and bey, as purely military titles, are now conferred on civilians, but are not hereditary. Japan, a system of titles closely resembling that of Europe, and like the latter, based on a feudal system. China, under the empire, added the ancestors of the person to honor and usually made the title hereditary for a stated number of generations. Turkish sultan is style pâhâsh (lord king) as head of Islam he is "the Commander of the Faithful." The ruling houses of India graduated system of titles closely akin to that of Europe. The Pope of Rome is thus the title "His Holiness," and addresses "Your Holiness," cardinals by the title " Eminence," bishops as "Monsignor," England as "My Lord." The title of "The Lord Bishop of," of a see, the "Most Reverend the Lord Archbishop," deans and archbishops as "Very Reverend," all men and ministers of the Christian Faiths are now generally styled " Reverend." Titles in the United States—
and other titles of nobility are forbidden to Federal Constitution and the citizen of the country who bears such a title when he uses a citizen of the United States must use his title. Various offices of dignity must carry with them certain forms of address, but these forms of address pertain to offices alone, and the holders of these offices have no claims to the prescribed form of address after their terms of service have expired.

The President, governors of States, and members of Congress, heads of departments, int secretaries, comptrollers and auditors, treasurers, clerks of the Senate and House representatives, State senators, law judges, of cities, etc., are entitled "Honorable." Officers of the navy, naval, ecclesiastical and other prawn dignities are distinguished by the common to the English-speaking peoples in the world. Consult the Almanach de Gotha, Burke's Peerage, Complete Peerage (new ed., 1910);Phillips, or Alison, Titles of Honor (in Encyclopaedia Britannica, Vol. XXVI, Cambridge

**TITLES OF HONOR.** See Orders and Decorations, Titles.

(TMARSH, M. A., or Michael Angelo, idiom employed by Thackeray when using his Paris Sketch Book, Yellow-Papers, etc., to Fraser's Magazine.

**TITMOUSE,** one of the diminutive birds of the subfamily Parinae, family Passeridae, which mong the most interesting of passerine birds. There are more than 75 known species, widespread over most parts of the world, but most abundant in the rate and colder regions of the northern part. None of them are really migratory, though many roam widely during the winter in search of food, nor are they migratory, though in this particular also stress of weather frequently causes them to gather in flocks, often with other small birds, as red-wings, etc. They are not songbirds, h most of them have characteristic, and ently musical, call notes, and during the breeding season they sing after a fashion, weakly. They are very active, restless, ar birds, usually showing little fear of and sometimes coming about houses in continual search for food. They eat thing from seeds to the eggs and young. The nesting habits are varied, and lay numerous eggs and raise two or three broods each season. The plumage is brilliant, though occasionally striking, most frequently plain, though very taste-structurally the titmice, aside from their size, are hard to distinguish from the to which birds their habits also ally them any ways. The bill is short and stout, ht and unnotched, and there are no rictal tubs of feathers, directing forward, entirely covering the nostrils. The feet are stout, with late tarsi and short toes. The wing is rounded, with 10 primaries, of which the first is exceedingly short. The tail as long as or longer than the wing is composed of 12 feathers, and usually rounded or graduated. The plumage of the body, long, soft and loose.

Of the 75 species of titmice, one-fifth occur in America all of these having been taken within the limits of the United States. About two-thirds of all the species belong in the genus Parus, and the same proportion holds among our American forms. The most abundant and familiar of our species is the black-capped titmouse (P. atricapillus), widely distributed and known everywhere as the chickadee. The typical form ranges in eastern America from typical form ranges in eastern, but closely allied sub-species, or species, occupy practically all the rest of the Continent. The general color is ash-gray, the back with a brownish tinge, the under parts white, or nearly so; the crown, nape, chin and throat black, with the cheeks white. In size, the various forms range from four and one-half to five and one-half inches, of which the tail is about half. The chickadee is a very active, tireless little bird, returning to the woods and swamps during the summer, but in winter very abundant in our villages and parks and about houses. It can easily be attracted to any spot where food is provided, and if unmolested by cats or otherwise will soon become very familiar. Although it eats bread and crumbs and other articles of a vegetarian's diet, its tastes are carnivorous and it is especially fond of "meat-on-the-bone." When foraging for themselves, chickadees eat an enormous number of insects and thus justify their existence, if that were necessary. As a matter of fact chickadees are so familiar, so daintily clothed, so cheerful even in the severest weather, so courageous, and their usual call note "chick-a-dee-dee," is so pleasing, none of our birds is more universally loved and enjoyed. In the spring, when the mating begins, the chickadee has another note, a plaintive, though not drawn out, "pee-pee." The nest is a mass of moss, feathers, wool, plant down, etc., placed in a hole in a stump, tree or fence post, usually not far from the ground. The eggs are from five to eight in number in each of the two broods, and are white, spotted with reddish-brown. The chickadee of the South Atlantic States (P. carolinensis) is said to have notes quite different from the northern species. In the southeastern United States, ranging north to New Jersey, but rarely further, is another very abundant titmouse, quite different from the chickadee in both color and form, known as the tufted titmouse (Parus bicolor). It is a gray bird, with a black forehead, and a conspicuous crest, an inch longer than the chickadee and not so attractive. The notes are not so attractive as those of the chickadee and become monotonous; the most common rendering in words is "peto, peto, peto," but it also has other calls. The tufted titmouse is not so familiar or confiding as the chickadee and is distinctly a woodland bird, seldom seen about houses. It is not shy and is readily approached, while the prominent crest makes it easy to recognize. The nesting habits and the eggs are similar to those of the chickadee, but the latter are considerably larger. A tufted titmouse occurring in the valley of the Rio
Grande (Parus atricristatus) is notable for its glossy black crest, while the bridled titmouse (P. columboides) is a related species occurring in the southwestern United States and is remarkable for the very conspicuous black and white markings on the head. Besides several other interesting species of Parus, the southwestern United States is the home of four or five very small titmice, belonging to the genera Psaltriparus and Atricapillus. The former are called "bush-tits" and though very plainly colored with black, brown and plumbeous, their very small size, four inches or even less, and their large, waven, penistle nests, with lateral entrance, make them an interesting group. The gold tit (Atricapillus flaviceps) is of about the same size, but is notable for the rich yellow head, the other upper parts being ashy and lower parts whitish. These little birds build great globular nests of twigs, in the bushes, lining them with down and feathers. The eggs are pale bluish speckled with brown.

Of the tits of the Old World, seven species occur in Great Britain, but one of them, the crested tit (Parus cristatus), is only an accidental visitor. The great tit (P. major) is the largest European species, though only about the size of our tufted titmouse. The general color is yellowish and grey, with white cheeks and black head and throat. The blue tit (P. caeruleus) and the cole tit (P. ater) are the commonest of the English species. The former has the top of the head light blue and a bluish cast to the rest of the plumage. It is the species usually called "tomtit." The azure tit (P. caeruleus) of Siberia, which is sky-blue and white, and the large Japanese tit (P. varius), which is handsomely marked with chestnut, will serve as examples of the more brightly colored titmice. The long-tailed tits of the genus Eptithelius are remarkable not merely for their exceptionally long tails but because they build very elaborate cozy nests, which are purse-shaped and hang free or are attached along one side to the trunk of a tree. The eggs are very numerous, as many as 20 having been found in one nest.

Consult in addition to standard ornithologies, Cones, 'Birds of the Northwest' (Washington 1941); and Birds of the Colorado Valley (Salt Lake 1887), and Evans, A. H., 'Birds' (in 'Cambridge Natural History,' Vol. IX, New York 1900).

TITTLEBAT TITMOUSE, the name of a London shop clerk who figures as the hero of "Ten Thousand a Year," a novel by Samuel Warren (q.v.).

TITULAR BISHOP, an episcopal title in the Roman Catholic Church substituted by Pope Leo XIII for the older one of bishop in partibus infidelium.

TITULAR CHURCH, a name given to the parish churches of Rome, as distinct from the patriarchal churches, which belong to the Pope, and from the oratories. Each titular church is a cardinal priest, has a distinct assignation to it, and a font for baptism in case of necessity.

TITUS, companion and well-loved friend of Saint Paul. He was converted by the apostle (Tit. i, 4), at Antioch 50 or 51 A.D., and in the same year accompanied him to Jerusalem, and was present at that first council recognized Gentile converts as part of the Church, and exempted them from some of the Mosaic ritual (cf. Acts xv. 1-11, Gal. ii, 1-3). Paul soon afterward carried the liberty thus accorded by refusing to Titus, a Greek, to be circumcised (Gal. ii, 14). Titus was subsequently with Paul at Ephesus (56), whence he was sent as mission to the Corinthians, carry the second epistle to that church (vii. 6, 12, 23; xii. 18). When Titus (57 A.D.) he found the apostle in Miletus (2 Cor. vii. 6-22, 13-15). Salutary news that Titus left Crete to affairs of the Church and "ordained every city" (Tit. i, 5). Returning Rome he was dispatched by Paul (60 A.D.)—Dalmatia (2 Tim. iv. 10). Titus ren his work in Crete, and died at an age. See also Titus, Epistle to.

TITUS, Flavius Sabinus V., Roman emperor: b. 40 A.D.; d. Reate, Ist Century. He was the son of Vespasian, and succeeded as emperor in 79 A.D., and was brought up at the court of the Emperor Britannicus, whom he accompanied in in Germany and Britain. Later he was a legion in the war of Vespasian and the Jews, conducting the campaign in Judea in the place of his father, who was to the imperial throne. At the end of the and cruel siege Jerusalem was taken by the of Sept. 70. Titus returned to Rome in 71, he was rewarded with the title of Emperor, given a part in the government of the empire. He early manifested the abilities of a and able ruler and he became the most Roman people. The Colosseum, by Vespasian, was completed under his direction. The public baths named in his honor, institutions for the public benefit were established by him.

TITUS, Epistle to, one of the seven letters of Saint Paul, stated to have been written by Titus, as bishop over the Cretans, from Crete, in Macedonia. It is known as one of the "Pastoral Epistles," because devoted to the subject of pastoral duties. In this epistle Saint Paul describes the bishop ought to be, and applies severe to certain of the Cretans. This, and epistles to Timothy, have been much discussion. See Timothy, Epistles to.

TITUS ANDRONICUS. See ANDRONICUS, The Shakespeare canon preserves a speech to almost total absence of external evidence in the case of 'Andronicus' the tantalizing certainty arises from the existence of a large mass of data. Shakespeare's statement in the tragedy is the double testimony of Mere, who lists 'Titus Andronicus' among his tragedies, and of Hemming and Co. in 1623 included the play in the Folio. On the other hand, there are strong claims to anonymity, and the evidence is not enough in the case of the ... surprising that the publishers ... 1611 quartos should not Shakespeare's then popular.

German play of Titus Andronicus
regnant empress (ca. 1620), has been
discussed by H. De W. Fuller (Pub-
lications Modern Language Association 1-65,
1901); but it seems probable that these foreign
works, as well as another German play of
which traces exist, are based upon perversions
of the extant 'Titus Andronicus' text, as dis-
seminated by traveling English actors, and not,
as Fuller argues, upon two hypothetical earlier
English plays. Early 17th century allusions to
'Titus Andronicus,' though not very numerous,
are such as to prove that the play was popular
with the masses of the public. Later, John
Downes, writing of the performances of Sir
William Davenant's company after the Resto-
ration, mentions 'Titus Andronicus' among
several others which being old plays, were
acted but now and then; yet being well per-
formed were very satisfactory to the town.
In 1687 Edward Ravenscroft published an
adaptation 'Titus Andronicus, or the Rape of
Lavinia. Acted at the Theatre Royal,' with
a preface containing some important remarks
concerning the old play. Among the more un-
conventional modern theories regarding the
authorship of 'Titus Andronicus' may be noted
Grosart's argument that it was written by
Greene, 'Englische Studien' (1896); J. M.
Robertson's that it is essentially Peele's 'Did
Shakespeare write Titus Andronicus' (1905),
and an ill-considered recent hypothesis of
H. D. Gray that the play was originally by
Shakespeare, revised by Greene and Peele,
'Fügel Memorial Volume' (1916).
TUCKER BROOKE.

TITUSVILLE, Pa., city in Crawford
County, on Oil Creek and on the Pennsylvania
and the New York Central railroads, 100 miles
north of Pittsburgh and 50 miles south of
Erie, Pa. The city is on a plain which slopes
slightly toward the south and east. The natu-
ral drainage is supplemented by an excellent
system of sewerage. The water is obtained
from artesian wells. The broad streets are
largely paved and tree-lined. Electric trolley
lines traverse the principal streets. The manu-
factoring industries consist of one of the larg-
est iron works in the country, a high grade
steel works, machine shops and foundries, large
oil refineries, paraffine works, la
the American radiator works, large branch of
the Bethlehem Steel Company, chemical works,
plaining mills, specialty works, cutlery
works and an electric light and power plant.
The output consists of iron, car tanks, steam engines
and boilers, forgings, oil well machinery and
fittings, gasoline engines, refined oils, gasoline,
etc. There are large oil fields in the vicinity
and the first well sunk for petroleum was
drilled just outside of the city limits in the
summer of 1859, striking oil on 27 August
of that year. There are three banks consist-
ing of a national bank, a commercial bank and
a trust company. One of the finest banking
buildings in the State was erected in 1918.
Among other public buildings are 12 large edi-
ces and two halls for religious services, a
high school with a four-year course, four
graded public schools and a kindergarten, all
under one superintendent; Saint Joseph's Acad-
emy, kindergarten and parish school. There
is also an excellent library, 'Benson Memo-
rial Library,' an excellent Young Men's
Christian Association and Young Women's
Christian Association and the Titusville Hospi-
TITUSVILLE was first settled in 1796, becoming a borough in 1847 and chartered as a city in 1866. The town was laid out in streets in 1800. It suffered great damage from flood and fire 5 June 1892 which destroyed one-third of the city with a loss of 60 lives. The city owns and operates the waterworks and one of the electric light plants. The government is vested in the mayor and five commissioners, the mayor being elected for four years and the commissioners for two years. The majority of the people are native born, the predominating foreign element consisting of Scandinavians, Irish and Germans. Pop. 8,550.

TIUI, tē-wē’, or TIVI, tē-vē’, Philippines, pueblo, province of Alay: on Laganay Bay, on the northeast coast, 23 miles north by west from the pueblo of Alay. It is the centre of a hemp growing region, and exports hemp by way of Tabaco. It is especially celebrated for its thermal springs of iron and sulphur waters with medicinal properties, which are visited by large numbers of natives. Pop. about 11,000.

TIUMEN, tiō-mēn’, Russia, in Siberia, government of Tobolsk, 120 miles southwest of Tobolsk, on the Tura River. It is an important centre of trade, lying on several commercial routes with good communication. It has a large technical school. Its principal manufactures are leather, soap, candles, carpets, pottery and woollen goods. These articles are exported to China, the Kirghiz steppe, Bokhara and many parts of Siberia. The Tiumen and woven carpets are especially renowned. In Tiumen was located a famous exile prison. Pop. about 35,000.

TIVERTON, R. I., town in Newport County, on Narragansett Bay, near Fall River, Mass., and on the New York, New Haven and Hartford Railroad. There are cotton manufactories and oyster and fishing industries. Pop. 4,032.

TIVOLI, tē-vō-lē, Italy, in the province and district of Rome, on the Teverone or Aniene, 16 miles northeast of the capital. Its position on a rocky height overlooking the river is extremely picturesque. Tivoli commands a fine view of Rome and the Campagna. It contains a fine modern cathedral which contrasts sadly with the other town buildings. Its antiquities are numerous and interesting, and include a temple of the Tiburtine sybil, temple of Vesta, villa of Hadrian, etc. The artificial cascades formed by the Teverone constitute an interesting feature of the landscape and supply power for the electric lighting of Rome, and for various factories. The old Latin name was Tibur, important in the Latin Confederation. It became subject to Rome in 388 B.C. The population of the commune is about 15,000. Consult Baedeker’s ‘Central Italy and Rome.’

TLAPAALAN, the mythical home of the Toltecs, and the land from which came their great culture god, Quetzalcoatl, and to which he returned when his mission on earth was done. See QUETZALCOATL; MEXICO—MYTHOLOGY; CHORTLE.

TLAXCALA, tlāsk-kā-lā, or TLASCALA, Mexico, the smallest state in the republic, situated between the states of Puebla, Hidalgo and Mexico. Area, 1,534 square miles. The capital, TLaxcaLa, located about 60 miles east of Mexico City, was in ancient time a large city, but 1909 population is only 2,800. It has a beautiful palace and a stately house that retains much of their former grandeur. The holy well of Olan, in the suburbs, is covered by a costly imposing sanctuary. The state lies within a plateau region, and its surface is broken by high mountains. The principal occupations are agriculture and the manufacture of textiles. Though iron and silver are found, much of its trade is with the sea. Pop. about 192,000, almost all Indians.

TELEMEN, tē-lēmēn’, Algeria, in the department of Oran, 70 miles southwest of the city of Oran, and 30 miles from the Mediterranean. It is a walled town with nine gates, divided into three sections, namely, the old military establishment, the business section, containing the residences of the population native to the town, and the native section. The town stands on a mountain slope at an elevation of 800 feet, amid olive-groves and vineyards. It has some mosques, Protestant and Catholic churches, and a Jewish synagogue. The tenebre comprise textiles, carpets, and small art objects. Trade is especially with Morocco. It is a historic centre of the mountains, dating from the 13th century. At the height of its prosperity, in the 13th and 14th centuries, it is reputed to have had 125,000 population. Pop. 39,874.

TLINKET, or TLINKIT, a tribe which constitutes a distinct stock known as Kolusiana. They are on the coast and islands of southern Alaska. They were rudely constructed, and their members carried on with neighboring tribes. Trade was carried on extensively. They were treated by their masters with cruelty. They have greatly diminished in numbers, till there now remain but about a large number of them being employed in canning industry.

TO A SKYLARK. Shelley’s ‘Prometheus Unbound’ in 1821. As the poetical男女。 It has been used in generations of women and “selections,” but even so careful handling has not served to tarnish qualities in which it still remains unapproachable. Shelley’s ‘Prometheus Unbound,’ is a spirit not a bird, an aspiration. It is besides the poem has the defects of

MARION TUCKER.

AD, an amphibian of the anourous 

Bufoidae or some related family in the 

Arvicolidae, in allusion to the structure of 

ulder girdle. The Bufoidae present the 

ig distinctive features: The tongue is 

veloped, fixed to the front of the mouth, 

: the hind end free. The result of this 

ment is that it can be filleted by means 

opiate muscles with the greatest speed 

cision, and thus serves to make these 

ually toothless animals in the capture of in-

ich adhere to this mucous-coated organ. 

re always absent from the jaws, but may 

ent on the vomer in a few foreign gen-

he hind toes are more or less webbed, 

: toes webless and the ends of the toes 

 her clawed nor furnished with adhesive 

In all cases the vertebrae are prococulus 

: bodies hollowed in front, the 

se processes of the sacrum are ex-

and ribs are absent. This family is an 

re one of about 15 genera and 100 species 

osmopolitan, but is especially well rep-

: in tropical America. The species differ 

rably in habits, most of them being ter-

: burrowers, but some are aquatic, others 

: in the United States, Bufo is the only 

: being represented by 9 or 10 species, 

: which belong to the southwestern 

: and Mexico. The common east-

: Bufo (B. leutinmus) is found in one or 

: it sub-species throughout the eastern 

: and Canada. The familiar 

: and warty of the skin of toads is 

: presence of glands and, especially on 

: to bony deposits. They are chiefly 

: ally and nocturnal, and feed upon in-

: which they destroy large numbers. 

: visit the water in March or April, their 

: season, for the purpose of depositing 

: , which are in long strings and are 

: by the male upon their extrusion. 

: mating season the males are very 

: : night and so pugnacious that they 

: l in another in their encounters, 

: :ment takes place rapidly and the tad-

: : ge is passed in three or four months. 

: ment the young toads leave the water in mul-

: : the popular repugnance to these per-

: : harmless animals has no doubt arisen 

: : their unprepossessing aspect and outward 

: : No venom or poison apparatus of 

: : any kind exists in these creatures; and save 

: : that the secretions of the skin may be of acrid 

: : or irratant nature when brought in contact with 

: : or exposed surfaces, they are utterly harm-

: : less to man. There is a swelling above the 

: : eyes covered with pores and large, three 

: : prominent enlargements behind the eyes which 

: : secrete an acrid fluid, which protects these 

: : animals from the attack of carnivorous mam-

: : mals. They also swell up with air when at-

: : tacked by snakes. When handled, toads fre-

: : quently eject urine from the vent, but the wide-

: : spread belief that the contact of this fluid 

: : with the skin produces warts is utterly un-

: : founded. Toads are extremely tenacious of life 

: : and can exist a long time without food; their 

: : hibernation in mud, cracks and holes has proba-

: : bly given rise to the stories of their being 

: : found in places where they must have existed 

: : for centuries without food and air. These 

: : stories, however, have no foundation in fact, 

: : for Dr. Buckland proved, by direct experi-

: : ment, that no toad can live for two years if deprived 

: : of food and air. Another common belief that 

: : toads are often rained down is probably to be 

: : explained by the fact that great numbers of 

: : young toads frequently leave, during showers of 

: : rain, the vicinity of pools in which their whole 

: : life was spent. Toads are really extremely 

: : interesting animals, and much entertainment 

: : can be derived from their observation.

: : Among foreign toads are the great Bufo 

: : aqua, large enough to fill a quart measure, of 

: : the West Indies and South America; the green 

: : toad (B. viridis) of Europe, noted for its 

: : change of color; the long-tongued toad (Rhi-

: : nophyamus dorsalis) of Mexico, which feeds on 

: : termites; the European fire-toad (Bombinator 

: : igneus), so called from its brilliant red under 

: : parts and belonging to the family Discoglos-

: : sidea; and the remarkable Surinam toads, which 

: : are tongueless and carry the young in little 

: : cavities on the back. The last belongs to the 

: : distinct family Pipidae. The spade-foot toad 

: : (q.v.) and the tree-toads or tree-frogs (q.v.) 

: : belong respectively to the families Scaphiopidae 

: : and Hylidae. Many of the toads have remark-

: : able and interesting breeding habits; four 

: : accounts of which reference must be made to 

: : works of herpetology. Consult Boulenger, E. 

: : G., 'Reptiles and Batrachians' (New York 

: : 1914); Cope, E. D., 'Batrachia of North 

: : America' (Washington 1889); Boulenger, G. 

: : A., 'Tailless Batrachia' (London 1892); Dick-

: :erson, M. C., 'The Frog Book' (New York 

: : 1914); Gadow, 'Amphibia and Reptiles' (New 

: : York and London 1901); Kirkland, 'Habits, 

: : Food and Economic Value of the American 

: : Toad' (in Bull. 6, Hatch Exper. Sta., Amherst, 

: : Mass. 1897); Sampson, 'American Naturalist' 

: : (1900).

TOAD-FLAX, a common roadside weed 

(Linaria linaria) belonging to the family 

Scrophulariaceae. It somewhat resembles a 

snapdragon, but is smooth and has many linear 

leaves, either alternate or opposite and vertic-

illate on the lower portions of the stem, and 

very pale green. The flower is produced by a 

terminal bracted densely flowered raceme. The 

blossoms are pale yellow with a short spur, a 

two-lipped corolla, the lower lip spreading and 

three-lobed, with a base so enlarged as nearly 

to close the throat with an orange-colored
TOADFISH. — TOBACCO

palate. This combination of orange and yellow has given rise to the name "butter-and-eggs." It is also called ramstead. The plant has been naturalized from Europe and is rather pretty, but it is very tenacious and very difficult to eradicate.

A native toad-flax is *L. canadensis*, a slender plant, with blue flowers and with a tendency toward oppositeness. The Kenilworth ivy (*Cymbalaria cymbalaria*) is also called ivyleaved toad-flax and is a glabrous trailing perennial with obovate leaves and bluish flowers. *L. triornithophora*, a European plant, is peculiar for its purple, long-spurred flowers blooming in whorls of three and resembling birds, which has suggested the Latin name *three-birds* toad-flax. The American bastard toad-flax (*Comandra umbellata*) is a delicate, pale green, smooth plant of the sandal-wood family, with greenish white or purplish, campanulate corollas and oblanceolate leaves, quite unlike the *Linaria*. In England *Thesium linophyllum*, with leaves like those of toad-flax, is known by the same name as *Comandra*.

TOADFISH, any fish of the genus *Batrachus*, so called from the large head, wide gape and generally toad-like appearance. The common toad-fish (*B. tau*) is from eight inches to a foot long, light brown marbled with black. There are about 12 species, dwelling principally in tropical and sub-tropical seas.

TOADSTONE, (1) in geology, an old English name for certain amygdaloidal basaltic rocks occurring in Cumberland, England. The name is also applied to a mottled, apparently spherulitic felsite, found near Boston. (2) Fragments of rocks or precious stones, resembling toads either in color or form, also fossils of various kinds, supposed to possess special therapeutic virtues. Such objects were for many centuries highly prized in Europe, being worn as rings or amulets.

TOADSTOOLS, properly fungi of the family *Agaricaeae*, which includes the edible mushrooms. See FUNGI.

TOASPERN, Otto, American artist: b. Brooklyn, N. Y., 20 March 1863. He was graduated at the Royal Academy of Fine Arts, Munich (1889); was the pupil of N. Gysis and P. Natier; and became an instructor in the National Academy of Design, New York. He is best known as an illustrator of *Life; Ladies' Home Journal; Century; Harper's* and several leading European periodicals.

TOAST, originally bread dried or scorched before the fire. In the 16th century it became the fashion in England to add toasted bread to drinks. From this habit the term toast came to be applied to a drink of honor proposed to some person or sentiment during the course or at the conclusion of a meal. The growth of social desire to greatly increased the custom of toasting, and it became common to toast not only the reigning monarchs, the hosts and the flag, but each person of the assembled company, absent friends and numerous distinctive names. The custom to denote not only the drink but the person or sentiment toasted, and in this dual sense the word is used to-day. Toasts are properly drunk standing, and it is the modern custom to have some person present reply to the sentiment proposed in an appropriate speech. (Her's "Book of Days" and Valpy's "Toasting" (1881).)

TOBACCO, the common name for the plants of the genus *Nicotiana* there are a large number of species. The dried leaves of these plants have various ways for smoking, chewing. Originating in America, the use of tobacco has been extended to practically all the world and, indeed, it has come comparatively the most generally used to plants. It appears that the name tobacco from the word *tabacco*, originally the natives of Haiti to designate by them in smoking or taking snuff by the Spaniards as the name of most generally used in smoking: alternative products than true tobacco were tatives in the form of snuff. The properties or narcotic effects of tobacco to its content of nicotine and related substances. The tobacco plant belongs to the Solanaceae and is thus related to potato, eggplant, red pepper and there are some 50 or more species, but only two of these, *N. taba- rustica*, are of economic importance. Indians of western North America held *N. quadriloba* in high esteeming purposes. Also, *N. sylvestris*, *N. tabacum*. This is a growing annual, reaching three to more in height. The leaves are nearly arranged on the stem, very quite varied in size, ovate to oblong, entire or with wavy margin, or sessile and decurrent. The number of colored petals is reduced to three and the flower is globular, secreting a viscid nectar. Stomata occur on both sur-

The inflorescence is a terminal, producing large flowers ranging in deep red through various shades of white, a light pink being the more common. Under favorable conditions, branches also develop from buds on leaf-axils. The calyx is five-lobed, four or five-cleft. The corolla is funnel-shaped with spreading and spreading. The blossom is normally self-fertile, bearing five stamens and six to eight ovules. The stigma is cam- sulate, usually two to four-valved, being a number of pod. The seed is 300,000 to 400,000 in an ounce. In numerous varieties the leading commercial varieties are white, yellow, and various other colors. Some of the leading commercial varieties have distinctive names but they themselves only in instances, however, important.
Tobacco are produced from mixtures of districts designated collectively by the type other than by distinctive varietal names. Notably true of Cuban and Turkish N. rustica is an annual with a much drier stem and large, ovate leaves with the corolla tube of the blossom is cal with rounded lobes and is greenish in color. The seed are about three size of those of tabacum. Rustica is earlier in maturing than is tabacum, grown commercially in America but widely cultivated in India and in certain of Asia Minor and Russia, and to some extent in European countries.

Tobacco was widely used by the 17th century in the New World by the American Indians, as well as by the Spanish and French. The Indians, who had been using tobacco for centuries, introduced it to the Spanish explorers, who then introduced it to Europe. Tobacco became a popular smoke item in Europe, and the first commercial tobacco plantations were established in Virginia in the early 17th century. By the 18th century, tobacco had become a major cash crop in the American colonies, and the tobacco trade became a significant factor in the economy of the United States.

At least four distinct varieties of N. tabacum were grown, viz: (1) A large broad-leaf type; (2) a long narrow-leaf "Ox-tongue" form; (3) a type resembling (2) but with broader leaves; (4) a type with very small leaves. Thus, prior to the settlement of Jamestown, the Spaniards and Portuguese had developed an important trade in tobacco between Europe and the West Indies and South America. John Rolfe began the culture of tobacco at Jamestown in 1612 from seed brought from South America or the West Indies and in 1619 20,000 pounds were shipped to England. The growing of tobacco in Maryland began about 1631 and soon became an important enterprise. These two States have continued to grow tobacco in large quantities up to the present day. The Virginia colonists at first grew the crop on the lower lands of the tribe-water region. As the settlers moved further inland, however, it was found that the more elevated and somewhat heavier soils produced tobacco better suited to trade requirements. The cultivation of tobacco became a serious menace to the welfare of the colonists and an inspection service was established in order to prevent the export of damaged or inferior leaf. Attempts were made also to limit the acreage grown but with indifferent success. It appears that the growers learned at a very early date the influence of the soil and the cultural and curing methods on the character of leaf tobacco produced. Thus, the selection of suitable soils, the proper spacing of the plants in the field, use of certain methods of manuring and following definite practices of topping, "suckering," harvesting and curing came to be recognized in the first few decades of practical culture as being of fundamental importance. In the main, present-day cultural methods, therefore, differ from those of the early colonists in details rather than in fundamental principles. The exports of tobacco from Virginia had reached 18,000,000 pounds in 1700, and about 40,000,000 pounds in 1750 while at the outbreak of the Revolution the combined exports of Virginia and Maryland amounted to 100,000,000 pounds. Prior to the Revolutionary War the production of tobacco in the other colonies was not of much importance, but during the period of the War an enormous expansion in total production in the United States. New centres of production were developed and the crop as a whole became differentiated into a number of distinctive types. After the close of the Revolution pioneer settlers from Virginia and Maryland carried the culture of tobacco into Tennessee, Kentucky, Missouri and Ohio. The tobacco produced in western Kentucky and Tennessee, however, found its way to market through New Orleans while the product of eastern Ohio was sent to Baltimore. Missouri at one time became a leading tobacco-producing State although in recent years the production has fallen off to a nominal figure. During the first quarter of the last century the culture of cigar leaf tobacco began to assume importance in the Connecticut Valley and by the middle of the century the cigar tobacco districts of the Miami Valley of Ohio, the Gadsden area in Florida and the New York areas had become established. Next came the development of the Homestead, Pa., district and, beginning about 1870, the
culture of cigar leaf developed very rapidly in southern Wisconsin. As tobacco culture in Virginia was pushed forward onto the gray lands of the south central border counties and into North Carolina a lighter-textured product was obtained. About 1825 began the use of charcoal in curing which had the effect of further improving the quality of the light-colored leaf and subsequently the charcoal was replaced by a system of flues for leading out the smoke and developing the fire and flue cured leaf in curing. In this manner began the development of the vast bright flue-cured tobacco industry. During the latter part of the century this industry spread into eastern North Carolina and South Carolina. Tobacco culture had been introduced into the Blue Grass region of Kentucky at an early date but the discovery of the White Burley variety in Brown County, Ohio, in 1864 revolutionized the industry in central Kentucky and southern Ohio. The Burley type soon came to be produced in enormous quantities. The outstanding event of the past quarter century in the industry is the development in the central Kansas Valley and in western Florida of the shade-grown cigar wrapper leaf industry, a very smokey leaf and highly specialized agricultural enterprise. Turning to the introduction of tobacco into foreign countries, it appears that the plant was first grown in France in 1556 by André Thevet from seed taken back by him on his return from Brazil. The plant attracted little attention, however, till introduced and exploited at the royal court by Jean Nicot, Ambassador to Portugal, whose name became immortalized in the generic name of tobacco, Nicotiana. Tobacco was also first grown in Portugal and in Spain at about this time, and almost immediately was introduced into England, the Netherlands and Rome. Upon his return to England from Virginia in 1655 Sir Richard Grenville introduced pipe smoking as practised by the Indians. For a full half century after this introduction into Europe tobacco was used almost exclusively as a medicinal agent and it was generally believed to possess wonderful curative properties. During the first half of the 17th century however, industry was station, and a portion of light-colored leaf. Its important characteristic, however, is its ability capacity for absorbing the liquid smoking materials or sauces used in the treatment of the sweetened type of plug chew. For this purpose the Burley has also been extensively used in the preparation of cut-plug smoking and fine-cut cigars and in the production of White Burley is grown chiefly on the third type of tobacco. It is our most important type. In recent years flue-cured leaf has become the world's most important type. In recent years flue-cured leaf has been used extensively in the production of granulated smoking materials or sauces used in the production of cut-plug smoking and fine-cut cigars. The bright flue cured type is probably the most extensively used in the domestic manufacture of cigars. There are three sub-types of cigar tobacco: (1) wrapper leaf used as the outer covering of the cigar; (2) binder leaf for holding the cigar's shape; (3) which makes up the body of the cigar. The leaf is grown chiefly in the Connecticut Valley, Long Island, New Jersey, and Gadsden-Deerfield district of Florida. Binder leaf is produced in New York. The leading centres for the production of filler leaf are in the Smoky Mountains of Pennsylvania, the Miami Valley district and the Onondaga district of New York. A dark fire-cured type is exported and is in fact a being unsuited for domestic manufacture in making snuff and for limited use as a wrapper. This type is grown in the counties of central Virginia, in the Hopkinson and Paducah districts of western Kentucky and Tennessee. Henderson or Newport district of Great Britain is the heaviest consumer of cut-plug smoking and fine-cut smoking materials or sauces used in the production of cut-plug smoking and fine-cut cigars. The bright flue cured type is probably the world's most important type. In recent years flue-cured leaf has been used extensively in the preparation of granulated smoking materials or sauces used in the production of cut-plug smoking and fine-cut cigars. plied to the crop. Barn manure, also, is widely used in Northern districts. Liming is less essential for tobacco than for many other crops though possibly beneficial under some conditions. The soil is tilled for tobacco about the same as for corn or cotton. When the flower buds begin to develop, or somewhat later, the plants are toped by breaking off the top of the stalk carrying the flower head and upper leaves, in order to force a better development of the leaves remaining on the plant. Cigar wrapper and binder tobaccos, White Burley and Maryland tobacco are topped high, leaving 16 to 20 leaves on the plant, while the heavy fire-cured type is topped to only 10 to 14 leaves and other types are topped to intermediate heights. The suckers or branches which develop in the axils of the leaf also must be broken off by hand. It is important to harvest the crop at the right stage of maturity. As the leaves ripen they take on a lighter green color and become more or less mottled with light-colored sticks. They also tend to crack when folded between the fingers. There are two methods in general use in harvesting the crop. In the first method the stalk is cut off near the ground and the inverted plants are attached to four-foot sticks either by means of cord or hooks properly spaced on the sticks, or by forcing the stick through the butts of the stalks by means of a removable metal spear head, or, finally, by splitting the stalks from the top near the base and simply placing the plants astride the sticks. Each stick carries six to 10 plants and thus laden the sticks are arranged 6 to 12 inches apart on the tier poles of the barn. In the second method the leaves are plucked from the plant as they ripen, beginning at the bottom and taking two to five leaves at each picking. The field is thus gone over three to five times at intervals of a week or 10 days. The leaves are strung on cord by piercing the base of the midrib with a needle or the cord is merely looped around the basal ends of the leaves. The free ends of the sticks are arranged 6 to 12 feet of a four-foot stick, each stick and cord carrying 20 to 40 leaves. Curing, which must be carried out under proper conditions of temperature and moisture supply, is effected in specially constructed curing barns. Three of these methods are commonly practised, known as air-curing, flue-curing and fire-curing. In all cases the process must be so regulated as to develop the desired properties in the tobacco leaf. In air-curing natural atmospheric conditions are largely depended upon and little or no artificial heat is employed. The barns are comparatively large and are provided with a maximum of ventilation. From three to 12 weeks are required to complete the process of air-curing. This method is applied to all cigar tobaccos, Maryland tobacco, White Burley and the dark manufacturing types. For flue-curing the barns are small in size, tightly constructed and are provided with a system of metal pipes by means of which artificial heat may be freely applied with the smoke from a large oven or several small ovens. The tobacco Heat is applied throughout the curing and the temperature is carefully maintained, beginning with 100°F and ending with 200°F. The whole process is conducted in the sticks to be hung on the floor of the barn, thus allowing the smoke to come in contact with the tobacco, to which it imparts a characteristic odor. The barns should be tightly constructed but should be provided with ventilators. In practice heat is applied until the tobacco has been hanging in the barn for three days and the fire is kept going for only a few days at a time. Any warm per- iod of the air-curing and firing are thus continued till the curing process is completed. After curing in the barn is completed the tobacco leaf is too brittle to handle without breaking except after a period of damp weather or when moisture is applied artificially. Under suitable moisture conditions the leaf becomes pliable so that the crop can be handled in preparation for market. After the leaves have been stripped from the stalks they are separated into various grades according to size, color and other important elements of quality. The number of grades made by the grower ranges from two to 10 or more, according to the type and value of the crop. After the grading is completed the leaves are tied into bunches by securely wrapping a folded leaf around the butt ends of the leaves in the bundle. There are several different methods of marketing the various types of leaf tobacco. In the case of cigar tobaccos, and to a limited extent, the dark air-cured and fire-cured types, the buyer inspects and bargains for the crop on the farm, the grower delivering the tobacco at the buyer's receiving warehouse. In the South and, to an increasing extent, in the Western districts the "loose leaf auction system" prevails. Under this system the various grades of the grower are placed in separate lots on the warehouse floor at market centres and sold at auction on a commission basis. In a third system which has been extensively employed, the tobacco, put up in standard containers, is sold from carefully drawn samples without the buyer having seen the contents of the package until delivery has been effected. The sale is made either by auction or by private bargaining. There are three standard containers in which leaf tobacco is delivered to the manufacturers, namely, the box or case, the bale and the hoghead. Cigar tobaccos are packed in cases and bales and Turkish tobacco, also, is packed in bales, while the bulk of other tobaccos is packed in hogheads. In all cases, after having been packed, the tobacco goes through an important fermentative or aging process which develops the aroma and otherwise improves the quality. In some cases, however, the tobacco is put through a preliminary, more active fermentation in large heaps or bulks before it is packed for storage or transportation. The extent or degree of the fermentation is controlled largely by regulating the moisture contents of the tobacco. The tobacco plant throughout its period of growth is subject to injury by numerous insect pests and parasitic diseases. Among the more important insect enemies are the cutworm, wireworm, flea-beetle, hornworm and budworm. The cutworm is the worst best controlled by rotation of crops and the hornworm and budworm by the use of arsenical insecticides or by hand picking, while no effective remedy has been found for the flea-beetle. The tobacco beetle is a serious pest in all forms of cured leaf and
The production of tobacco in the United States by types for the year 1918 is found in Table III.

The present normal production of tobacco in the United States is placed at 1,150,000,000 pounds, grown on 1,400,000 acres and having a farm value of $1,380,000,000. Nearly all of this crop is grown in 15 States. Kentucky produces fully a third of the entire crop and Virginia and North Carolina together produce nearly another third. Lancaster County, Pa., with a production of nearly 40,000,000 pounds, is the largest tobacco-growing county of the United States. The crop as a whole is made up approximately of 28 per cent flue-cured, 25 per cent White Burley and 20 per cent each of cigar leaf and the dark fire-cured export type, the remainder consisting of Maryland export and dark-air-cured manufacturing leaf. Considerable quantities of fine cigar and cigarette leaf tobacco are imported into the United States from foreign countries and shipped in from non-contiguous territory. The imports for 1914 as given in Table IV may be taken as representing approximately the normal pre-war import requirements of the tobacco industry. The war proved a disturbing factor in the tobacco trade and while the demand was greater than ever before it was not reflected in the imports.

From the earliest days of the colonies, tobacco has always been an important article of export in the international trade of the United States. For many years Great Britain has been the heaviest foreign purchaser of American tobacco. Statistics for the years 1914 is taken as indicating the normal distribution of our exports of leaf tobacco. The data are shown in detail in Table V.

The international trade of the United States in tobacco manufactures, also, is considerable, the chief items being the imports of cigars from the Philippines and Cuba and the exports of cigarettes to Asiatic countries. In 1913 the imports of Manila cigars were, in round numbers, 200,000,000, worth $3,863,000. The normal imports of cigars from Cuba amount from 40,000,000 to 45,000,000 annually, valued at $3,500,000 to $4,000,000. Approximately 175,000,000 cigars are shipped into continental United States each year from Porto Rico and these cigars are valued at about $6,500,000. Nearly 5,000,000,000 cigarettes, having a value of $7,000,000 were exported to China in 1917 and in 1918 the number had increased to some 7,500,000,000, worth over $12,000,000. More than a billion cigarettes, also, are exported annually to the Straits Settlements. Total exports of plug tobacco and smoking tobacco amount to some 5,000,250,000,000 pounds, respectively. Our trade in cigars is of little importance. It remains to consider the quantity of tobacco consumed in domestic. The quantities thus used in the manufacture of cigars, cigarettes, smoking and chewing tobacco and snuff are shown in Table VI. They are based on reports of the Internal Revenue Department, not include the use of leaf tobacco consumed in bonded warehouses. The tobacco consumed in these establishments in 1917 amounted to 18,000,000,000 pounds.

The output of the various factories producing leaf tobacco consumed as set forth in Table VII. In addition to leaf tobacco large quantities of licorice and other materials are used in the manufacture of cigarettes. Figures show more or less of an increase from year to year in the use of cigarettes. In addition to the quantities in Table VII, which are based on reports of the commissioner of internal revenue, the forms of tobacco were manufactured to extent in bonded manufacturing war. There were thus manufactured in 1913, 662,940 cigarettes and 87,654,199 cigars, a total output of 29,907,140,551 cigars, 8,020,264,340 cigars for that year. The indicated total of cigarettes manufactured in 1917 is in excess of 40,000,000,000.

In 1914 there were 13,951 establishments with a capital of $303,840,000, engaged in tobacco manufacture in the United States and wages paid to 195,694 engaged in the industry amounted to $69,944,000. The total value of manufacture was $490,165,000. Manufactured tobacco is an important source of government revenue.

Wightman W. Garner, Physiologist in Charge of Tobacco Investigations, Bureau of Plant Industry, United States Department of Agriculture.

TOBAGO, tō-bā'gō, British West Indies, an island of the Lesser Antilles, situated 20 miles northeast of Trinidad. It is about 24 miles long by seven miles wide, with an area of 114 square miles. It is hilly, rising at one point to a height of 2,000 feet. The soil is fertile and well cultivated. The chief products are sugar, rum, coconuts, rubber, cacao, cotton and tobacco. The capital and chief port is Scarborough, on the south coast, where steamships to Guiana make stops. The island has been in British possession since 1814 and in 1889 it was united with the colony of Trinidad. Pop. about 21,000.

TOBACCO, a meat sauce made of peppers, originally manufactured in Louisiana by Col. John McIlhenny in 1808.

TOBIKAR, tō-hik-hār'. See Smokho-nean Indians.

TOBIT, Book of, one of the Old Testament books rejected as apocryphal by the Jews and Protestants, but received into the canon by the Roman Catholics. It contains an account of some remarkable events in the life of Tobit, a Jew carried captive to Nineveh, and his son, who is named Tobias. Ewald ascribes the book to a Palestinian Jew who wrote in Hebrew, and suggests as the date of its composition the middle of the 4th century before Christ. The earliest known text is in Greek. See Bible.

TOBOGGAN, a sled-like vehicle, often formed of a single piece of broad flat wood, of birch or balsam, curved up and backward at the front end, and used for sliding down slopes of snow. It is commonly from five to eight feet long, about 15 or 16 inches in width if formed of one piece, or wider if formed of two or more. The curved portion in front is usually fastened by thongs of hide or gut, and the toboggan is strengthened by cross-pieces of hard wood strapped to the body at short distances. Toboggans originated with the Indians, who used them for hauling packs over the snow, and the name is still applied to a class of sleds drawn by dogs. But the toboggan of to-day is chiefly used in the sport of coasting down prepared slides, a popular pastime in Canada and other countries in high latitudes.

TOBOL, tō-bōl', Asia, a river of Siberia, tributary to the Irtysh, which rises in the southern Urals, in Russian central Asia, flows northeast, and after a course of 750 miles empties into the frozen Ob, a tributary of the Yenisei. The river is navigable for more than half its length, but is covered with ice from November to May; its chief affluents are the Uj-Iset, Tura and Tawda. The Trans-Siberian Railway crosses the river at Kurgan.

TOBOLSK, tō-bōlsk', Asia, in Siberia, (1) capital of a government of the same name, on the Irtysh where it joins the Tobol, about 350 miles northwest of Omsk. The principal buildings are the churches, government's residence, bishop's palace, municipal offices, arsenal, barracks, bazaar and hospital; beside the river is a depot for Siberian exiles, assembled from all parts of the country, an episcopal seminary, theatre, gymnasium, etc. The manufactures include bricks, soap and tallow. The trade is unimportant. The town is partly fortified. Pop. 25,200. (2) The government of Tobolsk, in northwestern Siberia, contains an area of 535,739 square miles. The Arctic Ocean borders the northern coast; the principal rivers are the Obi and Irtysh, which are navigable when not frozen over. The chief occupation of the inhabitants is agriculture and cattle-raising; fishing and hunting in the north. Pop. 2,885,700.

TOCANTINS, tō-kän-tēnz', Brazil, a river rising in the southern part of the state of Goiás, and flowing north through Goiás, the Paraná and Paraguay, it emptying into the Atlantic Ocean through the Rio Pará, the southern estuary of the Amazon delta. On the northern boundary of Goiás the river receives from the left the Araguaya, which is considerably larger than the main stream. From the source of the Araguaya in the Cayapo Mountains in Matto Grosso to the Atlantic Ocean is fully 2,200 miles, constituting one of the great rivers of the world. The Tocantins is 1,600 miles long, and though interrupted by falls and rapids, it is navigable in stretches aggregating 1,100 miles. Its estuary is 140 miles long, and receives numerous channels from the Amazon, together with which it separates the island of Marajó from the mainland. The country through which these great twin rivers flow is undeveloped, there being not a single important city on the banks, except Pará at the mouth.

TOQUEVILLE, tōk'vīl (Fr. tük'vel), Alexis Charles Henri Clérel de, French statesman and writer: b. Verneuil, 29 July 1805; d. Cannes, 16 April 1859. He was originally destined for the military profession, but exchanged it for that of law. In 1827 he was appointed an assistant magistrate at Versailles. In 1831 he was commissioned by the French government to proceed along with his friend, M. Gustave de Beaumont, to America, and to
investigate and report upon the penitentiary system of the United States. The results of the inquiry were published in 1833 under the title 'Du Système Pénitentiaire aux États-Unis et de son Application en France.' This, however, was only the precursor of the greater and more notable book 'La Démocratie en Amérique' (1835), to which the Montyon prize of the French Academy was awarded in 1836, and which, by 1850, had run through 13 editions. It was the first systematic analysis of democracy as exemplified in the institutions and political relations of the United States, and was translated into the principal European languages. Tocequeville was in 1839 elected to a seat in the Chamber of Deputies, and ranged himself with the opposition. After the Revolution of 1848 he was nominated deputy from the department of La Manche to the National Assembly, where he voted always against the propositions of the ultra-democratic party. In the spring of 1849, he accepted the portfolio of Foreign Affairs, but resigned it the same year, after holding it for five months. After the coup d'état of 2 Dec. 1851, he lived retired from public affairs, and devoted his leisure to the production of 'L'Ancien Régime et la Révolution,' published in 1856. His complete works appeared in 1860-65. Consult Jaquez, 'Alexis de Tocequeville' (1876); 'Souverains d'Alexis de Tocequeville' (1893); and D'Echialat, 'Alexis de Tocequeville et la Démocratie Libérale' (1897).

TOCSIN, a bell sounded with quick strokes for the purpose of attracting attention. The word is derived from the French, and the use of the tocsin as a signal to arouse the people was so common during the French Revolution that the word has come to be proverbially used for any loud sound or call marking the commencement of an important event.

TODAS, or TUDA, a singular race of people inhabiting the upper part of the Neillgherry Hills in southern India. They are pastoral in their habits and possess a queer unwritten language. Their religion is the worship of the sun and of departed spirits. They form a small polyandry in both its forms — the brothers of one family having one common wife, yet receiving the right, at certain seasons, of temporary husbands to the women of the subject villages. They are a tall, well-proportioned and a fine muscular race of men, are dominant over the neighboring tribes and receive from them a "goodoo" or tribute of one-sixth of their crops, the Todars holding aloof from tillage of the soil. They have slowly increased in number since 1858 when a census of 1877 gave a recent estimate placing their number at 750.

TODD, Alpheus, Canadian author and librarian: b. England, 1831; d. Ottawa, Canada, 22 Jan. 1884. He removed with his parents to Canada in 1833; was for some time assistant librarian of the legislative assembly of Upper Canada, and in 1850 he became chief librarian. Upon the Confederation he was appointed to that office with the Dominion Parliament. He was also a writer of high authority on constitutional law and Parliamentary government. Author of 'The Practice and Privileges of the Two Houses at Toronto' (1839); 'Parliamentary Government in England' (2 vols., 1858-69), etc.

TODD, Charles Burr, American author: b. Redding, Conn., 9 Jan. 1849. He received his education in the public schools. For many years he was special writer on the New York Evening Post. In 1895 he was secretary to the commission appointed by New York to publish the early records of New York City. His published works are 'History of the Burr Family in America' (1879); 'History of Redding, Conn.' (1880); 2d ed., 1901; 'Life and Letters of Joel Story of the City of New York' (1895); 'Story of Washington, the National Capital' (1897); 'Lance, Cross and Canoe in the Valley of the Mississippi,' 'Brief History of New York' (1899); 'The True Aaron Burr' (1903); 'The Real Benedict Arnold' (1904); 'In Old Connecticut' (1905); 'In Old Massachusetts' (1907); 'In Old New York' (1907); 'The Washington Crossing Sketch Book' (1914); 'Sketches of the Delaware Valley' (1916).

TODD, David, American astronomer: b. Lake Ridge, N. Y., 19 March 1855. He graduated from Amherst in 1875 where he became professor of astronomy in 1881. From 1882 to 1897 he held a similar post at Smith College. In order to make astronomical observations he has conducted expeditions to Texas in 1878, transit of Venus, Lie Observatory 1882, to Japan in 1887 and again in 1896, to West Africa in 1889-90, to Tripoli, Barbary, in 1900 and 1905, to the Dutch East Indies in 1911, to the Andes of Chile, and Peru in 1908 and to Russia in 1914. He is the author of several textbooks on astronomy, also 'Stars and Telescopes' (1899); 'Lessons in Astronomy' (1902), also articles in magazines and reviews.

TODD, Henry Alfred, American philologist and educator: b. Woodstock, Ill., 13 March 1854. He was graduated at Princeton University in 1876 and later studied at the universities of Paris, Berlin and Madrid, taking his Ph.D. at Johns Hopkins University in 1885. He was professor of Romance languages at Leal Stanford University, not of polyandry in 1883-85; in 1893 he became professor of Romance philology at Columbia University. He was one of the founders of the Romance Review in 1910; was a member of the advisory council of the Simplified Spelling Board; and in 1906 was president of the Modern Language Association of America. He has edited numerous volumes in the Romance languages.

TODD, Mabel (Loomia), American author: b. Cambridge, Mass., 10 Nov. 1858. She edited the 'Poems' (1890-96) and 'Letters' (1894) of Emily Dickinson and a 'Cycle of Sonnets' (1896) by an anonymous author; also Sted's 'Popular Astronomy' (1899). Her original writins include 'Total Eclipses of the Sun' (1894) and 'Corona and Coronet' (1898); 'A Cycle of Sunsets' (1907). The traditional tale of the Ainu aborigines in Kitami province, Japan, appeared in various magazine articles.

TODD'S TAVERN, Engagements at. The Virginia campaign of 1864 began on 4 May by the advance of the Army of the Potomac across the Rapidan, the cavalry divisions of Generals Gregg and J. H. Wilson leading.
crossed the Rapidan at Germania Ford, arched rapidly by Wilderness Tavern to 's Store, from which he sent a recon- nance toward Mine Run, the rest of his n going into bivouac. During the night s ordered by General Meade to advance direction of Great Chalmette, from the heights on the one nt to hold Parker's Store. Just beyond Church Wilson encountered Rosser's ferate cavalry, which was driven back iles, and at noon, as he had heard noth- the approach of Meade's infantry. On m position was threatened, he began to aw to Parker's Store, when he heard that giment left there had been attacked by ferate infantry, and that he was cut off communication with General Meade's in- He determined to withdraw on the pin road, by way of Shady Grove Church, d's Tavern, on the Brock road. Very in the morning of the 8th Gregg was put tion to guard the roads from the south erritt's division renewed the engagement hugh Lee on the Spottsylvania Court road to open the way for the advance erritt's field troops from Todd's Tavern Court House. Merritt became severely 1, but slowly gained ground until about when he was relieved and Robinson's of Warren's corps took the advance. Ke's Sharp-shin corps, following Warren's Todd's Tavern at 9.30 A.M., and took covering the Brock road, Catharpin and Ixonia roads, and began to intrench, the extreme right of the army. At 11.30 A.M. Gen. N. A. Miles' brigade, with Gregg's cavalry brigade and a battery, moved out on the Catharpin road toward Corbin's bridge, and when half a mile from it one and one-half miles from Todd's Tavern, the head of column was opened upon with artillery from the south side of Po River. Miles formed line, his artillery replied to that of the enemy, there was a skirmish with Wade Hampton's cavalry, which was kept at bay, and at 5.30 P.M., when Miles began to withdraw, he was attacked by Mahone's division of in- fantry and fell back fighting to Todd's Tavern. Consult 'Official Records' (Vol. XXXVI).

E. A. CARMAN.

TODY, or PALM-WINE, a drink made in tropical countries from the sap of various palms, especially when in a fermented state. The word is of Hindustani origin and is generally applied in India to the substance used yeast to leaven bread. In the Malayan Archi- pelago, tody is the sweet juice of the flower sheaths of Arenga saccharifera. In Brazil the majestic buriti, or muricil palm (q.v.), is felled, and cavities are dug in the stem in which to collect the sap, from which a fermented liquor is made. This has led to the use of the name of wine-palm for this tree. The spadix of the useful Nipa frutescens yields tody which is changed into vinegar by one process, into arrack by another and may also be con- verted into a delicious syrup, thick, frothy and clear, with a slightly saline flavor. Sugar is made from this syrup by evaporation. The tody or jaggery-palm (Caryota urens), a palm crowned by drooping bipinnate leaves, with wedge-shaped leaflets, furnishes a similar sap when the flowering stems are cut. This, like that of the nipa, can be boiled down into syrup and will yield a coarse brown sugar known as jaggery or goor. The sap is fermented for the tody and further distilled for arrack. The cocoaanut (Cocos nucifera), the palmyra palm (Borassus flabelliformis), the date (Phalix dactylifera), and the wild date (Phalix sylvestris), all yield toddy in India, the latter being grown extensively in Burmah. Arrack is made of this drink and the sugar extracted from it; it is said that the sap can be induced to flow from the upper portion of the stem for many years. The West Africans make their tody from Raphia vinifera.

The word tody was applied by the Scots to a drink made of whisky and hot water, sweetened. Burns uses the term in 'The Holy Fair.' Whisky and cold water, properly called grog, is also known by this name, Toddy-Cat is the name given in southern India to the palm-civet on account of its alleged fondness for palm-juce.

TOODY-BIRD, a swallow-shrike (Artamus fuscus) of India and Ceylon. It is about seven inches long, of dusky plumage and is most abundant in wooded districts, especially where palm trees abound, more particularly in the Palmyra or toddy palm, from which it takes several of its popular names.

TOODY-CAT, one of the civets (Paradoxurus typhus), common throughout the greater part of India, Ceylon, Burma and the Malayan region, which dwells mainly in the Palmyra or toddy palm-groves. See Toddy.
TODHUNTER, Isaac, English mathematician: b. Rye, 1830; d. Cambridge, 1 March 1884. He was graduated from London University in 1842 and from Saint John's College, Cambridge, in 1848. He was elected a Fellow of his college in 1849 and became a lecturer and tutor. He was elected a fellow of the Royal Society in 1862. Todhunter was a man of high attainments in various branches of learning, but is best known as the author of numerous mathematical textbooks. His most important works are 'Treatise on the Differential Calculus' (1852); 'Analytical Statics' (1853); 'Plane Co-ordinate Geometry' (1855); 'Examples of Analytical Geometry of Three Dimensions' (1858); 'Algebra' (1858); 'Trigonometry' (1859); 'The Theory of Equations' (1861); 'History of the Progress of the Calculus of Variations during the 19th Century' (1862); 'The Laplacean Mathematical Theory of Probability of Pascal and Laplace' (1865); 'History of the Mathematical Theories of Attraction from Newton to Laplace' (1871); 'The Conflict of Studies' (1873); 'Laplace's Functions' (1878); and 'History of the Theory of Elasticity' (ed. Karl Pearson 1886).

TODHUNTER, John, Irish poet and dramatist: b. Dublin, 30 Dec. 1839. He was educated at Trinity College, Dublin, and after studying at Vienna and Paris, practised medicine for some years in his native city. He was professor of English literature at Alexandria College, New York, 1870-74, and later removed to London. He has published among other works 'Laurel and Other Poems' (1876); 'Alcestis' (1879); 'A Study of Shelley' (1880); 'The Banshee and Other Poems' (1888); and several plays, such as 'Helena in Troas' (performed 1886); 'The Prison Flower' (performed 1891); 'A Comedy of Sights' (performed 1894).

TODELEBEN, to-dë-lë-bën, or TOTLEBEN, Franz Eduard Ivanovitch, Count, Russian general: b. Mitau, Courland, 20 May 1815; d. Soden, Germany, 1 July 1884. He studied at the artillery school of engineers at Saint Petersburg, and entered the Russian army during its operations against the Circassians in 1845. Having been recognized as a most able engineer in this campaign, he was sent to the Crimea in 1854, where he distinguished himself while under constant fire from the guns of the enemy in the rapid conversion of the city of Sevastopol into a formidable fortress. For this and other valuable service during the Sevastopol campaign he was promoted to the rank of general. At the close of the Crimean War he retired into private life, where he devoted himself to scientific investigation and to the writing of a history of the war. During the Russo-Turkish War of 1877 he was sent to Plevna, where he compelled the commander, Osman Pasha, to surrender his entire army to the Russians. He was afterward made commander-in-chief of the army at Constantinople. At the end of the Russo-Turkish War he entered political life, and was in his later years governor, first of Odessa, and then of Sevastopol. He published an account of the defense of Sevastopol (French Trans., 'Défense de Sevasto- pol,' 1804); Consult Kinglake, 'The Invasion of the Crimea' (1863-87); Brialmont, 'Le général comte Todeleben' (1884); Krahmer, 'Generaladjutant Graf Todeleben' (1888).

TODMORDEN, tod-môr'den, England, town in Lancashire and Yorkshire, on the Oder, 21 miles northeast of Manchester. The churches of various denominations, town-hall, free library, technical school, etc., are the chief buildings. The industries consist of foundry, machine works and factories for coal-goods. Pop. about 26,000.

TODY, a term applied to a family (Todidae) of birds closely related to the moorhen and kingfishers. They are distinguished by a long flat bill, short and rounded wings and a short and square tail. Only four species are known, all of small size, and inhabitants of tropical America. The green tody (Tody rufa) of Jamaica is about four inches in length and green on the upper parts, the flanks reclad, the throat scarlet and the belly yellow. The bill is red. It frequents the coasts and watercourses, and has the habit of flying-catcher, taking short flights in pursuit of insects and returning to the perch by a direct route in the manner of kingfishers, in holes excavated in banks, and lay three or four white scutellar eggs. Consult Evans, 'Birds' (New York 1900).

TOFT, an old English word denoting a thicket of trees, or a homestead or a pier on which a messuage or home stood. Taken in the second sense it is frequently used in legal papers in conjunction with the word coft, "toft and coft" mean a house and homestead, with the stable aoutholding, the well and an enclosure. Probably from the fact that the house was usually surrounded by trees on the latter meaning of soft, which is present in the modern word tuft, a grove of trees.

TOGA. See Costume.

TOGO, Heihaichiro, Count, Japanese miral: b. Kagoshima, Japan, 1847. He early became known as one of Japan's most promising naval officers and a few years before the annexation of the Hawaiian Islands by the United States, he was sent to Hawaii to command the battleship 'Maine' to protect Japanese who were then complaining of persecution by the government. There he became involved in warfare with United States ship 'Boston' whose captain supported the demand of the Hawaiian government for the surrender of an escaped Japanese prisoner, a threatened to fire upon the 'Maine.' When Togo immediately cleared his ship for action however, the captain of the 'Boston' apologized and withdrew his threat. In 1894 Togo practically began the war with China by firing upon Chinese transports carrying troops with an evidently hostile purpose. On the breaking out of the Russo-Japanese War in 1904 he was appointed commander-in-chief of the Japanese navy and conducted the operations against Tsushima, and the bombardment of that port. He defeated the Russian fleet there, driving it back to the shelter of the Russian inner harbor, and damaging several Russian ships. On 27-28 May 1905 he met and annihilated the Russian Baltic squadron, only to small cruisers and some torpedo boats esc.
GOLAND, Africa, a territory on the f Guinea, between French Dahomey and its Gold Coast, held as a German col-

umn 1894 to 7 Aug. 1914, when it was oc-

cupied by British and French troops. Ac-

tween Germany in 1913 was over 100. It has a coast line of 32 miles, but 325 miles inland, where it becomes r. Area, 33,630 square miles. Lome is ef port and capital. The coast is low

order by lagoons, but the interior is

by the escarpment of the Sudan Pla-

The country is well watered, the interior

ches of the Volta, which forms the west

ry. The chief products are palm oil,

rubber, indigo and dye-woods. Cattle

is carried on by many of the natives.

also do weaving, make pottery and mine

nothing but a little iron. The inhabitants, who are about 2,000,000, are ethnic negroes, the

anterior population being less than 400.

ce is rapidly increasing, and there is

steamship connection with Europe.

GUE, a local name in Maine for the

ot (q.v.).

ILERS OF THE SEA ("Les Travail-

le la Mer"), a novel by Victor Hugo,
ed in 1856. The scene is laid in the 13th, and the book is dedicated to

de of Guernsey, severe yet gentle, my

asylum, my probable tomb."

ISE, toiz, in the French system of mea-
sed previous to the decimal system, was
t of linear dimension. It consisted of six

feet, each of which was composed of

ces or inches, each pouce being divided

lignes or lines. The toise was thus the

ent of 1.94904 + metres or of 6.3946 +

feet.

KAT, tóká’t, Asia Minor, a town in

yet of Sivas, 70 miles from the Black

textures between steep rocky walls in a th

of narrow streets bordered by miser-

ess. It contains a large mosque, ba-

foundries and manufactories of carpets,

ool and cotton goods, etc. Copper is

in the vicinity. The town was formerly

ous, but ill treatment of the Armenian

ion has largely reduced its inhabitants,

l to number about 22,000 in 1919.

KAY, tóká’ (Hungarian, tókoi), Hun-

a Semplin County, at the junction of the

an Bodrog, 130 miles northeast of

buildings include a theological semi-

corium, high school, etc. In the or-

hood are rich mineral deposits, as salt,

es, etc. The chief occupations are agricul-

ture, viticulture and timber trade.

ay wine is famous, and the best is pro-

on the hill of Mezés-Máli. Great care

cised in the culture, gathering and selec-

t the grapes. The wine is of various

es, dependent finally upon the amount or

artificial pressure. The best kinds are

ce and the Ausbruch, of amber color

every year about 1,300 varieties are pro-

es, grouped as sweet and dry; 2,000,000

are produced, but the celebrity of the

such that many imitations are made by

French and German dealers, which are even

sold in Hungary. Pop. 5,500.

TOKEN MONEY, a name in numismatics

plied to pieces of money current only by

suffrance and not coined by the authority of

state or governors in England. In the late 16th century the national coinage was so

satisfactory and inconvenient that large num-

bers of private traders and merchants were im-

elled to have halfpence and farthings manu-

factured for themselves. These "tokens" they were called, were made of lead, pewter,

latten, tin and even leather, and could only be

made of as currency at the shops or ware-

houses of their respective issuers. Notwith-

standing the endeavors made during several

regains to put a stop to the circulation of this

unauthorized coinage, traders' tokens continued to multiply to an astonishing extent, until, in

1672, a proclamation was issued, prohibiting their making or use under severe penalties. From that date until 1787 the issue of private

tokens entirely ceased; but in the latter year,

owing to the great scarcity of government cop-

coins, the Anglesey Copper Mines Company

and put into circulation some 300 tons of copper pence and halfpence. The boldness of this

ample thus set was speedily followed by other

trading firms all over the kingdom, and again

the government found it necessary to take action

in the matter, which it did by issuing a new na-

tional copper coinage. For some years the issue of private tokens was thus effectually checked;

but in 1811 the authorized coinage again getting

scarce, the copper companies and others recom-

mended the issue of batches of tokens. This

went on until 27 July 1817, when the manu-

facture was prohibited by act of Parliament,

and all the tokens in currency ordered to be with-

drawn from circulation by 1 Jan. 1818.

In the United States small coins became so

scarce in 1862 that tokens made their appearance in large quantities. They were of two

classes, war or patriotic tokens, and trade or advertisement tokens. Both kinds were issued

with a mercantile or home, since they passed for a cent and could be manufactured (in sufficient

quantities) for much less. Such tariffs and tokens appeared during 1862, 1863 and 1864. Of

the patriotic or war tokens there were something like 400 varieties coined, including mulings

and different metals, the latter largely restrikes. Of

original pairs of obverse and reverse there must

have been less than 200. The common varieties bore the inscriptions "Army and Navy,"

and "Not One Cent." The first coinage of trade

tokens, or store cards, as they were sometimes

called, took place in Cincinnati where nearly 900

varieties were issued, fully three times as many

varieties as any other city issued except New

York. A number of other Western cities soon

followed the example of Cincinnati, but it was

not until the early part of 1863 that New York

began to issue the famous Lindenmuller cents,

of which there were more than a million

coined; these were followed by the Knicker-

bocker tokens, consisting of many varieties.

Altogether there were between 700 and 700

varieties issued from New York. Ohio issued

about 1,300 varieties from 100 different cities

and towns, more than any other State issued;

New York State comes next after Ohio, with

over 900 varieties. New Jersey had but few,
and Pennsylvania not many; chiefly from Philadelphia and Pittsburgh. Detroit furnished as many advertisers as New York, and the rest of Michigan nearly as many as Cincinnati. Indiana had about 100, Illinois, including Chicago, not as many as Indiana; and Wisconsin nearly twice as many. When the government stopped the coining of tokens in 1864 there were upward of 20,000,000 in circulation.

TOKIO, トキョー, or TOKYO, the capital of Japan, situated at the head of the land-locked Bay of Tokio, on the east coast of central Honshu, and at the mouth of the Sumida Gawa. Besides the latter river, which divides the city into two unequal parts, Tokio is intersected by a large number of canals, which are generally crossed by wooden bridges. Some of the canals form concentric courses, enclosing a number of islands, one within the other; and on the innermost of these stands the imperial palace. This large cluster of buildings is surrounded by magnificent gardens, and enclosed by high walls and towers. The outer islands are most of the government departments and foreign legations. Surrounding these central islands, the city spreads out on all sides, with a rather irregular and complex street plan. There are numerous parks in and around the city, some of them being large and beautiful. Practically all the houses are built of wood. Besides the palace the only notable buildings are some of the numerous temples, especially that of Kanonji, and the temple of the Shoguns. There are six European churches, the finest being the Russian cathedral. Tokio contains about 70 hospitals of good standing, including the Komagome Hospital for epidemics and the Tokio Charity Hospital. The former is supported by the city and the latter by the imperial Court. There also exists an asylum for orphans of the poor, established by the city. According to the latest returns on educational affairs there are about 500 public and private primary schools and kindergartens. The number of children of school age is about 225,000 of whom about 80 per cent are in attendance. There are 35 middle schools, public and private, of which six are for girls. The schools have no religious instruction given under the direct control of the Department of Education number 13, including the Imperial University, the First High School, the Higher Commercial School, School of Foreign Languages, the Tokio Higher Technical School, Higher Male Normal School and Higher Female Normal School. Besides there are two public normal schools, supported by the Tokio Prefecture. The keigakukai, Waseda and Women's University are most prominent among the private high class institutions, among which are included 10 other colleges of law, economics, philosophy and religion. In addition to those above mentioned, there are over 280 public and private schools, mostly of the middle school grade, teaching special subjects. The city has a number of libraries opened to the public, including the Imperial Library at Uyeno Park. The sanitary condition of the city is in a fair condition, though street drainage is not so well advanced as in Western countries. Each ku (ward) has a sanitary section supported by rate levies from the inhabitants thereto. The metropolis is well supplied with parks and open spaces. The largest parks are Uyeno and Hibiya parks. In the first two, beautiful temples connected with the kugawa family, and here the remains of Shoguns are buried. At Uyeno the Imperial Museum. Automobiles have been introduced as a means of transportati "autobus" line is in operation, in 1920 the electric tramways. Streets are not regularly laid out, but new buildings are being erected. Great harbor have been undertaken by the municipal Corporation at a cost of 37,000,000 yen. There is modern water-supply system, excellent railways, gas and electric light, mac roads, public works, etc., all carried on ing to methods of civilized cities all over world. The municipal council is elected by the city and county, and the latter is the popular vote. Although the prime centre of the empire, Tokio is no dispensary manufacturing or commercial city. It is Yokohama, near the entrance to the city was founded in 1450 and became the capital of the Shoguns residing at Kioto. The center of the Shoguns in 1868, Tokio (still known as Yedo) became the residence of the and the sole capital. It has several suffered from earthquakes and fires. Popp. 2,244,796.

TÖKÖLY, 토케리, or TÖKELY, 토끼, COUN, Hungarian patriot. See The University of Budapest.

TOKUGAWA, Prince, Japanese statesman and political leader, known as "father of the Tycoonos." See Hiroro Kasaishi.

TOKUSHIMA, 토쿠슈마, or TÖKUSIMA, TÖ-ko-so-shi, Japan, capital of the prefecture of the same name, the largest city on the island of Shikoku, situated on the northeast coast, on the Kumano. It is an important steamship station, and a picturesque location on the coast and contain background. Pop. 70,000. The metropolitan population is 775,000.

TOLAND, John, English writer, London, 30 Nov. 1670; d. 1722. He was brought up as a Catholic, but read under the influence of Protestantism. He was educated at the University of Glasgow, and studied divinity in the University of Leyden. In 1696 he published a work entitled "Christianity not Mysterious," which was regarded as opening the door to controversy between deism and orthodox. The House of Commons ordered it to be burnt, the common hangman, and Toland then determined opposition from many. Though Locke gave him a certain support. He subsequently supported in literary hack-work and various for political party service. Besides the work mentioned he wrote a "Life of Milton" in an edition of his prose works: 1. "Hucul, Lord Holder" (1699); 2. "Anglia," a defense of the Act of Secrecy and "The State Anatomy of Great etc. (1717).

TOLEDO, 토레도, Ohio, city, seat of Tama County, on the Chicago, North Rail Road, about 50 miles north of Cleveland, and three miles west of the railroad junction on the Iron.
settled in 1844. It is in a fertile agricultural region in which there is considerable attention given to stock-raising. The industries are connected chiefly with the farm products. The principal public buildings are the county courthouse, jail, the churches and schools. The Emma Willard School is a High School and the Vermilion High School are the leading institutions besides a collegiate weekly. The government is administered by a mayor and a council composed of six members. Pop. 1,721.

TOLEDO, Ohio, city, county-seat of Lucas County, on the Maumee River, near its mouth; lat. 41° 30' N., long. 83° 32' W. The city is 587 feet above sea-level. It is 96 miles west of Cleveland, 124 miles north of Columbus and 234 miles east of Chicago. The northern corporation line is within two miles of the Michigan boundary. The city lies on both sides of the Maumee River, the principal business section being on the left bank; it extends from the river mouth, where the stream opens into Maumee Bay, over nine miles up stream. The area of the city is 31.59 square miles.

Commerce and Transportation.—The location of Toledo, at the western end of Lake Erie, gives it great commercial advantages, for it is at the head of the direct lake route eastward. The distance by lake to Chicago is 691 miles, while it is but 234 miles by rail. Hence there is an enormous traffic between the Eastern cities and the region lying southwestward, of which Toledo is the distributing point. The natural advantage is supplemented by the railroad system, the city being the centre of 16 trunk lines, making direct communication to the Atlantic on the east and the Pacific on the west, with direct lines north and south. These trunk lines, including their branches, give a grand total of 23, making Toledo second only to Chicago in the number of railroads; 393 trains and 572 interurbans arrive and depart every 24 hours. Many of the trunk roads reaching the city have dock facilities, with regular steamer connections to all important lake ports.

The location of Toledo makes it the most convenient shipping point for a large portion of the “winter-wheat belt,” and it is one of the markets of many grains produced in the United States, after Chicago. It has 12 grain elevators, with a storage capacity of 8,500,000 bushels. Toledo is the leading clover-seed market of the world and its quotations govern the prices of clover-seed for the United States. In 1918 Toledo received over 20,000,000 bushels of wheat, corn, rye, oats and barley. Toledo is one of the largest shipping ports for soft coal in the world. This comes by rail from the mines of West Virginia, southern and eastern Ohio and Pennsylvania, and is transported by water to all ports on the upper lakes. The Ohio Central, Hocking Valley, Pennsylvania and Baltimore and Ohio railroads have immense docks on the river front, with steam apparatus by which a carload of coal or a ton of iron ore is conveyed into the hold of a vessel. Similar appliances are used for the rapid unloading of iron ore coming from the Lake Superior mines, which is shipped by the same roads to the iron furnaces in southern Ohio. The city has, thus, producing a superior quality of iron and steel. There is also a very large trade done in lumber, salt, etc., Toledo being the largest distributing point on the lakes for coal, ore and lumber. More than 50 per cent of all the coal transported on the Great Lakes in 1918 was loaded in Toledo.

The harbor of Toledo lies entirely within the Maumee River, giving full protection to shipping. The Maumee is really a wide and deep estuary of Lake Erie, to the foot of the historic “Rapids of the Maumee,” just above Perrysburg, the site of Fort Meigs, famed for Harrison’s defense in 1813. Above this the river passes for some 15 miles over outcrops of limestone. At the northern city line the river opens into Maumee Bay, which is three miles wide and south by six miles east and west. Through the bay the United States government has dredged a straight channel, 400 feet wide by 21 feet deep and eight miles long from the mouth of the river. The harbor proper embraces the wide channel of the river, which is from 1700 to 1400 feet wide between the two points established by the government. The channel of the stream has been improved by the government to the same depth and width as the straight channel. The cost of this channel through the bay, and the necessary railway improvements, has been over $2,000,000. The wharfage space covers both banks of the river the entire length of the city, 18 miles in all, besides several miles on Swan Creek, a deep tributary which enters the river in the middle of the business section. Besides these there is an unlimited wharf capacity along the shores of the bay, now being utilized.

Manufactures.—The advantages of Toledo as a distributing point by lake and rail, its proximity to raw material and fuel, have caused its industrial interests to dominate all others. As an example of this is the fact that the renowned Lake Superior iron ores and the coal and coke from the Ohio and West Virginia fields meet at its wharves on a common basis of economy. This resulted in the building in 1903 and 1904 of a blast furnace and steel plant on the river front by the Toledo Furnace Company with a capacity of 400 tons per day. This company is now capitalized at $4,000,000 and its capacity has been doubled. Other great industrial establishments nationally known and with large capital invested in Toledo are the Willys-Overland Company, $75,000,000, producing passenger automobiles. This is the second largest automobile plant in the world; the Paragon Refining Company, $25,000,000, which refines petroleum; the Owens Bottle Machine Company, $15,500,000, producers of the bottle-making machine, which has revolutionized that industry; National Supply Company, $14,000,000, producing oil well supplies and machinery; the Electric Auto-Lite Company, $13,000,000, producing automobile starting and lighting systems; the National Malleable Castings Company, $8,000,000, with the largest malleable casting plant in the world; the Sun Company, $8,000,000, refiners of petroleum; the Detroit Machine and Tool Company, $3,000,000, builders of presses and machine tools; the Towar Textile Mills Corporation, $2,500,000, producing heavy ducking and belting; the Champion Spark Plug Company, $2,000,000, produces more than 50 per cent of all the spark plugs in the world.
the Ed. Ford Plate Glass Company, $2,000,000, manufacturers of polished plate glass; the Toledo Shipbuilding Company, $2,000,000, which has built some of the largest ships on the Great Lakes; the Ohio Superphosphate Company, $1,000,000, manufacturers of fine cut glassware and electric light bulbs; the Hettrick Manufacturing Company, $1,000,000, manufacturers of tents, awnings and canvas goods; the Toledo Sugar Company, $1,000,000, which refines sugar from beets extensively cultivated in the territory surrounding Toledo; the Toledo Scale Company, $900,000, manufacturers of the famous Toledo scale; Milburn Wagon Company, $700,000, builders of farm wagons and electric vehicles. There are more than 600 other busy manufacturing plants in Toledo; in the Manufacturing Directory, issued by the Toledo Commerce Club, there are 921 different classifications of articles made in Toledo. Toledo is the centre of the midwest, and it has six railroads, the Toledo and Detroit, the Toledo and Buffalo, the Western Maryland, the Toledo and Chicago, the Toledo and Chicago Electric. There are four plants in Toledo capitalized at $1,250,000, producing bicycles and children's vehicles and giving employment to more than 1,000 men. More than 60,000 people are employed in the industries of Toledo. Most of the oil and gas in the oil field is supplied by the Toledo Railway and Light Company. The Acme Power Company, a subsidiary company of the Railways and Light Company, has completed the first unit of an $8,000,000 plant, which will be utilized to further electrify Toledo's industries. The Standard Oil Company of Ohio has erected a $5,000,000 refinery. This company has a pipe line direct to the mid-continent field, through which the crude oil is pumped. The $20,000,000 nitrate plant started by the government in 1918 in Toledo is to be converted into a permanent arsenal. Toledo is one of the busiest wholesaling and jobbing centres in the Middle West. The many railroads and electric lines make shipping easy to any territory surrounding the city. Post office records show that 42,000,000 people can be reached with overnight mail service. Large manufacturers in the East and West maintain branch houses and distributing stations in Toledo.

Banks.—There are four national banks and 18 State savings and private banks in Toledo. The capital of the national banks is $3,500,000, and the surplus and undivided profits of these banks amount to $4,499,382. The capital of the other 18 banks totals $8,140,300, with surplus and undivided profits of $2,366,619. In addition to these banks there are eight building and loan companies with a combined capital stock of $20,700,000. At the beginning of 1918 the bank deposits in Toledo were $100,000,000; clearings during 1918 totaled $539,114,586. Toledo also is home of nine bond houses, which do business upwards of $85,000,000 annually. In 1918 Toledo lead all cities of its class in postal savants deposits. Records show there were 2,950 individual depositors and $1,318,173 on deposit. The post-office receipts in Toledo in 1918 totaled $1,391,000.

Municipal Conditions.—The slope from the lake on both sides is gradual, but ample drainage is sufficient to ensure good drainage. It is well laid out, with wide streets. These aggregate 425 miles in length, of which 400 miles are sidewalked, 256 miles electrically lighted and 24 miles are paved, chiefly with wood block, brick and asphalt. The residence streets are beautifully shaded, and the absence of all fencing, it is said, gives this city a distinctive appearance. The sewage system is excellent, there being a total of 292 miles, all emptying into the Maumee River. The waterworks originally cost about $1,400,000 and has a capacity of 70,000,000 gallons daily, with 350 miles of street mains. The city is supplied with natural gas brought from three fields, northwestern Ohio, central Ohio and West Virginia; and there are 25,000 consumers, the gas being used only for household purposes. The electric car system is very complete, covering 120 miles of streets and accommodating all sections of the city. There are 10 distinct interurban electric roads in addition, with freight and passenger stations in the business centre. They have a total of 1,546 miles of track, the United States having a large number of surrounding cities and villages, including Cleveland and Detroit. The discovery of gas and petroleum in northwestern Ohio in 1886 was one of the contributing causes for the growth of Toledo, as this city is the natural metropolis of two United States, and this business remains a potent factor. The rapid growth in population caused the expansion of the residence section in Toledo. In the west end of the city, which was the newer area, there are thousands of beautiful homes set among the original forest trees. In more recent years beautiful residential sections have been developed by real estate operators. Ottawa Hills is one of the most beautiful high-class residential developments in the country. Many large homes have been built in the up-river section. Toledo has a greater per cent of home-owners than any city of its size in the country. The working man owns his modest home and takes pride in his lawns and garden patch. All of the residential streets are well paved and lighted with 3,160 arc lamps.

Buildings.—Among the notable buildings are the courthouse, in front of which is a life-size bronze statue of President McKinley, erected in 1903; the Museum of Art; the Christian Association building; the Masonic temple; the Young Woman's Christian Association building; Newsboys' building; the City Market; the Terminal Auditorium, which will seat 5,000 persons; handsome Temple and Social Club building; Woman's building; a Soldiers' Memorial building; arms of the Ohio National Guard; the Public Library (which has 50,000 volumes and five sub-stations); the Valentine Theatre, one of the finest and most artistic interiors in the United States, and many modern office and business blocks.

Churches and Schools.—There are 45 church edifices in the city, nearly all having Sunday-schools. Some of the rooms devoted to the latter are up to the best modern standards in plan and equipment. Nearly all have large libraries for the use of the scholars. There are two public high schools, built at a cost of $125,000 each, a manual training school and a vocational high school. There are 51 public school buildings, 50 public schools belonging to and controlled by the Roman Catholic Church. The latter Church also supports an academy under the Ursuline Nuns.

ality and parks are being increased in-
 as rapidly as the city budget permits.
 creation.—Toledo offers all the advan-
 of a summer resort, because of its proxi-
 Lake Erie and its fine beaches. Just 45
 s from the heart of the city is located
Beach. Here will be found many com-
 summer homes along the edge of Lake
xtending for a distance of several miles.
eds of Toledo people spend the summer
 at the beach, going to and from work
. The street cars run to the beach every half hour to service this resort. Point Place
tewater, located on the bay just outside
 limits, are meccas for fishermen. On
h shore of Maumee Bay will be found
 View Beach, with many cozy summer
estled among the groves which border
shore. In the city Walbridge, Riverside
y View parks are located on the banks
 Maumee River. These are easy of access
and daily, during the summer time, attract thou-
ousands of people. Yachting and boating are
favorite sports in Toledo. The river and bay
 are dotted with small crafts of all kinds. More
 than $5,000,000 has been invested by the people
 of Toledo in sailboats, motorboats, canoes and
 cruising yachts. There are three yacht clubs
 and a power boat club. The city maintains one of the finest buildings of its kind
 in the country at the mouth of the Maumee
 River. This club adjoins Bay View Park. The
 Toledo Power Boat Club is situated on
 the bay near Bay View Park. The Maumee
 River Yacht Club has headquarters on Ottawa River near the
 bay. The city maintains a municipal club
 house at Riverside Park. There are many
 other smaller club houses supported by canoe
 clubs, etc. In the winter time ice boating
 and skating are the leading outdoor sports. Prac-
tically all of Toledo's parks have public swim-
ming pools and the most modern playgrounds
 equipped for the children. In Ottawa Park
 there is one of the finest municipal golf courses
 in the United States. Public tennis courts also
 are maintained by the city. Fine golf courses
 are maintained by the Inverness Club, Country
 Club, South Shore Country Club and the Sylvan
ia Golf Club. There is a keen interest in
 Toledo in baseball. Toledo supports a team in
 the American Association, and Swayne Field,
 the home of the Toledo team, is one of the
 finest ball parks in the league. There are many
 semi-professional teams which have large fol-
 lowings. The city maintains ball diamonds
 in several of its parks. Toledo is a Mecca for
 excursions during the summer months; people
 come for hundreds of miles to take trips on the
 water. Three passenger steamship lines main-
tain regular service to Sugar Island, Detroit,
 Mackinac, Put-in-Bay, Cedar Point, Cleveland,
 Buffalo and other points on the Great Lakes.

Government.—Toledo has a simplified
 form of the Federal form of government. The
 people elect the mayor, vice-mayor and one
 ward councilman. All other city officers are
 appointed by the mayor, with the exception of
 the city clerk, who is elected by the council. All
 city offices are for a term of two years. There
 are 16 wards. The vice-mayor presides over
 council, but has no vote except in case of a
 tie. The mayor's cabinet, appointed by him,
 consists of the heads of various city depart-
ments; these are a director of law, director of
 public service, director of public safety, director
 of public welfare, director of finance.

History.—The Maumee River was one of
 the most important routes for travel by the
 Indians and the white traders. Going by canoe
 to a point near Fort Wayne, Ind., a portage of
 a few miles enabled them to reach the head-
 waters of the Wabash, which they followed to
 the Ohio and thence to the Mississippi. An-
 other important route passed down the Auglaize, a southern tributary, thence by
 portage to the headwaters of the Great Miami,
 which reaches the Ohio just below Cincinnati.
 An important Indian trail also crossed the river
 at the rapids above the city, by which hunting
 parties went to Kentucky. A few French Can-
 adian hunters and trappers settled, in the 18th
 century, at points within the present site of
 Toledo; but there is no reliable account of the

vol. 26 — 43
earliest sporadic settlement of Americans on the city plat. In 1805 a treaty was made between the United States and the Indians, at a stockade, named Fort Necessity, which stood on a high clay bluff at the junction of Swan Creek and the Maumee. By this the red men yielded title to the "Fire Lands," granted to the citizens of Groton and New London, Conn., in recompense for the burnings of these towns by the British in the Revolution. In 1817 a company of speculators laid out a town at the mouth of Swan Creek, called Port Lawrence. Very few settlers came, however, and the hamlet languished. In 1832 another settlement, named Vistula, was begun by Major Stickney, for many years Indian agent, a mile further down the river, at the foot of what is now Lagrange street. This spurred the owners of the land at Port Lawrence to new efforts, and a brisk rivalry sprang up between the two villages. The two were wisely consolidated in 1833. A public meeting of the citizens of both was held to determine the name of the united town; and, at the suggestion of Willard J. Daniels, the name Toledo was adopted. He had been reading a history of Spain, and urged the name of the old Moorish capital for the reasons that there was no town of that name in America, that it has a pleasant sound and is easily pronounced. Toledo was incorporated as a city in 1846.

The town had slow growth until the opening of the Wabash and Erie Canal, from Toledo to the fertile Wabash Valley in Indiana, in 1843, and of which from Defiance south to Cincinnati, called the Miami and Erie Canal, which was opened to traffic in 1845. In 1846 these two canals brought to Toledo products valued at $3,000,000, while those going from Toledo to points on both aggregating nearly $5,000,000. The first railroad to reach Toledo was called the Erie and Kalamazoo, which was opened from Toledo to Adrian, Mich., in 1836, the cars being drawn by horses. The next year a locomotive was put on the line, and a contract for carrying the mails was obtained from the government. The road was sold by the sheriff in 1842, and its line is now part of the great New York Central system.

Population.—The population (1840) was 1,223; (1850), 3,017; (1860), 13,182; (1870), 66,497; (1880) est. 262,000.

RAYMOND T. SKINNER,
Toledo Commercial Club.

TOLEDO (Sp. tô-lâ'tho), Philippines, pueblos, province of Cebu, on the west coast, 35 miles west of the pueblo of Cebu. Petroleum and natural gas are reported in the vicinity. Pop. about 13,300.

TOLEDO, Spain, in New Castile, capital of a province of the same name, on the Tagus, 45 miles southwest of Madrid. It is the archiepiscopal see of the primacy of Spain. The city is walled and occupies an activity, around which rise lofty mountains. The city is built compactly, houses crowded, streets steep, winding, narrow. The chief public buildings are the Alcazar (1551), once including fortress and palace, which occupies a central and high point of the town; the great Gothic cathedral (1227-1494), a vast imposing edifice of great architectural merit, which has seen many vicissitudes for it retains some fine stained glass and a choir of marvelous beauty. The large church of Zocodover is the fashionable pew and thoroughly Moorish in character. The heretics were burned at the bull's-eye place. There are besides a theological monastery, several palaces and hospice manufactures comprise the famous sword-blades, small arms, church vestments, silks, wool and cotton finest confections. Toledo was the ancient all Spain and important in the city. It was taken by the Romans in 150 and subsequently was occupied in Gots, Moors and Castilian monar and also the seat of the Inquisition (q.v.). The town is now sadly decadent. The town was often damaged by fire, has been considerable expense. Pop., about 200,000.

A. F., "Toledo: an Historical and Descriptive Account" (New York 1919).

TOLEDO NEWSBOYS' A. TION, The, was organized 1892, by John E. Gunckel (q.v.), as the president. Mr. Gunckel remained president of the organization until his death in 1915. The outpacing efforts of the association had a growth and was the means of reclaiming heretofore neglected boy and girl and giving them their lives, making them useful citizens, capable of carrying on the furthering the plans of the organization, which, like all cities, must be a generation. To-day former size of the association is filling and its managing the great business city. Following his death, Mr. J. D. Robinson, one of Toledo's greatest philanthropists, was its president, and again the association is placed on a solid foundation.

A history of the association has its enjoyment and prosperity. The association is as the city, loyally supported by the philanthropic people of the city, and every advantage is offered by the streets to become a useful and honest citizen. The boys are constantly warned of evils and dangers that beset them and to refrain from gambling, stealing, lying, drinking, smoking, cigarettes, and going into saloons or associating in company. A fine brick building built in 1915 costing $110,000, dedicated to the newboys, Toledo, furnishes them one of the finest among young persons in the city together with a spacious well-equipped gymnasium and swimming pool of large capacity, fine library rooms, furnished kitchen and dining-rooms, and special rooms for band and orchestra practice, where the association maintains a piece band and 14-piece orchestra. The association now has a membership of 11,500. Its day afternoon entertainments, a special feature of the association, from 1 October to 31 December given by the schools, churches and other organizations of the city, are highly approved by the boys. A fine auditorium has been filled to its capacity. The association maintains a court of investigation, where boys are required to account for misconduct. The employment bureau within the association provides a valuable asset, and many boys are placed in responsible positions, later to best
or managers. The boys are en- l to return all found articles to the Articles of more than $50,000 have turned to their rightful owners, for is it found, the "honor" badge. In the entire association is tendered an or better known "Field day," which iis to add a bright page to the history ewshoy.

EDO WAR, The, a name popularly the contest over the division line be- ficham on the north and Indiana and the south. It arose out of an error in- tion of the southern point of Lake 2. In 1805 the Territory of Michigan inuniied in conformity with the Ordinance which provided that the line between diana and Illinois on the south, and the on the north, should be "an east and e running through the southern point Michigan." This was set down on the the times 42° 32' N., but when Michi-organized it was found that the true ough the southern point of Lake Michi- miles to the south, or 41° 37' 19" N., more southerly line was adopted. But diana and Illinois were organized as the northern line was adopted, and there i left a belt 65 miles broad claimed by actions. Congress ordered a survey, as completed in 1817, establishing the line, near the northern one. But the Michigan protested vehemently, as the Toledo was in the disputed belt. In oy act of legislature organized town- this territory, which had long been the control of Michigan. Then both 1 and Ohio appealed to President Jack- got no relief. The governor of Ohio it the militia, the governor of Michigan wise and occupied Toledo. When it is a conflict could no longer be pre- re matter was settled by the admis- gan to the Union as a State upon con- her acceptance of the "Harris" line, ing her in recompense the northern part peninsula of Wisconsin. Great deposits r and iron being found in this penin- igichigan accepted the conditions and the Union as a State 26 Jan. 1837. See TOLL, Eduard, Baron von, Russian explorer: b. 1850; d. 1902. In 1885 he began to explore the Post-Tertiary fauna of the Jana region, and in 1893 found the body of a mam- moth in the ice near the delta of the Jana. Later he commanded the Sarja expedition which wintered on the west coast of Kotelnoi Island (1901-02) and discovered large deposits of Post-Tertiary fauna, including mammoths, reindeer, etc., in the great ice-cliffs there. With F. G. Seeberg he started south in November 1902, and perished on Bennett Island, where their records were found by Kolchek a year later. Consult Toll, Emma, "Die Russische Polarfahrt der Sarja" (Berlin 1909).

TOLL, a tax paid or a duty imposed for a privilege granted, such as the payment claimed by owners of a port of entry for the privilege of landing or shipping goods; the fee exacted by those who erect or maintain a bridge for the privilege of passing over the same; a portion of grain retained by the miller as his compensation for milling; a charge made by a member of a fair or exhibition for the privilege of exhibiting or selling goods; a compensation for services, especially for transportation, as canal or railway toll. In the United States tolls, as applied to bridges and highways, are a subject for State legislation, while those applying to rivers and harbors are usually in the provision of Congressional action. Tolls were at one time of international importance, since they were exacted on certain straits and tidal rivers by virtue of the sovereignty of a particular state, such as the Scheldt tolls and sound dues levied by Denmark. The tendency in the United States is to abolish tolls, and most bridges and
to civilization is persecution on account of re- ligious belief permitted by law.

In all ages enlightened minds have favored toleration. It was the rule among the ancient Greeks, and also among the Romans, until religion became so identified with state affairs that refusal to accept the state religion was treason to the government. Toleration was unknown in practice during the Middle Ages, although it had earnest advocates among Christians, Mohammedans and pagans. In modern times toleration has been a growth of the past three centuries. As late as the early part of the last century men were imprisoned in New England for refusing to pay taxes for maintenance of the local church. English Roman Catholic disabilities in 1829, but did not admit Jews to Parliament until 1858. In a legal sense toleration is now coextensive with civiliza- tion and semi-civilization, but education only can make it effective by causing the national and tolerant spirit to take the place of intolerance and fanaticism, wherever the latter pre- vail.

TOLERATION ACT, a statute of Wil- liam and Mary, under which freedom of wor- ship was granted to Protestant dissenters from the Church of England, provided they made a declaration against transubstantiation and took the oaths of allegiance and supremacy. See Toler- ation.

TÓLIMA, to-lé'má, Colombia, a volcano rising from the central cordillera of the Co- lombian Andes to a height of 18,320 feet.

ERATION, a word meaning in its sense forebearance without approval, as state has an established church, but which are tolerated—that is, their are permitted to worship in their own place of worship without any religion. It was much America, however, in a narrower, or a broader, sense, during the struggle to to the compulsory support of Con- nected with the taxpaying in cer- ry England States, especially Connecti- cicut is now universal in civilized so far as permission to worship is d, but some restriction still exists as to ng by Roman Catholics in Sweden, and a certain degree of intolerance toward its in some South American republics, however, in any country pretending
highways are now free to the public. See Taxation.

TOLMAN, Herbert Cushing, American Greek scholar; b. South Scituate, Mass., 4 Nov. 1865. He was graduated at Yale and studied at the universities of Berlin and Munich. He received his Ph.D., from Yale and was honored with the degree of D.D., from Peabody College and S.T.D., Hobart College, and L.L.D., University of Nashville. From 1884 he was head of the Greek department of Vanderbilt University and is the author of several works on classical and philological subjects. His 'Ancient Persian Lexicon and Texts' and 'Ancient Persian Lexicon and Coptic Supplement' were adopted immediately after publication by the universities of Germany and were recognized by foreign philological reviews as superseding what had yet been done in that line of research, while the American Journal of Philology and the New York Nation spoke of the author as the leading American authority in the field of ancient Persian language. He was the first to identify positively the hitherto unknown season of the Persian month, Garmadporda, with June-July, an identification of great value to historians in fixing accurately several important dates. Dr. Tolman was elected president of Hobart College in 1913, but declined. In 1915 he was appointed dean of the College of Arts and Science of Vanderbilt University.

TOLMAN, William Howe, American safety engineer; b. Pawtucket, R. I., 2 June 1861. In 1882 he was graduated at Brown University and from 1894 to 1896 was general agent of the American Association for Improving the Condition of the Poor, and served as secretary of the New York commission on public baths and of the improved housing council of the same city. He is founder and from 1908 to 1916 was director of the American Museum of Safety. He has taken part in national housing congresses and is member of several societies for social betterment, both American and foreign. Dr. Tolman is the author of 'History of Higher Education in Rhode Island' (1901); 'Municipal Housing in the United States' (1894); 'Handbook of Sociological Reference for New York City' (1894); 'Report on Public Baths and Comfort Stations' (1897); 'The Better New York' (1906); 'Social Engineering' (1909); 'Hygiene for the Worker' (1912); 'Safety' (1913); also 'Industrial Betterment,' a monograph prepared for the United States Section of Social Economy, Paris Exposition of 1900, and various review articles.

TOLOWA, toł'owa, originally the name of a village, but extended to designate a tribe of the Athapaskan stock of North American Indians occupying the coast of California from a point a few miles north of the mouth of Klamath River northward to a short distance beyond the boundary of Oregon and the valley of Smith River. They were noted basketmakers and fishermen, especially on salmon and other fish. In 1842 they were placed on a reservation, which was abandoned six years later, since which time they dwindled and largely disappeared.

TOLSTOY, Count Lyof Nikolaievitch, Russian novelist and social reformer; b. Yasnaya Polyana, government of Tula, 9 Nov. 1828; d. Astapova, 20 Nov. 1910. In languages and law at the University of Moscow. In 1851 he went to the Caucasus despatch of artillery and he served at Sevastopol during the Crimean. This period of his career he spent in literary works, among them the memorial 'Childhood,' Boyhood, and 'Confession.' A brilliant description of the Crimean entitled 'Sevastopol in December' was published in August 1855, and 'Sevastopol in May 1855' and 'The Invasion,' the army on the conclusion of the war with Saint Petersburg, where he made his residence. Turgenev (q.v.) and other distinguished Russians and soon after he came to be known as a first-class writer. His return to his estate marked an epoch in his spiritual history. He retired to his estate and led a simpler life. He was greatly interested in the condition of the peasants and founded a village school on his property, for preparing teachers. At the end of two years, however, was closed, both on account of the government inspectors and the interest of the masters and pupils when he asked permission to reopen it after the government flatly refused. Happiness was issued in 1859 and was followed by 'Three Deaths' (1859), 'Po' (1860) and others. In 1862 he married a daughter of a Moscow physician. The news of his marriage was the completion of the latter novel. He began to develop his characteristic views of human and its effects upon the work of his literary reputation. 'War and Peace' (1865-69), the Napoleonic invasion of Russia; 'Karenina' (1877), a powerfully revealing human passion and its effects. It is a novel on the precept, 'Resist not evil.' His has much in common with the religion of his fellow-countrymen, but its peculiar religious basis gives it a character. In 1901 he was formally excommunicated by the Holy Synod of the Orthodox Church and in a reply to excommunication he clearly expressed the denial of the Trinity, of Jesus and his vicarious atonement, of conceptions of the future world, of sacramentalism and similar dogmas substantially identical with those of Unitarianism. Among the latest period, in which his views are more or less expressed the following: 'What the People Live upon' (1889); 'What to Do' (E. B. W.); 'My Confession'; 'My Religion,' and of Joan Ilyitch (1886); 'Where God is Also'; 'The Kingdom of God,' 'The Kreutzer Sonata'; 'Work while ye have the Light' (1890), a tale of the early Russian Power of Darkness, a drama; ;
ghtenment' (1891), a satirical comedy; 'and Servant'; 'Politics and Religion'; ism and Christianity' (1894), on the Russian alliance, and 'What is Art?' 'Resurrection' (1900) is a powerful f the same type as 'Anna Karenina,' are American translations by Dole, d and others (22 vols., New York 1902), Leo Wiener (24 vols., Boston 1904-05), gave up all privileges of rank in order a life of labor and asceticism and dur-great Russian families. He found abundant canty for carrying out his gospel of social (See ANNA KARENINA; WAR AND Consult De Vogüé, 'Le Roman Russe' Dupuy, C. E., 'Great Masters of Rusterature' (New York, 1886); Gan, ce. 'Tolstoy: His Life and Writings' n 1914); Howells, W. D., 'My Literary 3' (New York 1895); Lloyd, J. A. T., Russian Reformers: Ivan Turgenev and sly (ib. 1911); Löwenfeld, 'Leo (1802) Haude, A., 'The Life of o (2 vols., New York 1910; 4th ed., Merezhkovsky, D. S., 'Tolstoy as Man (ib. 1902); Rolland, R., 'Tolstoy' 1); Tolstoy, I., 'Reminiscences of (ib. 1944); Turner, 'Count Tolstoy elist and Thinker' (1888).

'TECS, töl'tëks or töl-täks', an Indian id to have occupied portions of the plateau previous to the advent of the Little is known of the race and that by through Aztec traditions and picture. They are supposed to have come from th and to have been supreme in their, from the 7th to the 11th century. principal city was Tolan, where they set up 661 A.D. from which they got the oltec. Lists of their kings or chiefs are - but these are considered untrust-bly antiques. The hero-god Quetzel-is supposed to have lived in their cities their overthrow, which came in 1013, they were driven south by savage tribes. records tell no more of the Toltocs, but e fact that the Quichés and other tribes e north are known to have settled in ita about this time, the inference is that they were banished Toltecs.

TOLTECS—TOLUENE 677

'TOCA, to-look'ká, Mexico's capital of e of Mexico, 36 miles southwest of City, on a division of the National', 8,761 feet above sea-level. Three railways — the Mexican National, the and San Juan and the Toluca and, all narrow gauge, supply transporta-tilities and there is a well-equipped street. The city is situated in the beautiful Toluca, just over the mountain range forms the western background of the capital. This valley, which lies at the the Toluca Mountain, is one of the tably productive and beautiful spots of public. The city was founded by the nca Indians and was advanced to the in rank of city in 1677. The industries a brewery, large flour-mills, glass-bottle two packing-houses and several mod-amenies. There is a local bank—the the State of Mexico—a branch of tional Bank and an agency of the Bank ton and Mexico. The city is well paved and provided with beautiful plazas, one of which contains a monument in honor of the patriot priest, Hidalgo, dedicated in 1900. In another plaza is a life-size figure in bronze, of Morelos, while in still another is an imposing monument to Columbus. A museum supported by the state occupies a spacious building and the State Library, containing some 11,000 vol-umes, is located in the immediate vicinity. The principal buildings are the palace of the state government, the municipal palace, the Scientific and Literary Institute, civil hospital, School of Trades and Arts. Pop. 33,000.

TOLUENE, methyl benzene, C6H5CH3, is an aromatic hydrocarbon present in American petroleum, in wood-tar and in coal-tar. Upon distillation coal-tar yields a fraction known as light oil, boiling at 100°-120° C. The toluene of commerce has been obtained from this fraction. Toluene has also been prepared (1) by the dry distillation of tolu balsam; (2) by heating bromobenzene with methyl iodide and metallic sodium (Pfitz Synthesis); (3) by treating benzene with methyl halide and dry aluminum chloride (Priedel-Craft Synthesis); (4) by heating toluic acid with lime. The enormous demand for toluene created by the European War, made it the subject of a number of patents. According to Fr. P. 479, 295, the compound is made by passing hydrochioric acid into boiling methyl alcohol in the presence of dehydrated zinc chloride and con-duting the methyl chloride produced into a mixture of benzene and dry aluminum chloride. Other patents claim to have obtained toluene from gas-tar naphtha by distilling under press-ure at 130°-240° C. (U. S. 1,225,237) or, from gas-drip naphtha, by passing it with steam and water-gas through checkerwork heated to about 800° C. (U. S. 1,230,087). To these may be added the widely-advertised "cracking" process, according to which toluene and benzene have been obtained by heating oils, containing aliphatic or aromatic hydrocarbons, at prescribed temperatures and pressures. The process has been tried on a large scale, but its success as a commercial enterprise has been seriously ques-tioned. Of much greater importance are the improvements inaugurated for the extraction of the maximum amount of toluene from cokes-oven or city gas supplies. It has been known for some time that only a small fraction of the toluene obtained from the by-products coke-ovens is recovered for commercial purposes, the greater proportion finding its way into city gas during the process of distillation. Toluene recovery plants have, therefore, been installed in all parts of the United States with the object of stripping illuminating gas of this material. As a result of this measure the toluene output for 1918 has probably exceeded 20,000,000 gal-lons. The maximum output for 1912-13 was not over 500,000 gallons.

Toluene is a colorless liquid with a boiling point of 110° C. and a specific gravity of 0.872 at 15° C. It is an excellent solvent for many organic compounds. With a side-chain that readily responds to a number of reactions and with a nucleus that can be nitrated, sulphonated, halogenated or reduced, toluene is capable of forming a large number of derivatives which are either useful commercial products or in-termediates for the manufacture of explosives,
synthetic dyes, perfumes, drugs, substitutes for sugar and poisons used in chemical warfare. Trinitrotoluene, saccharin, indigo-blue, bromo-benzyl cyanide, benzyl chloride, benzotrichloride, boric acid, nitrobenzene, toulidine, are some of the more important derivatives of this hydrocarbon.

V. S. BARASINIAN, 
Lehigh University.

TOLUIDINE, CH₄N₄H₃, exists like all dissubstitution products of benzene in the ortho, meta and para modifications. When toluene is treated with nitric acid, a mixture of ortho- and para-nitrotoluenes is obtained. The reduction of this mixture yields the corresponding ortho- and para-toluidines. These are separated by strongly cooling the product, when the ortho compound remains as an oil, while the para compound solidifies and may be removed by filtration. Or, the mixed toluidines are treated with a quantity of sulphuric acid insufficient to effect complete neutralization; the ortho compound is now removed by distillation, while the para compound remains behind as a sulphate. It has also been noted that the oxalate of para-toluidine and its phosphate are much less soluble than the corresponding derivatives of the ortho compound. Upon these properties are based a number of methods for the separation of the two modifications. On account of the high cost of manufacture, meta-toluidine is used to a limited extent only. It has been obtained by the reduction of meta-nitrobenzal chloride. Meta-toluidine may be readily obtained from meta-nitrotoluene, but the latter can only be prepared on a commercial scale by indirect methods.

Ortho-toluidine is an oily liquid. It boils at 197°-199° C. and has a specific gravity of 1.102 at 4° C. Meta-toluidine is also an oily liquid with a boiling point of 203° C. and a specific gravity of 1.041 at 4° C. Para-toluidine is a solid which crystallizes in leaflets. It melts at 43°-45° C. and boils at 190° C.

Ortho- and para-toluidines are important intermediates in the dye industry. After diazotization they may be coupled with G Acid to form Ponceau G, with R Acid to produce Ponceau R7, with beta-naphthol sulphonic acid S to form Orange GT, and with dioxy-naphthalene sulphonic acid S to yield Azofuchsin B. Magenta is an oxidation product of a mixture of toluidines and aniline; Primuline is a fusion and sulphonation product of penta-toluidine and sulphur; Mauveine, Safranine, Chloramine Yellow, Cochenille Scarlet 2R, Spirit Yellow R, etc., are obtained from toluidines. Simple derivatives of toluidines have also been used for the manufacture of certain pigments; thus diazotized nitro-toluidines have been coupled with beta-naphthol producing Orange R, Fast Red 6H., Lithol and Fast Scarlet R.

TOM, known as BLIND TOM. See Blind Tom.

TOM, Asia, a river in southern Siberia, in the government of Tomsk, rising in the Altai Mountains and joining the Angara. It is about 30 miles, flowing northward into the Ob. It begins to be navigable at Kusnez.

TOM BROWN'S SCHOOL DAYS, a story depicting English public-school life, written by Thomas Hughes and published in 1857, when the author was a young barrister of three-and-thirty. In its popularity it has never lost. Tom is a typical middle-class lad, with the distinctive British virtues of pluck, honesty and the love of fair play.

TOM JONES. 'The History of Tom Jones, a Foundling,' a novel by Henry Fielding, was published 28 Feb. 1749—a red-letter day in the calendar of English fiction, for the work in the opinion of many stands at the head of all novels ever written in our language. It succeeded several most interesting experiments in the novel of contemporary manners such as Richardson's 'Pamela' and 'Clarissa Harlowe,' Smollett's 'Roderick Random,' and his own 'Joseph Andrews.' When Fielding wrote 'Tom Jones,' his intellect, wonderfully observant and penetrative, was at full maturity; his pen he had long practised in the drama and the essay, and in fiction: his mind was highly cultivated in the ancient and modern literatures; he had associated with all classes of people, the high and the low, and he had thereby gained a knowledge of the men and women of his time unsurpassed by any then living. His aim was to present the very form and pressure of the age, and on the effort he expended 'some thousands of hours.' Having in mind the ancient epics, he divided his novel into 16 books, each with an initial chapter on the art and morality of that 'new province of writing' which he claimed to be introducing to the British public. In its original form, 'Tom Jones' filled six volumes, containing, all told, about 330,000 words.

For his comprehensive view, Fielding began his delineation of character in the country with two Somerset gentlemen—Mr. Allworthy and Squire Western, the one a Hanoverian and the other a Jacobite. Into the household of Allworthy he placed a sister, Bridget, and Deborah, a pair of nephews, Tom Jones and Master Blifil and their tutors, Square the Jew and Thwackum, the orthodox divine. Into the household of Western he placed a sister, Diana, daughter, Sophia and nurse, Mrs. Honour. Then, after describing life in the country while Tom and Sophia were growing up, he brought most of his characters up to London for contrast and interaction with more highly-seasoned men and women of the town. The manner in which Fielding conducted his story, concealing until the end the mystery of Tom's birth, has received the highest praise ever since the novel first appeared down to the eulogy by the late W. E. Hedges, Scott, for example, likened the narrative to an easy flow of a river through lands affording wide prospects; Coleridge thought the art structure of the plot was equaled only by that of the very greatest dramas, such as the 'Oedipus' of Sophocles. And in general, his exception has ever been taken to Fielding's craftsmanship beyond his introduction of the tale of the 'Man of the Hill,' the matter of which a modern novelist would manage differently. It is not to be inferred that Fielding laid out a plot by compass and rule. At the outset, he probably had in mind his conclusion.
but nothing more. He wrote at leisure, remembering what he had seen and heard, letting his story develop as he proceeded, casting his words in the German, and out and then giving them up at the end all the threads of his narrative into a consistent and impressive whole. This is the way that literary genius, in distinction from mere literary talent, works, and achieves its effects.

Apparently Fielding drew his characters in the main from real life. Where he followed his model too closely or where he deviated too far from it, his success was only partial. Squire Allworthy, who had an original in Ralph Allen, the philanthropist of Bath, is altogether too good for this world; he lacks those elements which really make a man, lovable and humorous as he is. Likewise Blifil, for whom no original was ever claimed, is hardly more than a stage villain, whose hypocrisy is so transparent that it should have been detected long before it had a chance to work its mischief. Thwackum and Square, though rather artificial creations, are always entertaining, for they have enough of their own to support their humorous passions. Partridge, the schoolmaster and barber, superstitious and afraid of his dreams, interested Voltaire greatly. Minor characters, like Diana Western, Mrs. Honour and Bridget Allworthy, are almost always admirable. For a superb creation we turn to Squire Western—the fox-hunting squire who goes to bed drunk and gets up in the morning before daybreak to follow the hounds, who loves his daughter better than all other creatures except his kennel, who quarrels with his sister, swearing great oaths referential. Under the excitement of Sophia's refusal to marry Blifil, he develops into a veritable whirlwind of contending passions. The height of the storm is reached in certain scenes with his sister, which, brutal as they are, have never been surpassed for humor in this language of ours. His daughter, Sophia, for whom Fielding's own wife, Charlotte Cradock sat, is a portrait of unusual charm. She is a real woman depicted in all her beauty, fine feeling, self-possession, modesty, vivacity and independence when the inevitable struggle comes between paternal tyranny and the promptings of her own heart. She wins the first great battle in our fiction for the enfranchisement of her sex.

The crux of the novel has always been the hero, who resembles Fielding himself in temperament but not in the incidents of his career. He is kind, generous, chivalrous and perfectly honest, but he is lacking in practical sense, and so gets into all sorts of mistakes in conduct. He loves Sophia desperately and would win her at all hazards. This passion, however, does not protect him against the allurement of other women, and herein lies the trouble. Generous critics overlook the boy's affairs with Molly Seagrave and Mrs. Waters, but they hold at the intrigue with Lady Bellaston. Had Fielding thrown in a word of explanation over that intrigue, Coleridge would have excused all. Here arises a question that may be terminally decided by a few words of explanation. The intrigue is necessary. He depicted the young man of his time as he was without comment. In thus keeping his art true to nature he acted rightly.

The influence of 'Tom Jones' cannot be well considered apart from the influence of Fielding's other works. The novel was immediately translated into French, Dutch and German, and Sud and French, and put through all the stages of publication in Polish and Russian. The French imitated it, dramatized parts of it and turned it into a comic opera. The Germans appropriated its disquisitions on the art of fiction and to some extent wrote novels in its style. 'Tom Jones' has probably been reprinted in English a hundred and fifty times. To pass by a host of imitations, it suggested the general outline of plot to Scott for 'Waverley,' his first novel; its spirit permeates the best work of Thackeray, and 'Pendennis' was written in direct imitation. In short, to 'Tom Jones' nearly all succeeding novelists are indebted who have aimed to depict life, not as it ought to be, but as it really is. Since Fielding's day fiction has extended its scope to include things never dreamed of by him; but for method, manner and procedure his art is the source. Scott called him 'the Father of the English Novel.'

Wilbur L. Cross.

TOM MOUNTAIN, in Hampshire County, Mass., between Holyoke and Northampton, and overlooking the Connecticut Valley. Though only 1,214 feet in height, thousands of tourists ascend Mount Tom each year on account of the grand view from its summit.

TOM THUMB. See Straton, Charles Sherwood.

TOM-TOM, or TAM-TAM, a native East Indian drum used by musicians, jugglers, public criers, etc. It is generally cylindrical in form, the depth of body being about three times the diameter of the heads, of which there are two. It is made of resonant wood or of hard-baked earthenware, and the heads are covered with skins, drawn tight by side-lacings, as in the modern drum. It is beaten with the fingers or the open hand and produces a hollow monotonous sound. Similar instruments used by the natives of western Africa receive the name of tom-tom, as do also certain types of Chinese gongs.

TOMAH, Wis., city in Monroe County, on the Chicago, Milwaukee and Saint Paul Railroad, 42 miles northeast of La Crosse. It is the site of a government industrial Indian school and contains the railroad bridge works and a large saw-mill, Pop. about 4,000.

TOMAHAWK, Wis., city in Lincoln County, on the Chicago, Milwaukee and Saint Paul and the Marinette, Tomahawk and Western railroads. It is 23 miles north of Merrill on the Wisconsin River. The principal industries are saw-mills, woodworking plants, pulp and paper factories and a tannery. Pop. about 3,000.

TOMAHAWK, a weapon of warfare of North American Indians, a light war axe. Before the advent of the white traders the head of the axe was usually a piece of stone sharpened at both ends and put through a piece of wood for a handle; sometimes the stone was two-edged and more like a modern double-axe; sometimes hard horn was sharpened and used in the place of the stone. But the white traders brought the natives, iron hatchet heads and the stone ones were gradually discarded. These hatchets had but one cutting edge, the
other shorter end being formed into a hammer-head, or often into the bowl of a pipe, which communicated with a tubular hollow made in the handle, thus made to serve as a pipe. In some instances of burying their tomahawks when they made peace with a foe comes the custom of saying that two opponents who have made peace have "buried the hatchet." (1)

**TOMALES,** to-má-lés, a bay on the coast of California, reaching the ocean, about 40 miles north of San Francisco. It is a narrow inlet of the Pacific, the railroad is near and parallel to its eastern shore, and Tomales Point is on the west, separating the bay from the ocean. The village of Tomales is a short distance inland.

**TOMAN,** or **TOMAUN,** a current gold coin of Persia, varying in value from $1.75 to $2.50 in the market. It is reckoned as the equivalent of 100 shahs or shakis.

**TOMATO,** a perennial herb (*Lycopersicon lycopersicon*) of the family **Solanaceae.** It is a native of western South America, whence it was introduced into cultivation in Europe during the 16th century. At first the wrinkled fruits were regarded with suspicion or disfavor, and were more popular as garden ornaments than for other purposes. During the 18th century both yellow and red-fruited sorts were known, but not until the middle of the 19th century was there a decided improvement in the form of the fruit. At the beginning of that century the fruits were used to a small extent for pickles and preserves, but less for other purposes. The development of the tomato both in its form and its popularity as a vegetable is mainly due to the care of plant breeders, who have eliminated the wrinkles from the fruit, and to the development of perfect methods of canning. The annual consumption of tomatoes, both as a salad and cooked or preserved in various ways, aggregates thousands of tons in the United States, where the crop is more widely grown than in any other country of the world. The season opens in mid-winter in Florida and the Mississippi delta, and advances northward until September, when it ends in Canada. Considerable quantities of tomatoes are forced in greenhouses at various seasons, but especially during the spring months.

Though perennial in its native country and in other frostless climates, the tomato is best known in the temperate regions as an annual herb. It is a straggling, clammy, ill-smelling, grayish-green plant, with variously formed pinnae leaves and small racemes of small yellowish flowers, followed by fleshy many-seeded berries which in some improved horticultural varieties weigh more than a pound. Several botanical varieties have been recognized, among which the following are best known: a *Cherry* tomato (*L. lycopersicon, var. cerasiforme*), grown in gardens for its little yellow or red globular fruits which are used for home-made preserves and pickles; pear and plum tomato (*var. physiforme*), similar to preceding except in form of fruit; large-leaf tomato (*var. grandifolium*), a group of varieties originated during the closing quarter of the 19th century, and including some of the most important commercial varieties; the common tomato (*var. vulgare*), the most widely cultivated form in America. One other species is cultivated more for ornament than for its fruit, which, although edible, is too small for general household raisin tomato. The plant is very spreading and branches, with small egg-shaped leaves and long racemes often bearing more than 30 currant-like red fruits. It has produced hybrids with the preceding species, and is useful for covering unsightly objects during the summer. The former species has been grafted upon to close relative, the potato, but the two plants have never been known to cross-fertilize. These grafts are interesting as curiosities but not otherwise.

Several other plants have been called tomato; the best known are probably the husk tomato (*Physalis pubescens*), also known as the strawberry tomato, ground cherry and dwarf cape gooseberry. It is popular in gardens for its fruits which are made into preserves or kept in their husks in cool dry rooms until needed for use in mid-winter. The name strawberry tomato is also given to *Physalis alkekengi,* better known by its specific name and as the winter cherry or bladder cherry. The red fruits are edible, but are not generally relished. The plant is chiefly ornamental on account of its very showy blood-red calyces. The tree tomato (*Cyphomandra betacea*) is cultivated to a small extent for its light brown, egg-shaped fruits, which resemble the tomato in flavor but are rather more musky and acid.

In cool climates the seeds are generally sown under glass in early spring and pricked out in flats, boxes or pots when the first pair of true leaves appear, allowing them to stand in the former not closer than three by three inches or two by six inches. Abundant ventilation should be given at all times and the temperature kept rather low to make the plants grow stocky and able to adapt themselves readily and without check to the conditions of the field. At this time they are five inches tall. The sturdier the plant, the less is it likely to suffer under ordinary conditions and care when set in the field, the earlier will it commence to bear, and the more profitable will be the fruit.

Whenever possible the tomato should be planted on rather rich loamy soil of medium texture and well exposed to the sun. Good drainage is essential. It is generally best to apply stable manure to previous crops because the applications made during the preceding year are thought to impale the fruits as well as to induce a growth of vine at the expense of produce. In the field the plants are usually set five feet apart each way, and when grown intensively each sixth or eighth plant is omitted and each 15th or 20th is skipped, so as to facilitate hand labor. There is least injury to the vines, waggons, etc., across the field to distribute the vines and collect the fruit. The vines spread and thus prevent tillage, etc., when given weekly to keep the surface from weeds. Often a top dressing of...
readily soluble fertilizer is given after the plants have been in the field about a month. Stem supports and fence for tomatoes are often trained in many ways, especially to stakes, upon slat frames and trellises. For such the plants are subjected to more or less pruning and tying, which usually vary with individual growers but the single stem is usually conceded to be the best method of growing such plants. The advantages secured by training are early ripening and better colored, larger sized and superior flavored fruits.

Since the vines are tender to frost the tomato is usually cut short before mid-autumn. There are, however, at that time many fruits approximately mature, besides large quantities less advanced. The former may be gathered and ripened in warm rooms or sunny windows, and by storing in cool places from which they can be removed to warmth as needed the season may be extended several weeks after the vines have been destroyed. The greener fruits are widely used for making sweet pickles, chow-chow and "India relish."

In greenhouses the tomato is one of the most popular vegetable crops. Though it is often grown in special houses or as the leading crop it is probably more frequently employed as a successor to carnations and some other greenhouse plants, which either commence to fail in the early spring months or have a smaller sale when brought into competition with spring flowers. The fruits are sought for Easter time and from then until the out-door plants commence to bear the greenhouses may often be very profitably employed. Hand pollination is generally considered essential to the setting of the fruit and the labor this involves is often a drawback on account of its expense. The plants are raised usually from seeds, sometimes from cuttings, or the rooted tips of plants which previously occupied the benches. They are planted in soil similar to that in favorable fields, either in solid beds, on shallow benches, or in boxes or pots, the second being preferred. The single plants are usually trained on a single stem supported either by a stout cord suspended from the sabbars, or upon a trellis, the former preferred. Two feet apart is the favorite distance; five feet the preferred height; a minimum temperature of 60° is the lowest night temperature; 65° being preferred by most growers. Abundant light and air must be given at all times, but water must be carefully controlled, especially in cloudy weather, because the plants are apt to grow too rapidly to foliage if water is in excessive supply. During the winter months an average crop of three pounds of fruit to each plant trained to a single stem is considered fairly good. In the spring months four pounds is perhaps below the average. Unless 30 cents a pound can be realized during the winter the crop is rarely paying, and many growers set the profitable figure at 40 cents a pound. In the spring a somewhat lower price with a rather higher average production makes the crop profitable.

The more progressive tomato growers are alive to the fact that the so-called plant diseases which have been reported injurious to the tomato are more readily prevented by intelligent management of the plants than by the use of so-called remedies. Every effort is, therefore, made to keep the conditions in the seedbed as well as in the field as favorable as possible. Adequate ventilation, rather low temperature and limited water supply are found conducive to the health of the seedlings. And sturdiness at the time of setting in the field is a safeguard against subsequent troubles. Growers whose methods produce inferior plants, or who are negligent in various other respects, often suffer serious losses; and perhaps the majority still have recourse to fungicides, none of which have been found fully satisfactory and in some instances have failed completely from the first trial.

Many insects feed upon the tomato, but very few are usually numerous enough to do serious damage. The best known are probably the tomato worm (Helicoverpa armigera) the tobacco-worm (Pheromone carolinus) and various species of cutworms. Flea-beetles, potato-beetles and thrips are also well-known enemies. As a rule, however, they are not responsible for serious damage. Certain species are generally picked off by hand and the smaller are driven away to other plants by the use of repellant and tobacco dust, Bordeaux mixture, etc. See Fungicides; Insecticides.

Consult Bailey, 'Standard Cyclopaedia of Horticulture' (New York 1916); and numerous bulletins of the agricultural experiment stations and of the United States Department of Agriculture.

M. G. KAINS,
Horticultural Consultant.

TOMB, a vault, cavity, niche, excavation or chamber to receive the dead body of a human being; also the monument erected to his memory, or the combined structure that answers both of these purposes. Among Eastern peoples at times the body was left entire and the remains of the dead in excavated chambers or in case the dead bodies were first burnt, to place urns containing the ashes in such chambers. These structures even in times of great antiquity were adorned with appropriate inscriptions. Early tombs often bore character writing, telling of the parentage and the place of residence, perhaps the station of life, of the deceased, and, in the case of heroes, the history of achievement was in all likelihood carved on the walls of the structure. Rude peoples whose only means of written expression was by picture-writing have employed that language to tell of the exploits of dead. Tombs are often designed to contain the remains of more than one person, and of such were the Roman columbarium and the Egyptian pyramids. With some rates tombs were made elaborate objects of art; with others, such as the Greeks, they were highly artistic but simple and tasteful. The stone or flat stone set up to mark a grave was often highly carved, and the stele of Dexileos in Athens is famous. Large edifices built as monuments to the dead are not found in Greece, but were common in the semi-Greek lands of Asia, the most noted being that of King Mausolus of Caria, whence comes the term Mausoleum (q.v.). Roman monuments were of great splendor, as is attested by the few examples remaining to the present time. They were
often of large proportions, the so-called "Castle of Saint Angelo" being nothing else than the tomb of the Emperor Hadrian and his successors, stripped of its sculptures, its marble colonnade, its probable conical superstructure, and crowed with defensive works that made of it a veritable citadel. Other tombs of great splendor are found outside of the walls of Rome and although despoiled and in some instances subverted to the purposes of other, adjacent architectures, they testify to the wealth and the artistic attention which the Romans bestowed on them. Pompeii, too, had its long street of magnificent tombs, which has been partially uncovered outside the limits of the city proper. In portions of Italy and in some of the older Spanish-American towns burial in the cemeteries were made in niches which rose row above row, terrace-like. In the niches rested coffins bearing the bodies. Burial in churches was prohibited during the earlier centuries of Christianity, but from the custom of erecting churches or chapels over graves of martyrs the custom arose to bury monarchs under the cover of the church, and the most important tombs of the Middle Ages are generally so situated. The earlier examples consist of a simple stone coffin of sarcophagus, often with a low, gabled lid and a sculptured cross. Following these come the altar-tombs, in the form of a table, and subsequently, in the 13th century, a species of sarcophagus bearing a recumbent figure of the deceased, the whole surmounted by a canopy, often of exquisite beauty of design. Still more stable are the churchyard tombs of which fine examples are seen in the tombs of La Scala in the churchyard of Santa Maria Antica in Verona. The tombs of the Renaissance period became more and more complex. The sarcophagus was disguised and subordinated to the decorations of sculptured upholstery and groups of symbolic or mythological figures. Immediately following the Middle Ages, the beauty and value of the statuary employed partly compensated for the loss of architectural design, as is the case in Michelangelo's tombs; but in succeeding years this redeeming feature was lost and tomb sculpture rapidly declined. The tomb placed in a niche in a church naturally suggested the memorial tablets of more recent years. The tomb of the Virgin Mary is venerated near Jerusalem, in the Cedron Valley. The sepulcher is completely below the present ground level, and is reached by a stone stairway descending 48 steps. Consult the pamphlet by Jean Baptiste Christyn, "Les tombeaux des hommes illustres," etc. (1674); and the paper by MM. S. Mercier, "Le tombe di Verona" in "Teatro italiano moderno" (Vol. II, 1792).

TOMBAC, an alloy consisting of from about 75 to 80 parts copper, mixed with 15 to 25 parts zinc, and used as an imitation of gold for cheap jewelry. When arsenic is added it forms white tombac.

TOMBIGEE, tom-big'i, a river rising in Tallapoosa County, in the northeast corner of Mississippi, and flowing south to Lowndes County where it enters Pickens County in Alabama. It continues an irregular southern course and unites with the Alabama River, 45 miles north of Mobile, at the point of junction the waters enter Mobile Bay by Mobile (q.v.) and Tensas (q.v.) rivers. Its total length is over 500 miles. It is navigable for 412 miles from Mobile Bay, to Alberti, Miss.

TOMBS, The, a noted city prison in New York. It occupies the entire block bounded by Center, Elm, Leonard and Franklin streets, is connected with the criminal courts by a story closed passage, locally known as "bridge of sighs." The Old Tom built in 1838 was replaced in 1867 structure on the Center street. The old building still standing is nothing of the fine Egyptian arch, the original structure was let for 20 years and the improvements are grand in their being dwarfed into insignificance by the high commercial value of the property. The prison covers a swell between the back of the Grounds and that long dedicated to its internal arrangement is such as which rise in tiers one above the other, used almost wholly for prisoners at.

TOMCOD, or FROST-FISH, a species of the small cod (Microgadus tomcod) of the North Atlantic, usually abundant in the mouths of rivers after the first frosts of autumn, from 4 to 12 inches long, olive green above and silvery below. It is a valued food fish and has several useful relatives on the Pacific Coast.

TOMÉ, Jacob, American philanthropist. Born in York County, Pa., 13 Aug. 1810; died in Deposit, Md., 16 March 1898. In 1833 he settled in Port Deposit, and there acquired a farm in business. In 1864 he entered political life as State senator, being chairman of the Finance Committee, and was instrumenal in reducing the indebtedness of the State to the public welfare, and in promoting public benefit. In 1894 he erected a large gift to Dickinson College, the establishment of a technical school. Jacob Torn Institute, at Port Deposit, he erected at a cost of $1,600,000, and by it will permanently endowed with an equal fortune.

TOMÉ, tô'mě. See Concepción, Colombia.

TOMÉ, a post-village in Valencia City, New Mexico, on the Rio Grande River. In the 16th century it was settled by Spaniards and for years was the seat of an Indian himself, in 1708 it was destroyed by Comanche Indians, since which time it has retained its importance in the locality of about 500.

TOME INSTITUTE. See Jacob Torn Institute.

TOMLINSON, Everett T., American author. Born in Shiloh, N. J., 23 May, 1842, studied at Williams College, and was tutor in various preparatory schools in Eastern and Middle States, but in 1872 devoted himself to literature, part of the time writing of historical and political matters. His publications include: "The Boy Soldier," (1885); "Three Young Cavaliers," (1896); "Tecumseh's Young Braves," (1898); "Washington's Young Aides," (1899); "A Boy in the Revolution," (1899); "Over the Colonial Colors," (1902); "V'

OMMASEO, tōm-ˈma-zō-ˈnoccō, Italio, Italo-historian and philosopher: b. Sebinico, at 1980; d. Florence, Italy, 1874, studied law in Padua but turned to literature and became known as a poet and critic, as well as a leading Florentine writer. He was the first in Europe to publish his work and his style was influential on the development of Italian literature. He went to Paris where he stayed from 1848 to 1874 to publish his great works in literature, his writing was influenced by the French and the Italian language. He was known for his vast and accurate knowledge as a philologist and his constant efforts to educate the people. He was the author of a number of works in Italian.

OMMY ATKINS, a generic nickname applied to British soldiers. It originated many years ago from certain printed forms—enlistment applications and military accounts, where a model, the name "Thomas Atkins" was used, like the mythical "John Doe" of American documents.

OMCHICHI, o-mō-chē-chē, a chief of the southern branch of the Creek Confederacy: the town of Apalachicola, Ga., about 1642; Savannah, Ga., 1739. He withdrew from onfederacy and with his followers went to Ceylon and its tributaries. In 1734 he accompanied the governor on a visit to England.

OMPICKS, Charles H., American soldier: b. Fort Monroe, Va., 12 Sept. 1830; d. Lexington, D. C., 1893. He studied at West Point, but resigned without completing his course. He was graduated from the U.S. Military Academy in 1856. In 1861, he enlisted in the navy and was promoted first lieutenant in second United States Cavalry in 1861. At the outbreak of the Civil War he was assigned to the defense of the national capital and was engaged in one of the first reconnoiter-expeditions. He was particularly distinguished for bravery in the Shenandoah campaign, and was brevetted brigadier-general in 1865. After the war he served as chief qua-re-

TOMPKINS, Daniel D., American statesman: b. Westchester County, N. Y., 21 June 1774; d. Staten Island, 11 June 1825. He was graduated at Columbia College in 1795, and afterward admitted to the bar, but soon entered public life. He was a member of the New York legislature and of the State Constitutional Convention in 1801 and in 1804 was elected to Congress, but was appointed to the State Supreme bench, and accepted that position instead of going to Washington. He was governor of New York in 1807-1817 and in 1817-25 was Vice-President of the United States. He took an active part in the War of 1812, and was one of the strongest and most able opponents of slavery. It was largely through his influence that the bill abolishing slavery in New York was kept before the legislature, but he did not live to see its enactment.

TOMPSON, Benjamin, American poet: b. Brandywine, Mass., 4 July 1762; d. Roxbury, Mass., 13 April 1718. He was graduated from Harvard and was long a teacher at Cambridge. He wrote "New England's Crisis," a long poem of King Philip's War.

TOM'S RIVER, N. J., village, county-seat of Ocean County, on the Pennsylvania and the Central of New Jersey railways, about 50 miles east of Philadelphia, 36 miles southeast of Trenton and four miles from Barnegat Bay. It is one of the colonial villages of New Jersey, and in the Revolutionary days was a haven for privateers. The salt found here made its place of importance in the settlement days. On 24 March 1782 the village was burned by the British. It is now a favorite summer resort. The chief industries are connected with the care of summer guests; but there are considerable shipments of cranberries, farm products, fish and oysters. It contains five churches, four schools and one bank. Permanent population about 1,500.

TOMSK, Asia, in western Siberia, (1) capital of the government of its own name, on the Tom (q.v.). It is the seat of a governor and of a bishop and of the chief town of West Siberia. It has 20 Russian churches, monastery, convent, synagogue, mosque, university with three faculties and 900 students, technological institute, theological seminary and various other schools for both sexes; also various scientific societies, Russian musical society, theatre, library, halting station for exported Russians, banks, harbor, etc. The industrial works comprise tanneries, distilleries, wagon factories, etc. There is a brisk transit trade with Siberia. It lies on a branch of the Siberian Railroad. Tomsk dates from 1604. Pop. about 117,000. (2) The government has an area of about 335,000 square miles and is in the south and southeast mountainous, and embraces the Altai system. The Obi and its tributaries are the chief streams. There are vast swamps in the flat districts. The climate is very cold and unhealthy. Storms and earthquakes occur often. Pop. about 4,000,000.

TON, a measure of weight and capacity, equivalent to 20 hundred-weight. As the historical "hundred-weight" of Great Britain and
the United States contains 112 pounds, the ton is reckoned as 2,240 pounds. This is known as a "long" ton. In some of the States legislation has made the ton consist of 2,000 pounds, being 20 hundred-weight of 100 pounds each. This is known as a "short" ton. United States laws make the ton equal to 2,240 pounds when not otherwise specified. A metric ton is 1,000 kilograms, or 2,204.6 pounds avoirdupois. A ton of earth is the equivalent of 21 cubic feet. As a measure of capacity, of a vessel or a car, a ton is 40 cubic feet; this is an "actual" ton. The "register" ton contains 100 cubic feet. See Tonnage.

Applied to liquid measure the word, in the form tun, was in common use with the old English wine dealers. A tun of beer contained 216 gallons, of 282 cubic inches each, while a ton of wine contained 252 gallons of 281 cubic inches each.

TONALITY, in music, the character and quality of tone. Good tonality demands: correctness of pitch, the production of sounds whose time being termed of doubtful tonality; correctness of intonation; and correctness of key relation, a passage wanting in definiteness of key or scale being termed of uncertain tonality. The word has been adopted by an opera and applied to painting in considering the system of tones, or the color scheme, of a picture.

TONAWANDA, tōn-a-wan'da, N. Y., city in Erie County, on the Niagara River, Tonawanda Creek and Erie Canal, and on the New York Central and Hudson River Railroad, opposite North Tonawanda and 10 miles north of Buffalo. Several railroads pass through and electric lines connect with Buffalo and Niagara Falls. It is in a fertile agricultural region, and on account of the good water power extensive manufacturing interests have been developed. The chief manufactures are steel, lumber and lumber products and paper boards. There are about 75 manufacturing establishments making products of the annual value of $2,300,000. The educational institutions are a high school, public and parish schools and a public library. The two banks have a combined capital of over $300,000. Pop. 9,147.

TONBRIDGE, English market town in Kent, 29 miles southeast of London, on the Medway River. It contains the remains of a medieval castle which stands near the entrance to the town, a parish church and a grammar school founded about 1550. It is noted for the manufacture of a peculiar kind of wooden ware known as "Tonbridge ware." Pop. about 17,500.

TONDO, tōn-dō, Philippines, a district of the city of Manila, the most northern district on the bay shore. The streets are mostly narrow, the houses built of cane and nipa; it contains a large church and convent, the station of the Manil and Dapitan Railroad, and the city slaughter-house. The inhabitants are mostly fishermen and laborers engaged in the tobacco and cigar industries.

TONE, Theobald Wolfe, leader of the United Irishmen: b. Dublin, 20 June 1763; d. there, 1779. He was graduated at Trinity College, Dublin, in 1786, practiced law for a time without much success and gradually politics became his absorbing interest. He held republican opinions, and believed that Ireland ought to assert her rights as an independent nation; but the objects of the clubs of United Irishmen started at Belfast and Dublin in 1791 were limited to legislative reform. In 1792 he was appointed secretary of the general Committee. The government came to know through a spy that he had given information in 1794 on the question of invasion to an emissary of the French government, but they permitted him to leave the country and go to America. He sailed from New York to France in 1795, and urged the French government to undertake an invasion of Ireland. He was adjutant-general in Hoche's abortive expedition against Ireland in 1796, and he afterward served under Hoche on land. He accompanied one of the small French expeditions sent to assist the Irish rebels in 1798, but was taken prisoner after a brief naval engagement near Lough Swilly. He was tried by court-martial at Dublin, convicted of treason, and was executed by firing on 22 March, 1798.

The Toner was issued by Barry O'Brien (1833).

TONE, sound considered with reference to its pitch, timbre, duration and volume. Nearly all tones in music are composite, consisting of several simple constituents having different rates of vibration and known as partial tones. They vibrate according to fixed laws, the pitch depending on the nature of the sonorous body and the mode of producing its vibration. The partial tone having the lowest pitch (and usually the least sound) is called the prime or fundamental tone, while the other partial tones are called harmonics or overtones. Tones differ in quality or timbre according to the number and relative force of their partial tones. A pure tone is a simple harmonic vibration. The seventh tone of a scale is characteristic tone; two tones coalescing are termed combinational. The interval of a major second is called a tone or whole tone, half of such interval being a semitone. When a piano key is sounded it produces the character of that note is a tone; the character of all the notes of an instrument gives the tone of the instrument. See Note: Pitch.

Toner, Joseph Meredith, American physician: b. Pittsburgh, Pa., 30 April 1825; d. Washington, D. C., 1 Aug. 1896. He was graduated at the Jefferson Medical College in 1853 and established himself as a medical practitioner in Washington in 1855. He was the originator of the plan for the American Medical Association Library established in Washington in 1868 and made a part of the Smithsonian Institution, founded the Providence Hospital and Saint Ann's Infant Asylum in Washington and in 1871 the Toner lectures under the auspices of the Smithsonian Institution. He devised the system of symbols for the geographical localities which was adopted by the Post Office Department and made valuable researches into early American medical literature. His collection of 26,000 medical books and 18,000 pamphlets was presented to Congress in 1882. His publications include...
Maternal Instinct, or Love (1864); Medical Register of the United States (1874); Annuals of Medical Progress and Medical Education in the United States (1874); Medical Men of the Revolution (1876). Etc.

Tonga, Tonga, or Friendly Islands, Polynesia, a group of islands under British protection, situated in the south Pacific Ocean, mainly between lat. 18° 30' and 22° 30' S., and between long. 173° and 176° W., southeast of the Fiji Islands and southwest of Samos. They are sometimes classed as three groups, the Tonga-tabu, Haabai and Vavan. The group consists of about 200 islets with a total area of 390 square miles. The largest, Tonga-tabu, is 20 miles long. The islands are partly volcanic and mountainous, partly of low coral formation. They have been subject to considerable changes in modern times by volcanic action. The soil is fertile and the vegetation luxuriant. The chief productions are crops, fruits, mats and sponges. The annual imports and exports total each about $350,000, trade being mainly with Australia and New Zealand. The larger islands are visited every fortnight by the New Zealand Steamship Company. The inhabitants belong to the finest of the Polynesian types. They are peaceful, civilized and Christian, being mostly Wesleyan Methodists. Excellent schools and a college have been established by missionaries. The immediate ruler is King George II and native council, whose capital is Nukualofa on Tonga-tabu. The islands were discovered by Tasman in 1643. In 1845 they were united under one king. In May 1900 they were declared under British protection. Pop. about 24,000, including 380 Europeans.

Tongas, Tonga, a tribe of the Kaluschan stock of North American Indians, residing around Cape Fox and at the mouth of Portland Canal, southeastern Alaska. They number about 250.

Tongres, Tongr, Belgium, a town in the province of Limburg, on the Geer, 12 miles north of Liege. The church of Notre Dame (1240) is the first dedicated to the Virgin in the north. The cloister belongs to the 10th century. The industrial works include tanneries, distilleries and hat manufactories. The population before the war was about 10,000.

Tongue, the principal organ of the sense of taste and an essential part of the apparatus of speech in human beings. The name tongue is also given to various structures in invertebrates, as the proboscis of a lepidopter or the odontophore of a shellfish. In man the tongue is attached by its base or root to the hyoid bone and to the epiglottis. Its tip, sides, upper surface and part of its under surface are free. Its under surface is fixed to the lower jaw by the genio-hyoglossus muscles and from its sides the mucous membrane is reflected on the inner surface of the gums. In front of the under surface a fold of the mucous membrane is specially developed and is named the frenum lingue. The upper surface is convex and bears a deep middle line, the raphe, which ends behind in a deep follicle or sac—the foramen cecum. Two-thirds of the forward portion of the organ are rough and bear the characteristic structures known as papillae, in which the sense of taste resides. The posterior third is smooth and exhibits the openings of numerous mucous glands. The substance of the tongue consists of large numbers of muscles, which are named superior and inferior longitudinal and transverse muscles. The mucous membrane consists of an upper layer or cutis supporting papillae and covered with epithelium. This cutis supports the blood-vessels and nerves and into it the papillae of the tongue are inserted. The papillae, which cause the characteristic roughness of the tongue, are of three kinds. The circumvallate papillæ number from eight to 10. They are of large size and are placed on the hinder part of the upper surface and extend from the raphe in two diverging lines. Each of these papillae consists of a rounded central and flattened disc, situated in a cup-shaped depression or fossa. The exposed part of the papilla is itself covered with numerous papillæ. The fungiform papillæ are more numerous than the circumvallate and are scattered irregularly over the upper surface of the tongue, but are most plentiful on its apex and sides. They are of large size, of rounded prominence, and are of a deep red color. The filiform or front papilla are of very small size and are arranged in rows corresponding with the rows of the circumvallate papillæ. In structure the papillæ are like those of the skin (q.v.) and contain loops of capillary vessels as well as nervous filaments. The mode of termination of the nerves in the papillæ is hardly determined. Numerous follicles and mucous or lingual glands exist on the tongue, the functions of these latter being the secretion of mucus (q.v.). The epithelium (q.v.) of the tongue is of the flat or scaly kind, resembling that of the epidermis or outer skin, but the deeper cells of the epithelial layer do not contain any pigmenitary or coloring matter. The muscular halves or substance of the tongue are divided in the median line by a fibrous septum. The arteries are derived chiefly from the lingual and facial trunks and the nervous supply is distributed in the form of three main nerves to each half of the organ. The gustatory branch of the lingual nerve supplies the papillæ in front and those of the sides. The lingual branch of the glossopharyngeal nerve supplies the mucous membrane at the sides and base and also the circumvallate papillæ, while the hypoglossal nerve is distributed to the muscular substance of the organ.

The gustatory nerves and glossopharyngeal branches are the nerves which provide the tongue with common sensation and also with the sense of taste, the hypoglossal nerve being that which invests the muscles of the tongue with the necessary stimulus. The conditions which appear to be essential for the exercise of this sense are: (1) the solution of the matters to be tasted—that is, their presence in a form in which their particles may readily come in contact with the nerves of taste, there being thus a strong analogy between the sense of taste and that of touch, since the latter sense must be in a manner exercised before the taste of any substance can be perceived; (2) the presence of a specialized gustatory nerve, a necessary condition for the exercise of this sense. Occasionally it happens, however, that other stimuli than those produced by the actual
contact of sapid substances with the nerves of taste may excite that sense. If a current of cool air be directed on the tongue a saline taste is perceived; and a smart tap on the tongue will produce a taste analogous to that excited by electricity. A minute current of electricity can be detected by the tongue which is not observable by the eye or hand. It appears necessary that the surface of the tongue itself should be moist, in order that the gustatory sense may be exercised, and hence the inability to taste substances when the palate and fauces are dry and parched. The tongue itself does not appear to be the exclusive seat of this sense. The soft palate, uvula, tonsils and upper part of the pharynx in all probability exercise this sense, although in a minor degree when compared with the tongue. The middle of the tongue appears to be most feebly endowed with the sense of taste, the most sensitive region of the organ being the tip and edges. The tongue may occasionally lose its sense of taste and retain its sensibility to touch, or vice-versa. Surprisingly, the taste is not the same in every part of the tongue. While some substances taste alike when touched by every part of the tongue, other substances taste differently when applied to different parts of the tongue. Sensations of taste, or at any rate of the impressions of taste, may remain for long periods after the stimulus has disappeared, while the frequent repetition of the same taste dulls the sense. This sense may also be excited by internal stimuli as well as by those of external kind.

In the articulation of words, the modulation of sounds, the tongue plays an important part among the organs of speech; and in mastication, swallowing and nearly all the actions performed by the mouth the tongue is more or less concerned.

Various mechanical devices and structures thought to resemble the human tongue in some respect are so named, as the pole of a wagon, the fastening pin of a buckle, a vibrating slip in a musical reed, the tang of a tool, a strip of leather for closing the front gap in a laced shoe, etc.

**TONGUE-FISH,** an English name, corrupted from the French *tongue,* applied to young soles and other small edible flatfish found along the shores of the English Channel. The term has been applied by Jordan to the American genus *Sphyrnus* of sole-like fishes occurring on both United States coasts.

**TONGUE-TIE,** an abnormal attachment or adhesion of some part of the tongue to some portion of the surrounding structures of the mouth. The ordinary form of tongue-tie consists in an abnormal development of the frenum. The tongue, in consequence, cannot be extended beyond the lips, and speech and mastication, as well as speech, are impeded.

**TONGUES,** Confusion of, the punishment inflicted on the builders of Babel, according to the Biblical narrative, when God so confounded their language that they could not understand each other, though up to that time there had been only one language. The result was that the building of the tower was abandoned, and those who had been engaged in its erection were dispersed over various lands (Gen xi, 1-9).

**TONGUES,** Gift of, a gift bestowed in connection with the Pentecostal descent of the Holy Spirit. A saline taste is perceived; and a smart tap on the tongue will produce a taste analogous to that excited by electricity. A minute current of electricity can be detected by the tongue which is not observable by the eye or hand. It appears necessary that the surface of the tongue itself should be moist, in order that the gustatory sense may be exercised, and hence the inability to taste substances when the palate and fauces are dry and parched. The tongue itself does not appear to be the exclusive seat of this sense. The soft palate, uvula, tonsils and upper part of the pharynx in all probability exercise this sense, although in a minor degree when compared with the tongue. The middle of the tongue appears to be most feebly endowed with the sense of taste, the most sensitive region of the organ being the tip and edges. The tongue may occasionally lose its sense of taste and retain its sensibility to touch, or vice-versa. Surprisingly, the taste is not the same in every part of the tongue. While some substances taste alike when touched by every part of the tongue, other substances taste differently when applied to different parts of the tongue. Sensations of taste, or at any rate of the impressions of taste, may remain for long periods after the stimulus has disappeared, while the frequent repetition of the same taste dulls the sense. This sense may also be excited by internal stimuli as well as by those of external kind.

In the articulation of words, the modulation of sounds, the tongue plays an important part among the organs of speech; and in mastication, swallowing and nearly all the actions performed by the mouth the tongue is more or less concerned.

Various mechanical devices and structures thought to resemble the human tongue in some respect are so named, as the pole of a wagon, the fastening pin of a buckle, a vibrating slip in a musical reed, the tang of a tool, a strip of leather for closing the front gap in a laced shoe, etc.

**TONGUE-FISH,** an English name, corrupted from the French *tongue,* applied to young soles and other small edible flatfish found along the shores of the English Channel. The term has been applied by Jordan to the American genus *Sphyrnus* of sole-like fishes occurring on both United States coasts.

**TONGUE-TIE,** an abnormal attachment or adhesion of some part of the tongue to some portion of the surrounding structures of the mouth. The ordinary form of tongue-tie consists in an abnormal development of the frenum. The tongue, in consequence, cannot be extended beyond the lips, and speech and mastication, as well as speech, are impeded.

icient remedy in most forms of anaemia, always easily assimilated and it is gen-
title in chronic wasting diseases and in affec-
tions.

IIKA, tön-ka (also TONICA and A), a tribe of North American Indians, a
distinct linguistic stock, and for-
siding on the Lower Yazoo in Missis-
tuck were first described by De Soto (1492).
They were allies of the French in their contests with neighboring
and in 1699 were reported to occupy 200
estuaries over four leagues. In 1706
re driven away by the Chickasaws and is,
and in 1730 were defeated by the
, who burned their village and killed a
of them. The remainder retired to the
Mississippi, where, in 1760, they occupied
ages, and in 1802 numbered about 400
The Tonikas were an agricultural tribe;
tended their heads and wore very little;
the women made pottery and a fabric
e mulberry. Polynesian was not com-
here are a few survivors of
, near Marksville, La., who speak their
unguage as well as Creole and English.

IK, India, a small native state of the
east of Ajmer-Merwara. Area,
tare miles; pop. about 303,000. It yields
an annual revenue of about $650,000.
ital, Tonk, about 60 miles south of as a population of 55,000.

IKA, tön-ka, Lower Siam. See PUKET.

IKA, TONCA, TONGA, or TON-
BEAN, is the fragrant seed of the
bush tree Diptera odorata, native to the
countries of South America. The tree
80 feet in height and bears fruits which
dike, oblong and fibrous and contain a
red. This is of the shape of an almond,
ter, in a shining black coat. Tonka
ve the fragrance of new-mown hay, due
one odorant principle, prismatic couma-
tse sweet vernal grass and melilot. They
for their aroma, either whole or pow-
er scenting clothes, snuff and in perfume-
evaporate as a substitute for vanila.

IKAWA, tön-ka-wä, a nomadic tribe of American Indians, comprising a
disguising stock. They formerly roamed the plains of Texas, were noted for their
istics and practices and were regarded as the
ranging tribes. Early in the
tury they were reported to number be-
000 and 3,000, but in 1857, when they
lled on a reservation on the upper River, in Texas, their number was offi-
mated at fewer than 1,000. During the
ar (5 Jan. 1862), owing to their refusal to Comanches, Delawares and others in
ction against the whites, the latter In-
tacked a party of some 200 Tonawas,
ng more than half the tribe, killing all
The remainder returned to Texas
ney stayed until 1884, when they were in a reservation in Oklahoma. Here the
ors now live with the Poncas.

KIN, tön-ken', TONKING, or CING, French Indo-China, a territory
reach position. Located on the north
a, on the east by the Gulf of Tonkin,
ish by Anam and on the west by Laos.

Area, 46,400 square miles. It is divided into 14 provinces and includes about 8,000 villages. It
consists of two mountainous regions surround-
ing on three sides the large alluvial plain and delta-region of the Song-koi (Red River), also an
intermediate region of plateaux. The Song-
koi flows through the centre of the territory from northwest to southeast and opens a naviga-
le waterway extending in the rainy season as far as Lao-kay. The Song-koi (known as the Black River)
ris in Yunnan and joins the Song-koi, the
largest river in the Mekong, forming a large
portion of the western boundary. The principal
eral resources are deposits of coal, iron,
copper and gold. The climate is hot and humid
and the alluvial plain of Tonkin produces some
of the best rice in the word. Sugar, cotton,
te, Indian corn and opium are also cultivated
to a great extent, and on the higher ground
there are coffee plantations. The manufacturers
clude silk, paper, cotton and textiles.
Commerce has rapidly increased, the ex-
ports, chiefly rice, maize, sugar cane, silk, cot-
ton, coffee, tobacco and animal products
ounting to about $10,000,000 annually. The
imports in 1915 totaled $5,000,000, being
ance, machinery and beverages. The principal
port is Hai-fong, which has steamship connec-
tion with Hongkong, Yokohama and Cochin-
China. Railroads run from Hanoi to Hai-fong
and Nam-dinh to Lungchow and to Yunnanfu
and to the Chinese frontier. There are ocean
ables connecting with Hongkong and Hue.
Hanoi is the capital, and, since 1902, also the
capital of the whole of French and Indo-China.
Tonkin was an independent state until 1802,
when it became a province of Anam. The lat-
ter is still its nominal position, although the
Anamite vice-royalty was superseded in 1897
by a French residency, and the French protec-
torate is more direct here than in Anam proper.
The provinces are governed by a resident and
vice-resident, and each is subdivided into four
military territories under commandants. Pop.
estimated in 1911 as 6,119,720, with 33,000 Chi-
inese and 6,132 Europeans.

TONKIN, Gulf of, Indo-China, an arm of the
Sea extending northward between the
French Indo-China and the Chinese island of
Hainan. It is about 400 miles long and 200
miles wide. It forms the coast of the protec-
torate of Tonkin and receives the commerce
brought down by the important river Song-
koi from a rich agricultural region.

TONKS, Oliver Samuel, American teacher of art: b. Malden, Mass., 24 Dec. 1874. He was graduated at Harvard University, where he
ook his Ph.D. degree in 1905, and was a
ellow of the American Classical School at
thens (1901-02). He served as assistant
curator of the department of classical art in the
Boston Museum of Fine Arts (1903), was in-
structor in Greek at the University of Vermont
(1904), lecturer at Columbia (1905) and pre-
ceptor in art and archaeology at Princeton
(1905-11). He then became professor of art in
Vassar College. He collaborated in writing "The Art Museum and the Public School" (1912).

TONNAGE, the carrying capacity of a
ship. As this capacity is variously measured
the word has several special meanings. As it comes
from the shipyard the ship's capacity is rated as "dead weight tonnage." As it is measured by maritime surveyors and registered as of so many tons, its capacity is the same as "gross registered tonnage" and "net registered tonnage," both figures being given, as in different ports dues are collected variously, sometimes on the gross and sometimes on the net tonnage. War vessels, which have no "carrying capacity" in the mercantile sense, are rated by their "displacement tonnage." Still another form is recognized among shippers as "cargo tonnage" or "measurement tonnage."

Displacement Tonne is the weight of sea water actually displaced by the vessel. It is computed usually by calculating from the drawings of the ship by the naval architect the cubic content of the immersed hull in feet and adding to that figure the number of cubic feet in the propeller, the shafting exterior of the hull, the engine, and the superstructure. This total is divided by 35, as 35 cubic feet of sea water weigh almost exactly one ton.

In ascertaining the carrying capacity of a ship under the old style of measurement (almost four-fifths), the depth of the vessel was assumed to be the same as its breadth and the tonnage was obtained by multiplying the length by the breadth by the depth and dividing the product by 94, the quotient being the tons burden. But this rule was found to be impracticable, since shipbuilders sought to evade tonnage and harbor dues by building their ships very narrow and deep. In 1835 the British Parliament remedied these defects by new measurement laws, which were amended by the Merchant Shipping Acts of 1854 and 1894. Under this system, known as the Moorsom, actual measurements of the depth of the vessel are made at certain intervals, the number of which depends on the length of the tonnage deck, and at these points transverse areas are computed.

Gross and Net Registered Tonnage.—For purposes of measuring tonnage the United States practice divides vessels into six classes based upon their length (the British into five). These lengths and the number of longitudinal sections into which they are respectively divided are as follows: I, vessels under 50 feet long, into six parts; II, between 50 feet and 100 feet, into eight parts; III, between 100 and 150 feet, into 10 parts; IV, between 150 and 200 feet, into 12 parts; V, between 200 and 250 feet, into 14 parts; VI, over 250 feet, into 16 parts. These divisions are set out on the "tonnage deck," which in a vessel with less than three decks is the upper deck; in a vessel with three or more decks is the second deck, counting from below. The depth of the vessel is measured on its centre line from the inside of the innermost plate or plank at the bow to the innermost side of the plate at the stern, but making allowance for rake. The stations being marked off at every 3 feet 6 inches, the product of the transverse areas are made at each station, the depth being first taken. This is the distance from one-third up the round of the beam at the bottom to the top of the deck beams, allowing two and one-half inches for each. If this depth at midship is more than six feet the figure representing the depth is divided into six equal parts and a transverse measurement is made at each division, and and the bottom. Counting from one second, fourth and sixth measurement multiplied by four, and the above the second multiplied by two. These products are added together, and to the sum thus obtained added the top measurement and the measurement. This total is then multiplied by one-third of the equal vertical distance which the depth was divided, and this is accepted as the transverse area at that point. These transverse areas are numbered successively from the bow to the stern. Omit first and last second, fourth and sixth succeeding area with an even number is multiplied by one; and the third, fifth and seventh succeeding area with an odd number is multiplied by two. These several products are added together and the first and last also; and the sum is then multiplied by one-third of the two equal longitudinal distances between stations. The total is the cubic content of the vessel in feet. This figure is divided by 100 and the quotient is the gross tonnage. To this is added the number of feet in all deck houses and permanently enclosed spaces which are above the main deck, and which are or may be used as regular cabins or as not available for fuel, stores or water. These additions are divided by added to the underdeck tonnage to gross registered tonnage. The net tonnage is computed by deducting from the full cubic content of the engine room, including the shaft tunnel, the crew houses, the coal bunkers, the carpenter's rooms, the spare parts, and all space needed in the navigation of the ship, and such part of the space in the cargo area as is not available for fuel, stores or water. The resulting product is multiplied by 0.25 per cent and added to the net tonnage. The result is the common practice to compare the gross tonnage with the gross tonnage and if it is from 20 to 25 per cent and under 20 per cent, the arbitrary deduction of 32 per cent for a vessel under 37 per cent for a vessel over 37 per cent for a vessel over 37 per cent, making the figure for the net tonnage. The deductions from the gross tonnage are the result of a long process of arbitration. The rule carries its gross tonnage figures as 'net figures for the calculation of canal dues by the local authorities.
OWN FOR MEASUREMENT, AS THEY HAVE TO DEAL WITH VESSELS OF ALL NATIONS. UNDER MODERN RULES ACCOUNT IS TAKEN OF THE SPACE IN DOUBLE BOTTOMS, NOW COMMONLY UTILIZED FOR FEED, WATER, OIL, FUEL, ETC., AND NO ALLOWANCE OF MORE THAN 5 PER CENT OF THE GROSS TonnAGE FOR CREW SPACE IS COUNTENANCED. DECKHOUSES, HOWEVER, WHICH ARE USED ONLY AS LOUNGING ROOMS FOR PASSENGERS ACCOMMODATED ELSEWHERE IN THE VESSEL ARE ALSO DEDUCED IN ARRIVING AT NET TONNAGE.

TOMONETER, IN MUSIC, AN INSTRUMENT FOR MEASURING THE PITCH OF TONES, SUCH AS A TUNING FORK OR A SET OF GRADUATED TUNING FORKS. THE BEST-KNOWN TONOMETER WAS INVENTED BY SCHEIBLER IN 1834, AND WAS SUBSEQUENTLY IMPROVED BY KÖNIG. IT CONSISTED OF AN EXCEPTIONALLY PERFECT SET OF TUNING FORKS WITH AN APPEARANCE FOR DETERMINING THE EXACT NUMBER OF VIBRATIONS PER SECOND PRODUCED BY A GIVEN TONE. AN INSTRUMENT FOR MEASURING TENSION IN A LIQUID, OR OF THE EYEBALL, IS ALSO TERMED A TONOMETER.

TONSON, JACOB, ENGLISH PUBLISHER: B. LONDON, 1656; D. THERE, 2 APRIL 1736. IN 1678 HE OPENED HIS SHOP AT THE JUDGE'S HEAD, CHANCERY LANE. HIS WORKS INCLUDED THOSE OF THE PUBLISHER OF DRYDEN'S WORKS, AND CONTINUED IN SUCH AS MANY YEARS. IN 1690 HE COMPLETED THE PURCHASE OF THE PUBLISHING RIGHTS OF 'PARADISE LOST,' AND AFTERWARD CLAIMED THAT HE MADE MORE ON THIS WORK THAN ON ANY OTHER. ABOUT 1700 HE REMOVED HIS SHOP TO A PLACE IN GRAY'S INN GATE. WHEN THE KIT-CAT CLUB (Q.V.) WAS FOUNDED HE WAS MADE ITS SECRETARY. HE PURCHASED A HOUSE AT BARN ELMS AND PROVIDED A ROOM THERE FOR THE MEETINGS OF THE CLUB. IN 1710 HE MOVED TO THE SHAKESPEARE'S HEAD. HERE HE CONTINUED UNTIL HIS RETIREMENT FROM BUSINESS IN 1720. HIS NAME IS ASSOCIATED WITH NEARLY ALL THE LITERARY MEN OF HIS TIME; WITH POPE, WHOSE PASTORALS APPEARED IN TONSON'S 'MISCELLANY,' (1709); WITH ADDISON, FOR WHOM HE PUBLISHED 'CATO' (1713) AND FOR A TIME ISSUED THE SPECTATOR; WITH CONGREVE, STEELE, WALLER, ETC. WYCHERLEY SPOKE OF HIM AS HAVING LONG ACTED AS GENTLEMAN-usher TO THE MUSES. HE PUBLISHED ROWE'S EDITION OF SHAKESPEARE (1709).

TONTINE, tōn-tīn', A FORM OF ANNUITY OR FINANCIAL ASSURANCE IN WHICH GAIN ACCRUES FROM SURVIVORSHIP. THE NAME IS DERIVED FROM THE NAME OF LORENZO TONTI, A NEAPOLITAN WHO SETTLED IN PARIS IN THE TIME OF CARDINAL MAZARIN AND WHO INVENTED THIS STYLE OF LIFE ANNUITY. TONTI PROPOSED THE SYSTEM TO THE FRENCH GOVERNMENT AS A METHOD OF RAISING FUNDS WHILE THE PLAN WAS NOT ADOPTED, STILL IT SERVED AS A MODEL ON WHICH ALL FUTURE TONTINES WERE OPERATED. THE MEMBERS OF TONTI'S ASSOCIATION WERE TO SUBSCRIBE THE SUM OF MONEY NEEDED BY THE GOVERNMENT AND TO RECEIVE LIFE SHARES IN THE SOCIETY. THERE WERE TO BE 10 CLASSES OF SUBSCRIBERS, ACCORDING TO THEIR AGE, AND FOR EACH CLASS A FIXED SUM WAS TO BE DIVIDED YEARLY AMONG THE MEMBERS OF THE CLASS. WHEN A MEMBER DIED HIS SHARE WAS DIVIDED WITH THE REST AMONG THE MEMBERS OF THE CLASS SO THAT THE DEATH OF EACH MEMBER BENEFITED ALL THOSE REMAINING, AND THE PROFIT TO THE LAST FEW SURVIVORS IN EACH CLASS WAS ENORMOUS, WHILE THE SOLE SURVIVOR RECEIVED THE ENTIRE SUM OF INTEREST ACCRUING TO HIS CLASS. UPON HIS INTEREST CEASING AND THE BORROWER OBTAINING THE CAPITAL. IN 1689-92 THE SYSTEM WAS USED BY LOUIS XIV, WHO WAS SOLELY IN NEED OF FUNDS. HE ORGANIZED A TONTINE WITH A CAPITAL OF $70,000,000, WHICH LASTED FOR A PERIOD OF 40 YEARS. THE SOLE BORROWER FOR AN ANNUAL INTEREST OF $367,500 FROM HIS ORIGINAL INVESTMENT OF $1,500. DURING THE FOLLOWING CENTURY THE TONTINE WAS FREQUENTLY USED IN FRANCE AND IN GREAT BRITAIN, AND IN AT LEAST ONE INSTANCE IN THE UNITED STATES, IN ORDER TO RAISE LARGE SUMS OF MONEY. A DISASTER PRIVATE TONTINE IN FRANCE, KNOWN AS THE "CAISSE LAFARGE," WAS ESTABLISHED IN 1791. WHEN 60,000,000 FRANCS HAD BEEN SUBSCRIBED INTO THE COMPANY IT WAS FOUND THAT EITHER THROUGH GROSS ERROR OR FRAUD THE INTEREST PROMISED WAS AN IMPOSSIBLE ONE AND THE SUBSCRIBERS Owing TO THE FINANCIAL PANIC THEN PREVAILING LOST NOT ONLY THEIR INTEREST BUT THEIR CAPITAL AS WELL. THE LAST PUBLIC TONTINE IN ENGLAND WAS OPENED IN 1789 AND THE INTEREST, AMOUNTING TO $210,150, WAS PAID AS LATE AS 70 YEARS AFTER THAT DATE. THE IRISH TONTINES, ESTABLISHED 1773-77, DREW AS MANY AS 3,500 MEMBERS. TONTINES IN THE UNITED STATES WERE AT ONE TIME POPULAR AS A MEANS FOR RAISING MONEY FOR THE ELECTION OF LARGE QUINQUENNIAL TAXES. THE NEW YORK TONTINE SOCIETY, FOUNDED IN 1790, WAS WOUNDED IN 1870-78, WHILE TONTINE BUILDINGS WERE ERECTED IN NEW YORK, NEW HAVEN, ALBANY AND OTHER AMERICAN CITIES.

ALTHOUGH TONTINES IN THEIR OLD FORM WERE LONG AGO ABANDONED BY FINANCIERS, THE TONTINE SYSTEM AS APPLIED TO LIFE ASSURANCE HAS GIVEN RISE TO AN IMPORTANT MODIFICATION OF THE USUAL INSURANCE POLICIES. WHAT IS KNOWN AS THE TONTINE DIVIDEND POLICY HAS THE FOLLOWING DISTINCTIVE FEATURES: THE HOLDERS OF SUCH POLICIES CONSTITUTE A CLASS BY THEMSELVES; THEY DO NOT PARTICIPATE IN PROFITS UNTIL AFTER THE LAPSE OF THE TONTINE PERIOD, USUALLY 10, 15 OR 20 YEARS; THE REPRESENTATIVES OF THE INSURED IN CASE OF HIS DEATH BEFORE THE COMMENCEMENT OF THE DIVIDEND PERIOD RECEIVE ONLY THE SUM MENTIONED AS THE FACE VALUE OF THE POLICY; NO SACRED VALUE IS ALLOWED TO ANYONE WHO RELINQUISHES HIS POLICY BEFORE THE DIVIDEND PERIOD AND ALL PROFITS FROM WHATSOEVER SOURCE ARE RESERVED UNTIL THAT PERIOD, WHEN THE ACCUMULATED DIVIDENDS ARE TO BE
equitably divided among the holders of such policies as are then in force. This form of policy has been practised by various societies. For further information consult F. De Pesster's 'History of the Tontine Building' (1855). See INSURANCE.

TONTO (Spanish, 'foolish'), an inappropriate name applied by the Spanish colonists of Arizona in the 19th century to a number of Indian tribes, namely: (1) To the Tukalpa, a tribe of the Yuman stock settled in 1875 on San Carlos reservation, Arizona. (2) To the Eyo-tero Apaches, an Athapascen tribe. (3) To the Papago of the same stock. (4) To a mixture of Yavakai (Yuman) men and Pinal women who had intermarried. The name has been especially applied to a well-known body, the former occupied Tonto Basin and the Pinal Mountains of central Arizona, where some 500 of them were removed to the Rio Verde reservation and later to the San Carlos reservation. They number about 700, and speak a mixed Yuman-Athapascan language.

TONTY, tonté, or TONTI, Henri de, French explorer: b. about 1650; d. Fort Louis (Mobile), September 1706. He was a son of Lorenzo Tonti. He entered the French army, served also in the navy, and in 1678 came with La Salle (q.v.) to Canada, went with him into the Illinois country in 1680, undertaking the first civilized occupation of that region, and was placed in charge of Fort Crèvecoeur, a little below Peoria, where La Salle left him. In 1681 he joined La Salle at Michilimackinac, and with him descended the Mississippi to its mouth. Subsequently he was in command of the stronghold called "Starved Rock," by La Salle Fort Saint Louis, and in 1688, after La Salle's death, unsuccessfully attempted the rescue of the French colonists left in Texas. "There are very few names in French-American history," says Parkman, "mentioned with such unanimity of praise as that of Henri de Tonti." He wore a metal band with which he so effectually disarmed the Indians on occasions that they thought him a god. Consult French, 'Historical Collections of Louisiana' (Vol. I, 1846); Parkman, 'The Discovery of the Great West' (1849; new ed., 1898).

"TOO PROUD TO FIGHT," an expression used by President Wilson in the course of an address delivered to 4,000 newly-naturalized American citizens in Convention Hall, Philadelphia, on 10 May 1915. Torn from its context, this now historic phrase accumulated a large amount of more or less intentional misinterpretation. The sentence immediately following it contains the real gist of the President's meaning: "There is such a thing as a man being too proud to fight. There is such a thing as a nation being so rich that it does not need to convince others by force that it is right.

TOOLE, Utah, county-seat of Tooele County, on the San Pedro, Los Angeles and Salt Lake and the Tooele Valley railroads, 45 miles southwest of Salt Lake City. The industries include a large smelter, a flouring mill, saw mills, and a creamery. It has a Carnegie library. Pop. about 3,400.

TOOKIE, John Horne, English polychist and philologist: b. Westminster, 25 June 1718; d. Wimborne, 18 March 1812. He was educated at Westminster and at Eton, whence he was removed to Saint John's College, Cambridge. In 1756 he entered himself as a Inner Temple; but in 1760 he took orders. He was a warm opponent of the American war and was prosecuted for sedition for the working of a resolution by which the Constitution Society voted £100 to the widows and children of the Americans "murdered by the king's troops," in the battle of Lexington. For the anonymous paragraph he was in 1777, and sentenced to a year's imprisonment and a fine of £200. In 1780 he published a keen review of Lord North's administration, in a pamphlet entitled 'Facts,' and in 1782 a 'Letter on Parliamentary Reform.' It was in 1782 that he took the name of "Tooke," being previously known as John Horne. This came about through his being named as heir to William Tooke, a wealthy gentleman of Surrey. In 1786 he published in a quarto work entitled 'Epea Pteroenta' (Greek for 'Winged Words'), or the 'Divisions of Purley.' In 1801 he accepted the seat for Old Sarum. His political life closed with the dissolution of Parliament in 1802. Tooke possessed considerate learning. His 'Epea Pteroenta' is original and ingenious, and has exercised considerable influence on the subsequent development of philological investigation.

TOOLE, John Lawrence, English comedian: b. London, 12 March 1832; d. Brighton, 30 July 1906. He was educated at the City of London School. After he was tried at the Old Bailey for a wine-merchant's clerk he took to the stage, and made his first appearance at the Haymarket in 1852. He then played with great success in Dublin, Belfast, Edinburgh and Glasgow, and ultimately became a popular favourite everywhere. In 1880 he began the management of the Folly Theatre, London, which he afterward reconstructed and named after himself. In 1874 he visited America, and in 1888 he published his 'Ruminiscences,' and in 1890 made a successful tour in Australia. He was one of the most popular actors on the stage, inimitable in his personation of semi-pathetic, semi-ludicrous characters. Among his most successful parts were Paul Pry, Caleb Plummer in the 'Cricket on the Hearth' and Uncle Dick in 'Uncle Dick's Darling.' One of his latest parts was that of Walker in Barr's 'Walker, London.'

TOOLE, Joseph Kemp, American lawyer and state executive: b. Savannah, Mo., 2 May 1831. He removed to Montana, became established as a lawyer in 1870, and served two terms as district-attorney. He was a member of the Territorial legislature in 1879, and of Congress, 1884-88. He was elected to the Constitutional Convention in 1889, was the first governor of the new State of Montana in 1889-93, and was re-elected governor in 1900 and 1904 but resigned 1 April 1908; and retired into private life.

TOOLS. The almost innumerable variety of mechanical appliances and devices which are included under the general term "tools" may be primarily classified into three important groups...
TOOLS

or the portion of a structure is truly horizontal or truly perpendicular.

Plumb-level.—This is a cord attached to the exact center of the upper end of a vertical straight-edge. A weight suspended from the lower end of the cord swings freely in a pear-shaped hole near the lower end of the straight-edge. A straight line is marked on the straight-edge from the center of the pear-shaped hole to the point of attachment of the cord. In testing the perpendicularity of a surface, one edge of the straight-edge is placed against the surface under test and the coincidence of the cord with the line marked on the straight-edge is carefully noted.

Gauges.—Three common kinds of gauges are used in carpentry work—the marking gauge, the cutting gauge and the mortise gauge. The marking gauge consists of a head or block which slides along a shank about nine inches long. A spike is inserted near the end of the shank and the movable head is provided with a screw or a wedge by which it may be fixed at any required distance from the spike. It is used for the purpose of making a mark on a piece of wood parallel to an edge which has been previously straightened and along which the head of the gauge is guided while the spike inflicts the mark. It is very useful in dressing several pieces of wood to exactly the same breadth. The cutting gauge is similar to the marking gauge in all respects with the exception of the spike which is replaced by a thin steel plate. This plate passes through the shank and is held in place by a set-screw and is sharpened on one edge so that it is capable of cutting either with or across the grain. It is used for gauging dovetailed work and for cutting veneers to equal breadths. The mortise gauge is also similar to the other two gauges but it is provided with two spikes, one fixed and the other movable and capable of being adjusted at different distances from the fixed spike by means of a set-screw. It is used for the purpose of gauging mortise and tenon work. Compound gauges consisting of combinations of cutting and marking gauges or of marking and mortise gauges are also commonly used for the purposes designated.

Bevels.—These are made somewhat like the squares, but with the exception that the blades are attached to the stock by a pin which permits of their being set at any angle other than a right angle, and held in such position by a thumbscrew; they are used for the purpose of marking lines at such angles to the first side of the piece of work. In some forms the blade is slotted through a part of its length and is called a sliding bevel. Others such as the boat-builder's bevels have two brass blades, one at each end of the stock, while in the protractor bevel the sliding arm works through a semi-circle graduated into degrees.

Mitre-box.—This is a device for guiding a saw so that it will cut at some regular angle, as 45 degrees. In its simplest form it is a rectangular box composed of two equal pieces of solid wood, fastened to the bottom. A saw-cut made at an angle of 45 degrees through the sides guides the saw when it is employed to cut a piece of wood such as a picture molding placed in the mitre-box. One of the most important things is to understand that those at an angle of 45 degrees may be marked in the same box by cutting the guiding cuts at the
required angles through the sides of the box. The most convenient form of mitre-box for cutting a wide series of angles is one provided with movable guides which may be readily set at the required angles. As a rule, the mitre-edges of the moldings are left rough from the saw so as to make the glue adhere more firmly, but where sawed mitre-work requires to be planed smooth it is planed up with a "shooting-board" which consists of two pieces of wood screwed together so as to form a step, on the up-sloping outer side of which two strips of wood are screwed at right angles to each other. These strips act as guide-bars against which the piece of molding to be mitred is held and then planed off on the edge of the step.

**Compasses and Calipers.**—These devices are made of metal and are employed for the purpose of taking dimensions such as the inside and outside diameters of pipes and other cylindrical work that cannot be taken accurately with a rule. A compass consists of two long parallel thin needles which slide in a brass or iron joint. In the form called a "wing-compass," it is provided with a metal arc and a set-screw attachment which permits of its being set to correspond with a definite measurement and remain so without adjustment until that particular measurement is no longer required. Compasses are also used for striking-out circular figures.

**Calipers** are termed "inside" and "outside" calipers according to the character of the dimensions taken by their aid. Inside calipers are made with straight legs which are bent around only at the point and are used for measuring internal diameters. Outside calipers are made with bowed legs and are used for taking measurements of external diameters. "Combination" calipers are an improved form in which the legs are pivoted near the middle point, thus making four movable ends, two of which are bowed and are used for taking outside measurements, and the other two straight and applicable to the taking of inside measurements.

**Clamps.**—These are appliances in the form of beam-compasses in which the heads slide along a straight bar to which they may be tightened by set-screws. The heads are made either of brass or of hard wood, the former being red and the latter inserted into the bodies. They are employed for the purpose of taking measurements and for striking areas which exceed the capacity of the ordinary compasses.

**Caliper-rules and Caliper-squares.**—The caliper-rule consists of a short steel rule, a portion of which is attached to a closely-fitting slide which may be drawn out until the object to be measured is embraced between the opposing portions of the rule. As both the rule and the slide are graduated into minute fractions of an inch, the thicknesses of the objects measured can be read off directly from the dimensions on the slide. The caliper-square is a square, one edge of which is fitted with a caliper-rule.

**Bell Centre-punch.** This is a useful little device, by the aid of which a square, round, oval or triangular article may be instantaneously and accurately centred for the purposes of drilling and turning. It consists of a punch which is enclosed within a tube; the lower end of which is expanded or tapering into the shape of a bell. This tapering mouth adapts bars of different diameters, and when over the end of a bar of any cross-section ever ensures the marking of the exact length of the bar by the point of the punch.

The holding tools are represented by various forms of pincers, vises and clamps. Pincers.—These consist of various implements shaped somewhat like tongs with a long handle to which are riveted two jaws, one of which is immovable and the other movable. Pincers are used for holding work when the need of gripping is rare. Vises.—These are made in a great variety of forms and sizes, the most useful are those with parallel movement in which the vise-jaws are adjustable. The ordinary vise consists of a pair of jaws one of which is capable of being moved by a screw or by a lever, while the fixed rigidly. The improved form is provided with swivel-laws and swivel-arms, which move the vise-arms to any position that may be required. Vises are usually steel-faced, and the preliminary tightening them to a vise they are first secured by the wrought-iron backing and serrated for the purpose. The vises are usually welded to the backing which is commonly known as the "taper." The loose jaw-piece rounded on the back and capable of movement in a corresponding hole is attached to the fixed jaw. The sliding movement by which the vise is adapted to different angles for holding the form of tapered work. Vise-clamps are simply angle strips of sheet copper, which are placed against the order to prevent the bruising of the metal work by the serrations on the faces.

**Clamps.**—These comprise several appliances for holding together pieces in position for nailing and screw tightening up the joints in glued wood to allow sufficient time for the glue to set. An ordinary form consists of a lever and two brackets which slide together. The buckets are capable of being moved to any point on the bar while the operation of turning the screws is provided with a series of holes in the sliding bracket may be held in the desired point. Some of the types are the adjustable "screw-clamp," the latter being a very useful for securely gripping two sides of a frame while they are being nailed together.

The rasping tools comprise the rasps, files and rasps.

The Saws are an important...
TOOLS

...neyed for cutting and dividing substances. meral, the saw may be defined as a tool g a serrated blade and furnished with idly from the point to the tooth. "Gauge," for this purpose is a useful device for d h" or "rake," the inclination or angle of ace of a tooth. This varies from 65 de to 70 degrees for cutting soft woods and 80 degrees to 85 degrees for cutting hard s or the set of the teeth is formed by the base and top of the tooth from 45 degrees to 50 degrees for soft s and from 65 degrees to 70 degrees for woods. "Gullet" or "throat," the depth of both from the point to the root. "Gauge," hight of the saw. A gauge may be obtained by the wire-gauge. "Set," the amount of t inclination given to the teeth to one side other of the blade for effecting clearance of the sawdust. "Points," the er of teeth points to an inch, taken as a in estimating the coarseness or fineness of t. The teeth of cross-cut saws are usually ed to cut both ways. Saw teeth are design by various names such as "peg" teeth, teeth, "half-moon" teeth, "gullet" teeth, according to their peculiar form. The us kinds of saws commonly used by wood-e are the "hand-saws," the "back-saws," "frame-saws" and the "pad-saws." The "deal," "frame," "band" and "circular" are mostly used in connection with the action of lumber and sawmill-work. See ; AND SAWING in this Encyclopedia.

Files and Rasps.—These comprise a class ols having surfaces covered with sharp f burrows or teeth, which are employed for ing particles of wood, metal or other ma by the process of abrasion or the cutting of a multitude of fine points. They are in a vast number of shapes and sizes and i degrees of fineness or coarseness to them to various kinds of work and tials. A file differs from a rasp in that its ws or teeth are made by straight cuts in l on its surface by a reciprocating chisel e the metal is hardened, either in a series nge cuts or crossed cuts, while the teeth rash are a number of isolated projections on its surface by the pyramidal end of sangular punch. See FILES AND FILE MAK this Encyclopedia.

Age Tools comprise the various forms of s and gouges, the planes and a miscel- us assortment of spokeshaves or smooth-soles and various appliances such as grind s, emery wheels and oilstones, used for aiming a sharp cutting-edge on the various s and Gouges.—The essential principle these types of cutting tools is that of wedge. The chisel in its simplest form ically constitutes the slice of an axe, but as its action or movement is the result of the force applied to it by the blows of a mallet or hammer, the eye of the axe is replaced by a suitable device for driving the blow and the element of thrust enters into the operation of a chisel, as in the cases where it is used by the simple pressure of the hand, its action passes into that of the plane iron. Chisels are specifically defined as "chipping," "cross-cut," "firmers," "pairing" and "mortise" chisels. The firmer chisels are the ordinary short chisels used by wood-workers and are so designated in order to distinguish them from the paring chisels which are usually about twice the length of the firmer tools and are almost exclusively used by patternmakers. Paring chisels are seldom driven with the mallet, but are actuated by hand pressure alone. They are made in width ranging from one-fourth inch to two inches. The mortise or the chisel which is driven with a mallet and used for cutting mortises where percussion and leverage are rendered necessary. The gouges are forms of paring and firmer chisels which have curved cross-sections. The cutting-edge of the paring gouge is formed by grinding its inner face and that of the firmer gouge by grinding its outer face. Gouges vary in width from one-eighth inch to two inches. The paring gouge differs from the ordinary firmer gouge in its increased length. It is never driven with the mallet, but is applied with a thrusting motion of the hand and is used chiefly by patternmakers for cutting the various curved outlines of their work. It will be observed, that as a rule, the chisel cannot be satisfactorily used over a surface wider than itself, and, therefore, the gouge was devised in order to obtain a tool of greater utility for that purpose. In practice this advantage is partially realized, but there still remains quite a tendency on the part of the gouge to follow the grain of the wood instead of cutting through the fibres at a very slight inclination. All gouges are held and used in the same way as a paring chisel, but if any occasion demands the driving of a gouge with a mallet, it should always be held in a perpendicular position.

Spokeshaves or Drawing Knives are essentially two-handed blades which can only be used by being pulled toward the operator. The general form consists of a long, narrow, chisel-edged blade the ends of which are attached to two handles which stand at right angles to the blade. These handles are of wood and the "tangs" into which the ends of the blade are prolonged are bent around at right angles to the blade and pass right through the handles and are riveted over brass plates at their ends, in order to prevent the blade from being drawn out of the handles when it is drawn toward the workman against the resistance of the wood. These tools are used for cutting thick and heavy chips off the rough edges of boards so as to decrease the amount of the work required in the planing operations and they are also used by patternmakers for the cutting of sweeping curves or "sweeps" in work where great accuracy is not essential. Router planes are provided with cutters of varying forms and are effectively used for chamfering, rabbeting and other similar purposes.

Planes.—In its simplest form the plane con-
TOOLS

consists of a chisel-shaped plane-iron, so-called, though made of steel, placed at an angle in a "stock" or box of wood or metal in such a way that the cutting edge projects slightly through the bottom of the box. It derives its value from the guidance imparted to the cutting edge and the support of some part of the box. The plane is operated by being pushed forward, over the surface of the material being worked, so that the cutting edge bites into the fibre and removes a thin shaving which slides upward along the upper side of the plane-iron and is thus discharged from the hollow of the box. The depth of the cut or the thickness of the shaving removed may be regulated by raising or lowering the plane-iron, which is usually held in place by means of a wedge or by a screw, and is, therefore, capable of being adjusted. The plane-irons are made both single and double. In the latter case, the back-iron is introduced for the purpose of breaking the shaving so as to reduce the amount of cumulus. The correct continuity of the surface of the fibre of a long shaving. Planes in which double plane-irons are used are called "built-up" planes. There are at least a hundred different kinds of planes in use at the present time, but all of them may be grouped into three general classes—the "jack-planes," the "trying-planes," and the "smoothing-planes." The jack-plane is the first plane used for roughing down the timber received from the hands of the sawyer or from the saw-mill. The cutting-edge of its plane-iron is more curved than that of the other planes and consequently takes coarser and narrower shavings. The trying-plane is used after the jack-plane for producing the greatest accuracy attainable in the surfaces of wood by hand. It is usually about 22 inches in length and carries a plane-iron about two and one-half inches in width. The cutting-edge is sharpened perfectly straight transversely, and this, combined with the length of the plane, enables the workman to produce very true surfaces by its use. The smoothing-plane is a small plane used for imparting a smooth finish to surfaces in work where extreme accuracy is not essential. It is made about eight inches in length and is designed to carry plane-irons ranging from four inches to one inch in width, and about four inches in width. Some of the more useful and important special forms of planes are the "rabbet," or "rabbeting," plane, employed for making window frames and other similar work in which a rabbet or recess is required to be cut for the reception of the edges of a glass plate or other material; the "plow," employed for cutting a deep groove along the edge of a board for the reception of a corresponding tongue formed along the edge of an adjoining board, and the "stop-chamfer," plane, employed for cutting any chamfer or bevel-edge ranging from one-eighth inch to one and one-half inches in size, with a constant angle. Grindstones, Emery Wheels and Oilstones. The sharpening of the cutting-edges of chisels and plane-irons is performed first on a grindstone or on an emery wheel and then finished to a fine edge on an oilstone. Grindstones are shaped so that when turned into circular form and are made of varying diameters. They are usually arranged to revolve in troughs containing water, but they ought not run actually in the water as that would soften them and cause them to wear equally. The water should be fed onto a drip-can. They are revolved by a handle attached to the axe and make about 20 revolutions per minute. Oilerstones are used for ordinary tools. Various forms of rests and supports have been devised for holding during the process of grinding, but in the use of woodworking tools they are seldom the workmen usually preferring to hold tools by hand against the edge of the stone. Grindstones are "trued" or "turned" by hand by means of a pointed bar of which is constantly rotated during the operation so as to always present a new cutting edge to the stone and they are "trued" most by means of a threaded roller of steel is clamped in a frame and allowed to revolve against the surface of the stone. Such planes are called "grindstone truers." A number of wheels are sometimes used where the full edge of the grindstone is too coarse, but made of powdered emery cemented together or of emery cemented to a wooden centrepiece. The cementing material usually employed is a silicate insoluble in water and the wheels are usually made in about 10 inches in diameter than grindstones and operate at a higher rate of speed. Emery itself is a mixture of corundum composed of oxide of alumina, silica and a small proportion of potash. The oilstones, sometimes called "hones," are essentially fine-grained natural stones which are used for producing the final edge on tools by the process of abrasion, with a steady water to assist the process. They are usually set in wooden stocks and provided with covers to protect them from dust and wear. The principal varieties are the Turkey, Charnley Field, the Arkansas, the Granite and the Wadhurst stones. As a general rule oilstones will wear away the most in the middle and become hollow both in the diameter and breadth. Sometimes, as the case of the sharpening of jack-plane in this hollowing out is somewhat of an advantage, and is imparted a desirable curvature to the edge, but when it is required to have the surface of the stone is very easily rubbed o a flat sandstone or on a slab. Gouges and head-planes are used sharpened by means of oil-slips on slips of oilstone about six inches long and inches broad and ranging from one to one-half inch in thickness, the edges are rounded in a transverse direction on the hollow faces of the tools. Boring tools for wood comprise the forms of awls, gimlets, augers, bits and the drills. Awls or bradaws are the simplest form of boring tools and are used for preparatory work for the admission of nails and screws. The ordinary form of awl consists of a rod one end of which is fastened to a handle and the other end double-hevelled sharp V-shaped edge by which the fibre of the wood may be compressed and parted so as to form a hole with a screwing chips. The greatest drawback in the ordinary form is the tendency of the steel rod to p
the handle when the tool is withdrawn from the hole it has made in the wood. This is especially the case when working in hard woods. In the superior forms this fault is remedied by the use of a hollow handle which contains a number of awls of different sizes, each of which may be fastened to the handle by means of a screw-nut.

Gimlets are of awl-form plus a screw. It consists of a small steel rod, one end of which is attached to a wooden handle which forms a T with the rod, and the other end is shaped into the form of a screw. This end consists of a point in the form of a taper screw and a spiral groove which extends partway of the stem or body as in the case of the "twist-gimlets," or the body may be hollowed out into a nearly semi-cylindrical shell as in the case of the "shell-gimlets." The commonest forms are called "spikes," while other forms are designated as "triple-twist" gimlets, "auger" gimlets, "patent-twist" gimlets and "brewers-twist" gimlets, according to the shape of the spiral body. A distinct movement of these tools are usually required by a wood-worker.

Augers are merely large gimlets. They are made in both the twisted and the shell forms and are operated by both hands by means of a wooden bar thrust through the eye at the handle end of the stem. Their sizes increase one-eighth-inch at a time from three-eighths-inch to two inches in diameter.

Bits and Braces.—The bits comprise the various forms of boring tools such as "centres," "shells," "gouges," "countersinks," etc. They are actuated by the "brace" or "stock." These tools were developed in order to overcome the faults inherent in all forms of awls, gimlets and augers, due to the interruption of the continuous rotation of those tools necessitated by the change of the position of the hands and by the limited amount of pressure applied to the tool. The stock or brace consists of a crank, one end of which is provided with a round head for receiving the pressure of the breast of the operator and the other end recessed for the reception of the bit. In the earlier forms the bit was secured in the receiving end of the brace by means of a thumb-screw which engaged a notch near the end of the bit seventh part way down of the compound tool. This defect has been remedied in the later forms by the use of various kinds of expanding devices or expanding-chucks which adapt themselves to all shapes and sizes of stems and hold the bits securely and truly in place. The centre-bit comprises the centre-point, nicker and cutter attached to a shank. The nicker and the cutter are actuated by the brace and rotate about the centre-point. It is used for boring large and deep holes. The countersinks are made in a great variety of forms and are designated as "snail-horn," "rose-head" and "flat-head" according to the shape of the cutting point. In wood work they are employed for enlarging the entrances of holes or to dress the heads of screws or bolts lie close enough to the surface of the wood. Some of the other useful forms of bits actuated by the brace are the "screw-driver" bit, the shank end of which is square-tapered to fit the socket of the brace and which being turned with the brace is quicker in its action than that of a hand-worked screw-driver; the "taper" bit for boring funnel-shaped holes; the "shell" bit, the cross section of which is composed of a convex and concave curve roughly semi-circular in form; the "nose" bit, a shell bit provided with a nose or lip at the cutting-point for the withdrawal of the core from the wood; the "spoon" bit, the cutting-edge of which is formed in the shape of a parabola and, therefore, does not draw out the core as effectually as the nose bit; and the "gouge" bit, the cross-section of which is similar to that of the gouge used is simply rounded at the cutting-point without the provision of a nose or lip. In the ordinary forms of the compound tool the brace is rotated through complete revolutions, thus preventing the boring of holes or the driving of screws in one side of a corner at a distance any closer to the adjacent side than that which is equal to the radius of revolution, but this shortcoming of the tool is remedied in the hatchet brace in which the brace acts as a lever which keeps the amount of the same time feeds it forward by means of a ratchet and click actuating a square-threaded feed-screw, as the brace is moved back and forth through partial revolutions.

The striking tools comprise the various forms of hammers and mallets.

Hammers.—Ordinarily, a hammer consists of two parts—the iron or steel hammer-head, and the shaft or handle of wood which is driven into a hole in the centre of mass of the hammer-head. The angles at which the handles are attached to the heads vary greatly on account of the variations in the position of the centre of gravity of the head relatively to the line of the penetration of the handle, and also on account of the various convexities of the faces of the hammer-head. The form of the "pane" or the narrower or smaller end of the hammer-head also varies greatly in the hammers used for different purposes. When of hemispherical form as in the engineers' hammers, it is called a "ball" pane; when it is made in the form of a narrow, round-edged ridge placed at right angles to the axis of the handle it is called a "cross" pane; and when the ridge runs longitudinally it is called a "straight" pane. In the claw-hammers the appreciable part of the handle toward the handle and is divided by a V-shaped groove, and the head is usually attached to the handle by means of side flanges. It is very useful for drawing nails. The hand hammers used by wood-workers range in weight from one-half ounce to 10 pounds. The weight of the head and the balance of the head in the handle are the most important considerations determining the suitability of a particular hammer, for if the handle is too light for the head will break off.

Mallets.—These are forms of hammers in which the metal heads are replaced by wooden blocks. They are practically heavy wooden hammers which are used for delivering blows on the handles of chisels and gouges in order to avoid the risk of the latter being split by the blows. The ram of iron hammers are used for that purpose. Round-faced wooden mallets are used by molders for rapping patterns in order to detach the sand which adheres to them when they are drawn.
from the molds. Woodworkers' mallets are either square or round in form. The square mallets are about six inches in length and two by wood-workers range in weight from one-half inches in width. The round mallets are about five inches in length and three inches in diameter. The mallet-heads are usually made of hickory wood, and sometimes of lignum vitæ.

The chopping tools are the axes, the hatchets, and the adzes. In each case they represent the combination of a striking tool and a cutting tool. In these tools the shape of the hand or helve and the manner in which it is attached to the blade is of the utmost importance in governing their effectiveness.

Axes and Hatchets are edged tools with handles used in chopping for rough cutting or splitting. They vary mainly as to the weight of the blade, to the shape or curvature of the handle and to the form of the cutting-edge. Axe blades range in weight from two to seven pounds. These blades are usually made by welding the hard tempered steel portion which forms the cutting-edge to the iron portion which contains the "eye" provided for the reception of the handle. The curved form of the handle tends to counteract the influence of the force of gravity which tends to twist the blade downwards when the axe is used for chopping at various obliquities. The form of the cutting-edge, curved horizontally, and wedge-shaped transversely to the sides of the blade, is designed for the purpose of separating the groups of wood fibres successively, and for equalizing the pressure of the blow on each side of the blade. A hatchet is a light form of axe, with usually a nail-pulling groove back of the blade.

In the adze, the cutting edge stands transversely or at right angles to the handle, which is quite short. The entire outer face of the blade is made slightly curved, and its cutting-edge is formed by beveling from the inner face. It is usually employed for the forming of lengths of wood into curved shapes.

**Metal-Working Tools.**

The almost innumerable variety of metal-working tools and the great variety of purposes for which they are employed make the classification into a series of general groups practically impossible within a limited space. In a general work they may be conveniently divided into various classes according to the character of the work to which they are applied. Such a method of classification would group the main body of metal-working tools under foundry work, forge shop work and machine shop work, the last named including all the turning, gear-cutting and tool-making tools and appliances. The greater number of these are treated under their special headings in the several volumes of this Encyclopedia, and as in the case of the wood-working appliances, the various kinds of machines employed in the metal-working industries are not specific treated but included in the major headings under the title METAL-WORKING MACHINERY. The larger metal-working tools are known as machine-tools, including all those machines that operate cutting tools for shaping metal, such as lathes, power-drills, boring-drills, shapers, milling machines and the like.

The elementary descriptions of the various forms of small tools such as the guiding tools, the holding tools, the rasping tools, the cutting tools, the drilling tools and the striking tools already given in connection with the wood-working tools will be found applicable to similar tools employed in metal working, subject, however, to the modifications demanded by the greater hardness of the material worked, and the greater accuracy of execution required in the finished products of some classes of metal work. In the main these modifications consist in the employment of finer and harder materials in the making of the tools, in the particular forms given to the cutting edges and in the methods by which the tools are applied in the execution of the work.

The guiding tools employed in metal work are quite similar to those already described and comprise the various forms of rules, squares, straight-edges and calipers, all made of metal, and also the various forms of micrometer calipers which is employed for making adjustments for wear. For this purpose, the nut is closed onto the screw by being advanced on the stem toward the yoke. The shell or thimble on which the graduations are marked is attached to the end of the screw and rotates with it, and moves along over the shank of the yoke. A screwing arrangement for rapidly advancing the screw is provided in the form of a knurled-nut in the yoke which is also capable of contracting a bushing over the measuring stem so as to lock it in any desired position. The measuring point and the opposing anvil are carefully ground so as to make their faces perfectly parallel with each other. These micrometers are usually provided with a screw having 40 threads to the inch and with the barrel graduated to 10ths and 40ths of an inch. By this arrangement one revolution of the screw advances the thimble one division on the barrel, equal to one-fortieth of an inch, and as the circumference of the thimble is divided into 25 equal parts, twenty-fifth of one revolution of the screw advances the measuring point one-twenty-fifth of one-fortieth, equal to one one-thousandth of an inch. By the aid of the vernier attachment applied to the barrel measurements as small as one ten-thousandth of an inch are readily obtained.

**Gauges and Indicators.**—These tools are employed for indicating the sizes of wire, machine-screws, drills and plate thicknesses. Various systems of gauges are employed, in all of which the dimensions are purely arbitrary. The American or Brown and Sharp gauge was adopted to produce a gauge to overcome the irregularities in spacing of the Birmingham gauge. In this gauge the dimensions increase by regular geometrical progression, the largest dimension No. 0 being equal to 0.46 inch and the next smaller dimension, No. 000, being obtained by multiplying 0.46 by the constant 0.90522, each smaller number being the product of the preceding number and the constant. Gauges for indicating the gauge of wire or plates are of two forms — the angular and the
notch gauges. Other forms of gauges are the "centre" gauge which is used for gauging lathe and machine centres in turning and grinding work; the "screw-thread" gauge used for gauging the threads; the "screw-pitch" gauge used for determining the pitch of screw threads; the "depth-gauge" used for measuring the depth of holes and recesses; the "scratch" gauge used for ruling lines parallel with the edge of a piece of work and several forms of "surface" gauges which are principally used in determining the parallelism of the surface of a piece of work with the machine table, housing or other plane of reference. They are also used in testing, erecting and in the setting-up work on machine tools.

Test indicators are a class of tools or instruments used for determining small irregularities in the accuracy of cylindrical surfaces and small variations from the true rotation of such surfaces. They are also used in determining the inaccuracies of a plane surface and in measuring small amounts of end or lateral motion such as the end-motion of a spindle. They are of two types—those which merely indicate the presence of looseness or those which give a reading or measurement showing the exact amount of the errors.

Some of the other small tools indispensable to the metal worker may be briefly summarized as follows:

The various forms of "hack-saws" used for severing purposes. They are made of hardened steel to cut metal and mounted in a light frame and may be operated either by hand or by some form of power. Their blades are usually made with 14 teeth to the inch for general work and with 25 teeth to the inch for cutting tubing and thin metal.

The "monkey-wrench" and other forms of wrenches used for screwing and unscrewing the nuts of screw-bolts, etc.

The various forms of "drills" and especially the modern "twist-drill" which is universally used at the present time and which has completely supplanted the old flat forged drill which for many years held the first position as a tool for producing circular holes in metal. "Drills" which comprise a class of fluted tools used for finishing and truing bored or drilled holes. They are solid when used in a socket or with a wrench and shell or hollow when bored out to fit a mandrel.

The "screw-threads," "taps" and "dies," which, according to their use, may be divided into two classes—those used for fastenings and those used for communicating motion. There are three forms of screw threads used for fastenings—the "V" thread in which the sides make an angle of 60 degrees with each other and in which the top and the root are sharp; the "United States standard" thread which is similar to the "V" thread with the exception that the top is cut off and the bottom filled in; and the "Whitworth" or "English standard" thread in which the top is rounded off and the root filled in and in which the sides form an angle of 55 degrees with each other. There are also three forms of screw-threads employed for communicating motion—the "square" thread, the "trapezoidal" thread and "Powell's" thread.

The top is used for producing internal threads and the die is employed for cutting external threads. They are of two kinds—those operated by hand and those operated by power-driven machines. Hand taps and dies are in sets, each of which comprise three taps—the "taper-tap," the "plug-tap" and the "bottoming tap." The taper-tap is parallel on the point for a distance equal to one-fourth the diameter of the tap and this point is made the diameter of the roots of the teeth and corresponds to the correct size of the hole to be tapped so as to produce a full thread. In the plug-tap the first three teeth are tapered off and in the bottoming-tap the teeth extend full to the point. The taper-tap is used for starting a thread, the plug-tap for extending it nearly to the bottom and the bottoming-tap for finishing the full thread to the very bottom of the hole.

The dies may be divided into two general classes—those which have to be passed over the work several times in order to produce a finished thread and those by which a finished thread is produced at a single cutting. In the former, the cutting-dies are held in a stock and are capable of being opened so as to permit of their being passed over the work and then closed, by means of a set screw, an amount sufficient to enable them to cut a full thread. In the latter, they are not of the screw-plate type, the "chasers" or "feathers" are held radially in a cast-iron "collet" surrounded by a wrought-iron ring. These dies are capable of being adjusted to compensate for wear. The bevelled outer ends of the chasers fit into corresponding bevelled grooves in the wrought-iron ring so that when the ring is forced down the chasers are moved toward the centre. A great variety of self-opening and adjustable dies are also used for machine threading.

MASONRY WORK TOOLS.

The masonry work tools may be conveniently divided into two general classes—stonemasons' tools and bricklayers' tools. Those employed by either of the two classes of workmen are neither numerous nor intricate in design. The principal tools of the stonemason are the saw, the mallet, the scrabbling hammer and the various forms of chisels designated as the "inch-tool," the "boaster" and the "broad-tool," which are distinguished by their size, the first being one inch, the second two inches and the third three and one-half inches in width.

In the work of stone cutting, the preliminary operations are performed by a small chisel called the "point" and the finishing work executed by the use of the others in turn according to their size. The principal tools of the bricklayer are the various forms of trowels, the plumb levels and the bricklayers' hammers. For further information relative to the various forms of stone-cutting saws, see SAWs AND SAWING; STONE-CUTTING AND DRESSING; and also the articles under the titles Files and File Making; Metal-Working Machinery; and Wood-Working Machinery in this Encyclopedia.

TOOMBS, Robert, American lawyer and statesman: b. Wilkes County, Ga., 2 July 1810; d. Washington, Ga., 15 Dec. 1885. He was the son of a Georgia planter, attended for one year Franklin College (now the University of
TOON — TOOTH-ORNAMENT

(Georgia) and was graduated at Union College, Schenectady, N. Y., in 1828. In 1829 he studied law at the University of Virginia and in 1830, being under age, was admitted to the bar by special act of the legislature. Within 10 years he became one of the foremost lawyers of Georgia. In 1836, when the Creek War broke out in Alabama, he raised a company of volunteers and served as captain under Gen. Winfield Scott. In 1837-40 and 1842-43 Toombs was a member of the legislature and during this time became a leader of the State Rights Whigs of Georgia. From 1844 to 1852 he served as representative in Congress and was one of its best orators and debaters. In 1850 he was a prominent supporter of the compromise measures in the House. In 1852 with other Southern Whigs he refused to support Scott for President. After 1852, like Stephens, he acted with the Democrats. From 1853 to 1861 he was in the United States Senate. In 1854 he favored the Kansas-Nebraska Bill as carrying out the principles of the compromise of 1850. Immediately before the election of 1860 Toombs lectured in the North on slavery. After the election of Lincoln he advised secession of the Southern States and made secession speeches in Georgia in December 1860 and in the United States Senate in January 1861, maintaining that in secession lay the only hope of security for the South. Georgia seceded 19 Jan. 1861 and Toombs withdrew from the Senate four days later. In March he was formally expelled. He was chosen to the Confederate Provisional Congress that met in Montgomery in March 1861 and by a considerable minority was considered as a candidate for President. On 21 February he was made Secretary of State by President Davis. He opposed the firing on Sumter that began the contest of arms. Resigning September 1861 to become a brigadier-general in the Confederate army, he fought with distinction in the second battle of Manassas (Bull Run) and at Sharp'sburg (Antietam). He resigned his commission in 1863 and in 1864 was made a major-general of the Georgia militia. He disapproved the policy of the Richmond administration and personally disliked Davis. With Vice-President Stephens and Governor Brown he headed the Peace Movement in Georgia in 1864, sending a message to the people of the South on the cause of the Confederacy. In 1865, to escape arrest, Toombs went abroad, visiting Cuba, France and England. Returning in 1867, on the restoration of the privilege of habeas corpus, he soon amassed a fortune of $500,000 in the practice of law. In 1872 he was a member of the Georgia Democratic Convention and supported Horace Greeley for the Presidency. In 1874 the Georgia legislature passed a law providing that railroads should be taxed like other property. The railroads resisted, and Toombs, taking the case of the State, won the suit in the courts and collected all back taxes. For 10 years he continued the struggle to force the railroads to pay taxes and give proper service to the public and in 1877 secured the passage of a law providing that railroads in the Southern States have since passed the model after the Georgia law.

In the eyes of Toombs he was considered examples and reared a four children. His friends thought him a statesman of the first order and were disappointed that he made no higher mark. His handy temper hindered his career in politics. In the army he was an able general, but not a disciplined subordinate. He belonged to the school of Jefferson in politics, believing in strict construction, State sovereignty and strong local government, with much liberty for the individual. His political theories were meant for times of peace, but he could not stand the strain of war; consequently he was at variance with the Confederate administration from the beginning. As long as he lived Toombs never ceased to denounce the Reconstruction measures of Congress. His experiences from 1863 to the end of Reconstruction caused him so to dislike the United States government that he refused to ask for a pardon or to take the oath of allegiance and he never again had the privileges of citizenship. Consult Stovall, 'Robert Toombs, Statesman, Speaker, Soldier, Sage' (1892); Trent, 'Southern Statesmen of the Old Regime' (1897).

West Virginia University.

TOON, or TOONA, a tree (Cedrela toona) of the family Meliaceae. It is a native of India and Australia, being found at altitudes of 400 feet on the Himalaya Mountains as well as near tide-level. In the former country it is one of the largest trees; in the latter, it often exceeds 150 feet in height and 18 feet in circumference. Hooker mentions a specimen of India 10 feet in diameter at five feet from the ground. The tree is cultivated for its timber and flowers. The wood is soft, open-grained, easily seasoned and worked, little liable to warp and easily polished. The heartwood is reddish and resembles mahogany and veneers taken from the roots or where branches join the trunk are said to be remarkably handsome. The chief uses of the wood are in house-building, furniture-making, carving, etc. Under the names bastard cedar, bastard white cedar and Moulmein cedar the wood is an important export to English markets. The bark is very astringent and is used for leather which usually is pulpish from a dye also present. The flowers yield a reddish yellowish dye which is in common use in India. A close relative of this tree, C. serrata, is grown in the United States as a tree, where its leaves and berries are cultivated in California and the Gulf States. It is not hardy in the colder parts of the country. See Mahogany.

TOOTH-BILLED PIGEON, a large fruit-pigeon (Didunculus strigirostris) of Samoa, formerly called "Dodlet" under the erroneous impression that it was a surviving relative of the dodo. It is about 14 inches long; body rounded, head orange, with the lower mandible deeply cleft into three distinct tips near the tip. Head, neck, breast and abdomen glossy greenish black, rest of back black and under coverts deep chestnut. It is an native.

TOOTH-ORNAMENT, a decoration peculiar to medieval architecture, consisted of row of fluted flowers, the centres of which pre
ject in a point. These are used in series, either in a continuous row or at slight intervals, and are generally inseparable. They are used in great profusion in the Early English architecture, forming one of its characteristic features, and in some of the richer suits of molding the flowers are very thick and the series is repeated several times.

TOOTH-SHELL. See DENTALIUM.

TOOTHCHE, a pain in a tooth or adjacent gum or in a tooth causing the gum to be sore. The most common cause is decay of some portion of the tooth, admitting air to the nerve, which causes sharp pain. If there is a considerable opening it is colloquially called "jumping toothache." The pain may be stopped by application of oil of cloves on cotton and closing the passage that admits air; if oil of cloves is not to be had diluted chloroform on cotton is a good substitute; cresote is also used, especially in a gum styled toothache gum. But the pain and decay will usually continue unless the services of a dentist are sought. Decay in the root of a tooth often generates gas, which induces a pressure on the nerve, and consequent toothache. The remedy is to bore a small hole into the tooth and release the gas. If this is not done the gas forces itself through the gums, often with severe pain, resulting in a gum-boil. This is not a true boil, but a hole formed through the flesh by the pressure of the gas. When this finds a vent there is some relief, but a permanent cure involves treating the tooth by a dentist. Neuralgic toothache is a purely nervous variety, and may occur either in sound or carious teeth. It comes and goes suddenly in paroxysms, and is accompanied by little or no swelling. As a preventive against toothache the teeth should be kept scrupulously clean, and when they show symptoms of decay the services of a skilful dentist should be secured. The decay of a tooth is arrested by stopping up the cavity.

TOOTHACHE TREE. See ARALIA.

TOOTHED HERRING. See MOONEYE.

TOOTHPICK, a small pick for removing substances lodged in the teeth. The ordinary toothpick is of wood about the size of a friction match, but longer and slenderer and pointed at one end or both. The use of wooden toothpicks has become very common in the United States and many millions of the tiny wooden slivers are manufactured there every year. The seat of this industry is in Maine, near the forests of white birch, which wood is chiefly employed in their making. The telling of "toothpick trees" is not a separate business but one incidental to the Maine lumbermen. After a tree has been felled the branches are lopped off and only the trunk is sent to the mills. There the bark is skimmed and the naked trunk inserted in a hold or molting box of the thickness of toothpicks and as wide as a toothpick's length. These sheets, known as "veneers," are run through another machine which in one operation cuts them into toothpicks ready for shipment. Of the better grades white by quality, or "tears," are separated. Toothpicks are made every year from Japan and from Portugal. The Portuguese toothpicks are made of orange-wood and are smaller but tougher, better shaped and more finely pointed than the domestic picks.

The Japanese make their toothpicks from fine reeds, which they shave down to the thickness of paper, retain their form and pliability. Metal toothpicks, as of gold, which were formerly common, are now little in demand since their use endangers the enamel of the teeth. Quill toothpicks, cut from the shaft of a hen's feather, are still considerably used.

TOOTHWORT. See DENTARIA.

TOOWOOMBA, too-woom'ba, Australia, a town of Queensland, in the center of the state, 100 miles by rail west of Brisbane, on an elevation known as the Great Dividing Range. It has a number of churches, two colleges and other educational institutions, and a fine new municipal building. There are flour-mills, saw-mills and a brewery, and in the neighborhood are vineyards. Pop. about 11,000.

TOP-MINNOWS, a group of small, robust minnows, represented by Gambusia patruels of the brackish waters along the Atlantic Coast, which are distinguished by their habit of swimming and feeding near the surface. See MINNOW.

TOP-SHELLS, the Turbinidae, a family of gastropod mollusks, mostly tropical and oriental, in which the shell is usually turbinate or top-shaped, but may be pyramidal. It is generally nacreous internally. The operculum is horny, and may exhibit a spiral form. In the genus Turbo the shell is top-shaped with a rounded base. The whorls are convex, and the aperture is large, the operculum being calcareous. The genus Trochus also belongs to the top-shells. In the latter genus the shell is pyramidal and the base flattened, the operculum being horny. The common top is the T. echinatus. Others are the T. versicolor, the T. imperialis and the T. miloticus. After having been ground and powdered to exhibit the nacreous inner layers, they are extensively sold as ornaments.

TOPAZ, a mineral having the composition of an aluminum fluo-silicate. It is not the topaz of Pliny and other early writers which was chrysoleite (q.v.), the names having been interchanged. It generally crystallizes in orthorhombic prisms, colorless, white, yellow, or occasionally pale green or blue. Transparent topaz, in any of its tints, is a beautiful gem. The colorless variety much resembles diamond, and is sometimes sold for it, though its lower hardness (8) affords an easy test. What has been called the largest diamond in the world, among the Crown jewels of Portugal, is probably a colorless or "white" topaz. The yellow variety is most familiar, and is called "Brazilian topaz," in distinction from "Oriental topaz" (yellow sapphire) and "false," "Scotch" or "Spanish topaz" (yellow quartz). The "Oriental topaz" is much rarer, harder (9) and denser (about 4); while the "Spanish topaz" is cheaper, less hard (7) and lighter (2·65), the density of topaz being 3·4 to 3·6. It is also distinguished by its eminent basal cleavage. The favorite shade is wine-yellow or sherry-color. Both yellow and blue topaz fade and become white by weathering, or exposure to light, and some yellow varieties can be changed to a pale pink by heating, yielding the so-called "burnt topaz" or "Brazilian ruby," resembling the pale, or Balas, variety of ruby spinel (q.v.).
Topaz occurs usually in metamorphic rocks, like gneiss, but also somewhat in igneous rocks. Tonality, and topaz, are not always associated with tin-ore. The principal localities are in Ceylon, Siberia, Japan, Brazil and Mexico. In the United States it occurs in large masses at Stoneham, Me., and Trumbull, Conn.; in crystals in Colorado and Utah. Fine topaz crystals, colorless and pale blue, have recently been found in San Diego County, Cal.

**TOPAZOLITE**, a variety of andradite garnet having a light yellow or pale grayish green color. The most beautiful specimens are found in the Alava Valley, Piedmont, Italy. They also occur in California.

**TOPEA**, a Buddhist monument intended for the preservation of relics. The oldest monuments of this kind are spherical or elliptical cupolas, resting on a circular or rectilinear base, with an umbrella-shaped roof, and sometimes with a series of roofs of this form which develop into a spire, pyramid, or other architectural form. In the interior is a cell or chamber for containing the box with relics; but in some cases no relics have been found, and it is supposed they have been buried underground. The Sanskrit name is **stupa**, mound, from which is derived thupa and tope, meaning top. The older topeas are masonry mounds, the cupola top and ornamental roofs and spire forms being later developments for ornamentation. Some of them are of great architectural beauty, rising tier above tier, with a series of graceful "parasol" roofs, the limit of height being about 300 feet. But the typical construction is that of The Great Tope at Sanchi, in central India. This is a hat-shaped mound or dome 42 feet high and 106 feet at the widest point. The flat space on top was for the chhatra or umbrella-like apex. This being the royal emblem. This was like a substantial parasol, as if to guard the relics from the weather. The Great Tope is surrounded with a magnificently carved stone railing, leaving an empty ornamental entrance or gateway, over 30 feet high. The chamber or cell in which the relics were kept was generally built with an outer construction of masonry; often enclosing a bronze bell which again encased Christ's Body. It stood as a case and within this perhaps a casket of gold containing the relics which it was desired to preserve. The number of stones in the topeas often indicate Buddhist symbolism—three, seven and 11 being the numbers rich in meaning. Topeas are common in the Orient and there are groups of conspicuous ones at Amravati, Sarnatti and Telalad in Bengal, at Sattahara and Somari in central India, at Abayagiri, Ruanwalli and Tampamaya in Ceylon. Relics of kings and great men were thus cared for, much as we build statues and monuments today. See DAGOBA; PAGODA.

**TOPEKA**, Kan., city and county-seat of Shawnee County, capital of the State and the third largest city in the State, on both banks of the Kansas River, on the Atchison, Topeka and Santa Fe Railway, 90 miles west of Chicago, 300 miles west of New York, 900 miles west of Philadelphia, 1,300 miles west of Saint Louis, 1,400 miles west of Denver, 1,500 miles west of Salt Lake City, 1,600 miles west of Los Angeles, 1,700 miles west of San Francisco, 1,800 miles west of Portland, 1,900 miles west of Seattle, 1,800 miles west of San Diego, and 2,000 miles west of Los Angeles. It is on a branch of the Kansas River, which is dammed at Topeka to form Lake Shawnee. The city is laid out with broad streets crossing at right angles and beautifully shaded. Topeka was settled by people from the "Free State" in 1854; an anti-slave constitution was adopted here in 1856 known as the "Topeka Constitution" and the "Topeka government" was established by national authority. It was incorporated as a city in 1857 and selected as the State capital in 1861. The principal industries are the railroad shops of the Atchison, Topeka and Santa Fe Railway, printing plants, six flouring mills having a capacity of 5,000 barrels per day, creameries, packing-houses, foundries, machine shops, boiler works, preserving works, silo factories, engine works and planing mills. According to the United States census of manufactures of 1914 Topeka had 159 manufacturing establishments with a combined capital of $14,186,000, employing 5,721 persons, paying $3,691,000 in wages and manufacturing a product valued at $20,000,000. Topeka has 10 banks, three of which are national banks and three building and loan associations with assets of $9,000,000. Topeka is an important jobbing centre, there being four wholesale groceries, six wholesale commission houses, wholesale hardware, paper, drugs, groceries, and an orphans' home and chief railroad centres between the Missouri River and the Pacific Coast. The State capital, a handsome stone edifice, is the most important building of the city. The State Memorial building, erected to the memory of the veterans of the Civil War at a cost of $350,000, is the most handsome structure in the city. The government building and the court house are also creditable buildings. Topeka has a municipally owned city building with a handsomestorium annex with seating capacity for 5,000 people. Just west of the city, two miles, is the State Hospital for the Insane; the State Re form School is located just north of the city about three miles. The Colored Industrial Institute is a coeducational institution for colored boys and girls located just east of the city. Orphans Home—two Crittenden Homes, one each for the unfortunate white and colored girls, the Provident Association Building, the Inglewood Home for Old Ladies, a Methodist Home for the Aged are among the most notable of its charitable institutions. The Santa Fe Railroad maintains its own private hospital and the public hospitals are Saint Francis and Saint Luke's Hospitals. The city has a free public library, a well-organized public school system, including a high school established in 1874; an excellent manual training school is also maintained. It is the seat of Washburn College, a coeducational institution for men and women, and the College of the Sisters of Bethany and three business colleges. Topeka has the commission form of government, having a mayor and four commissioners; a well-equipped fire department and an excellent police department. The city owns its own electric light and water plant. The cost of city government as reported by the United States government reports for the year 1915 shows $20.71 per capita as spent in Topeka for the maintenance of city government. The physical valuation of Topeka is about $54,000,000. The area of the city is 16 square miles. Topeka has over two miles of ornamental lighting system, has 240 acres of city-owned parks and play grounds. Pop. 22,250.

**TOPELIUS, to-pé-le-oos, Zacharia, Finnish author:** b. Kuddnäs, near Nykarleby, 14 Jan.
TÖPFER — TORBERT

1818; d. Helsingfors, 13 March 1896. He was graduated at the University of Helsingfors in 1842, studied theology at Helsingfors and Uppsala, in which many of his earlier writings were first printed, and held at the university the chairs successively of Finnish history (1854–63), of the history of Finland and the monastic regions (1863–66), and of general history (1876–79). After Rupenberg (q.v.), he is the chief poet of Finland. His religious and patriotic lyrics are particularly valued. Among the collections of his verse are 'Flowers of the Heath' (1845–54); 'New Leaves' (1870). He wrote also several dramas, such as 'After Fifty Years' (1851), and works of fiction, including 'A Surgeon's Stories' (1853–67), a cycle based on Finnish and Swedish history from the time of Gustavus II Adolphus, to that of Gustavus III. There are German translations of several of his writings and an English version of the 'Surgeon's Stories' has appeared in the United States (1883–88).

TÖPFER, Rudolph, Swiss novelist: b. Geneva, 1799; d. there, 1846. In 1832 he became teacher of aesthetics at the Academy of Geneva and in 1839 his novel 'Le presbytère' attracted general attention to him and ensured his position in the world of letters. He was a voluminous writer and won renown for his 'Voyages en zigzag' (1848) which were continued with illustrations by himself in 1853. Among his best productions is 'Le Voyage en Zigzag' (1848), his little novel in pictures which were published together in Geneva, 1846–47. Consult Wolterstoff, Hermann, 'Essai sur la vie et les œuvres de Rodolph Töpfér' (Magdeburg 1894).

TOPHET, or TOPHETH, a locality described in Scripture as in the valley of Hinnom, near Jerusalem, where high places were erected, and which was the chief seat of the worship of Moloch, with its fiery human sacrifices and abominations. The good King Josiah suppressed that form of idolatry, and made Tophet a receptacle for the refuse of Jerusalem. Afterward it became a burying-ground. It was shunned with horror by the Jews, and the word has come to be used by Christians as the synonym of a place of punishment after death. The origin of the word is doubtful. It is derived by some from Hebrew toph, a drum, in allusion to the drums beaten to drown the cries of children burnt in the fire to Moloch, and this seems a probable interpretation. Another derivation is from an Aramean word signifying to spit or vomit, in allusion to the disgust created by the place. Consult 2 Kings xxiii, 10; Jer. vii, 31–32; Isa. xxx, 33.

TOPIC, the subject of a discourse, whether written or spoken; the matter treated of in conversation, argument, oration, literary composition, etc. In rhetoric and logic topic was restricted to the narrower sense of a common ground or point, from which other arguments may be started: one of the various general forms of argument employed in probable reasoning, as distinct from demonstrative reasoning. In medicine the word is usually more to denote any remedy locally applied; it is, however, frequently used in the plural, topics, denoting the class of such remedies, than applied to any one specific.

TOPLADY, Augustus Montague, English theologian and hymn writer: b. Farnham, Surrey, 4 Nov., 1760; d. London, 11 Aug., 1778. He was educated at Westminster and Trinity College, Dublin, and in 1768 was presented to the vicarage of Broadbent, Devonshire. Though a voluminous writer — and a strenuous defender of Calvinism against John Wesley — Toplady is now hardly known except as the author of the hymn 'Rock of Ages,' one of the finest expressions of evangelical faith and fervor to be found in all hymnology.

TOPOGRAPHICAL SURVEYING. See Surveying.

TOPOLOBAMPO BAY, Mexico, a small bay of the Gulf of California on the west coast of the state of Sinaloa. It is noted on account of the attempt made in 1886 by a number of Socialists of the United States to form a co-operative community on its shores. A company was chartered, in which all the colonists were stockholders, and which was to own all the land, and conduct all the business of the community. Everything was to be done as far as possible on the socialist plan as described in Bellamy's 'Looking Backward.' Several hundred colonists joined in the experiment, and a city was surveyed and laid out on an elaborate plan. The experiment, however, was a failure, largely owing to aridity of the land and the absence of available streams for irrigation. The place was abandoned in 1891.

TOPPHONE, an instrument for determining the direction from which any sound proceeds. It is valuable for use at sea, during fog, or in the night, to determine the direction of a sounding bell, fog-horn, whistle, etc. The topophone was invented by A. M. Mayer, and consists of a centrally pivoted horizontal bar having at each end resonators, with their openings facing the same way, each with a connecting sound tube for the ears of the observer. In use the bar is turned until a position is found in which the sound is loudest and equally distinct in each ear. The location of the sound is at a right angle to the bar in the direction to which the resonators face.

TORAH, or THORAH. See Pentateuch.

TORBANE, or THORBANITE, a lustreless variety of canal coal, especially rich in volatile matter formerly used in the manufacture of illuminating gas, paraffin and lubricating oils. It occurs at Torbane Hill, near Bathgate, Scotland, but the supply is exhausted. See Boghead Coal.

TORKEL, or TÖRFEND, Alfred Thomas Archimedean, American soldier: b. Georgetown, Del., 1 July 1833; d. at sea off the coast of Florida, 20 Sept. 1880. He was graduated at West Point in 1855, was engaged on frontier duty in Texas, Florida, New Mexico and Utah in 1855–60, and in 1861, and led his regiment in the Peninsula campaign of 1862; was assigned to the duty of mustering in volunteers. He was commissioned colonel in 1861, and led his regiment in the Bull Run and in the battles of
South Mountain and Antietam. He was promoted brigadier-general of volunteers in 1862; commanded a brigade at Gettysburg in 1863; for gallantry he was breveted major in the regular army; in April 1864 was transferred to the cavalry service and placed in command of the 1st division of the Army of the Potomac. He commanded the cavalry in many subsequent engagements, including those at Anse Hotten, Milford, Winchester and Waynesboro. In 1864 he was brevetted major-general of volunteers, attaining the same rank in 1865 in the regular army. In 1866 he was mustered out of the volunteer service and resigned his regular army commission. He was United States Minister to the Central American States 1869-71, was transferred as consul-general to Havana, Cuba, and in 1873-78 was consul-general in Paris. He was lost in the foundering of the Vesta off the coast of Florida.

TORCELLO, tor-chel’o, Italy, an island in the lagoon of Venice, six miles above the city. It is the see of a bishop and possesses an ancient Byzantine cathedral of Santa Maria of the 7th century, with mosaics of the 12th century, curious altar-benches, an antique crypt, octagonal baptistery from 1008 and a bellry; Santa Fosca is another handsome church with a fine interior (12th century). Pop. 130.

TORDENSJOLD, Peter, Norwegian naval officer; b. Trondhjem, 1691; d. 1720. He endeared himself to the people by his exploits in the navy to which he was appointed a lieutenent in 1716 was given a noble rank for his victories. But in 25 years of age he destroyed the Swedish fleet of 44 ships and compelled the raising of the siege of Fredriks- hald by Charles XII. He was made vice-admiral (1719) for the destruction of the principal Swedish squadron.

TORGAU, to’r-gow, Germany, a town in the province of Saxony, Prussia, on the Elbe, 32 miles northeast of Leipzig. Prior to 1889 it was a fortified town, and has considerable historical significance in connection with (1) the Alliance of Torgau, a confederation formed in 1526 by Saxony, Hess, and other German states in which Protestantism united for the purpose of defense against aggression on the part of their antagonists; (2) the Articles of Torgau, a declaration by Luther and his supporters in 1530, which was the foundation of the Augsburg Confession; (3) the battle of Torgau, fought in the suburb of Lautitz, 3 Nov. 1709, when the Prussians under Frederick the Great defeated the Austrians under General von Daun; (4) the siege of Torgau by Turenin in 1814, the city holding out for three months and surrendering 10 Jan. 1814. The Renaissance Harten- fels Castle of the 15th century was a former electoral residence. In the town-hall is a museum of Saxon antiquities. There is here a modern fort for the protection of the railway system. The royal stad from is long located in the vicinities. Pop. about 13,000.

TORMENTIL, an old provincial name for various species of Plantago (pav.), a plant applied to yield relief from the torment of laches.

TORNADO, from the Spanish torando, "a turning about," the local name given in various tropical and subtropical regions, notably Sene- gal, to violent whirlwinds or cyclones, with the usual accompaniment of electrical disturbances and downpouring rain. See CYCLONE; METEOROLOGY; WIND.

TORNADO ALARM, an apparatus which automatically gives an alarm when there is a sudden change of atmospheric pressure, such as precedes a tornado. It is a form of barometer in which the main mercury tube has a cylindrical bulb at the top and is bent in the form of a siphon. Near the lower portion of the shorter member is a secondary tube, the connection being made by means of a short tube connecting with the main tube by a very small opening. The fluid in both the larger tubes will remain normally of equal or nearly equal height in ordinary changes of the weather, but in case of sudden atmospheric changes the small opening in the connection between the tube restricts the movement in the secondary tube as compared with that in the main tube. Such variation in the movement of the mercury in the two tubes when sufficient to indicate an approaching storm, is made to give an alarm by means of floats in the tubes connected with wires in an electric circuit, there being on one wire a fork and on the other a tongue, by which contacts are made, to ring an alarm when the points meet. This alarm should sound some two minutes before the first blasts of the tornado. Ordinary storms have no effect on the apparatus.

TORNEA ELF, tor-ne’-ə elf (sometimes written Torné), Sweden, a river at the north which rises in Lake Tornea. Part of its course forms the boundary between Sweden and Finland, and then empties into the Gulf of Bothnia after a course of 275 miles. The town of Tornea stands at its mouth and on the opposite side of the river the Swedish town of Haparanda.

TORONTO, Canada, a city and lakeport: the capital of the province of Ontario, situated on the circular Toronto Bay between the mouths of the Don and Humble rivers, on the northwest coast of Lake Ontario, 313 miles west-southwest of Montreal and 60 miles in a direct line northwest of Buffalo, United States. It is the seat of the provincial government, of the higher law courts, of an important university and of the Department of Education of the province; it is also the cathedral city of a Roman Catholic and of an Anglican diocese. In commercial importance it is the second city in the Dominion, and, after Montreal, the chief railway centre. The Grand Trunk, the Canadian Pacific, and many branch lines connect it with the principal cities of Canada and of the northern United States, and it is the headquarters of the Canadian Northern and the Timiskaming and Northern Ontario Railway. The fine harbor, five miles long and one and a half wide, is formed by a long, low, sandy island, protected by imposing breakwaters; the island is, in summer, a favorite bathing and boating resort. A great scheme of development, which includes the deepening and extension of the harbor, land reclamation, boulevard construction and the creation of industrial sites is in progress. The city rises gradually from the water's edge to a height of 220 feet; it extends from east to west for about 10 miles along the lake shore and from north to south from three

Toronto has suffered from destruc-
tive conflagrations, notably in 1849, in 1890 and
in April 1904, when more than 100 buildings in
the wholesale business section were burned
down, some 533 persons lost their
property, and about $11,000,000 worth of
was destroyed. The industries of Toronto in-
clude a great agricultural implement factory,
iron foundries, shipbuilding, rolling stock, dis-
tilling and brewing, pork-packing, the manu-
facture of soap, tanning, aeroplanes, etc. The
city possesses a well-equipped system of public
libraries, with a fine reference library centrally
located, in which the John Ross Robertson his-
torical and ornithological collections are housed.
Shipping on the lakes is laid up in winter,
but during the navigable season several lines of
steamers connect with the principal ports on the
Great Lakes and the Saint Lawrence. The
lake commerce in lumber, grain, coal, cattle
and fruit is large. Toronto's bank clearings in 1917
were $3,004,785,565; customs revenue, $35,732-
400. The city has over 1,700 manufacturing estab-
lishments, employing 80,000 hands.

The name Toronto is derived from the Huron word, signifying "place of meeting." In 1749, when the French estab-
lished forts or posts through all the West and
down the Mississippi Valley, Fort Rouillé was
founded, on a site even then often called Fort
Toronto. In 1756 this fort, on the west side of
the present city, was destroyed to prevent its
falling into the hands of the English. In 1793
Governor Simcoe finding Niagara or Newark,
which lay almost under the guns of an Ameri-
can fort, too close to the frontier for the seat
of government, removed the capital to the other
side of Lake Ontario and established his head-
quar ters in a tent, on a site in the eastern part
of the present city. In 1813 Toronto, called
York by Governor Simcoe, was captured and
partially burned and looted, twice in the same
year, by the American army and navy. In the
first capture the American General Pike, the
discoverer of Pike's Peak, together with many
soldiers, was killed by an explosion. In 1834
Toronto was incorporated as a city with its
present name. In 1837 it was the chief scene of
a brief and ineffectual rebellion under Wil-
liam Lyon Mackenzie (q.v.). At that time and
often since Toronto has shown itself to be fer-
ently British in sentiment. Its later history
has been purely civic, without other interest than that attaching to prosperous growth. A
pleasant society and an attractive situation make
it a favorite place of residence. Population has
increased rapidly. In 1793, when Governor
Simcoe landed, there were only a few families.
In 1834 the population was less than 1,000. In
1861 it had increased to 44,821, in 1871 to 56-
092 and in 1881 to 86,415. In 1891, including
some annexed suburbs it amounted to 181,220,
and in 1911 to 376,240. Police census (1917),
353,271.

dding and Dent, "Toronto, Past and Presen-
Adam, "Toronto, Old and New"; and "The
Toronto Annual."

GEORGE M. WEONG,
Professor of History, University of Toronto.

TORONTO, Ohio, village in Jefferson
County, on the Ohio River, and on the Penn-
sylvania Railroad, 10 miles above Steubenville,
the county-seat. It is in a region in which
there are extensive beds of clay and large stone quarries. It is near the natural-gas fields of West Virginia. The chief manufacturing establishments are potteries, brick and tile works. The shipments are chiefly pottery, sewer pipe, terra-cotta and fire-brick. Pop. 4,271.

TORONTO, University of, situated at Toronto, Canada, the head of the educational system of the province of Ontario. The first step toward the establishment of the university was taken in 1797 when the council and assembly of Upper Canada petitioned the king for an appropriation of Crown lands for the purposes of education, and the establishing of a university. The appropriation was made, but nothing further was done toward the founding of the university until 1827, when it was chartered under the name of the University of King's College; the organization of the university was further delayed, largely owing to objections to the sectarian character of its charter, which was amended in 1837; and it was not till 1843 that it was opened to students. In 1849 the name was changed to the University of Toronto; in 1853 the university was further transformed by the organization of two corporations, known as the University of Toronto and the University College; to the latter was assigned the teaching in arts and the entire control of its students. In 1857 a further organization of the education of the whole university took place. Under what is known as the "Federation Act" the university became a teaching body once more, with faculties of arts, medicine, applied science and engineering, to which have been added since, faculties of education, forestry, household science and music. In the faculty of arts the subjects were divided as between the University of Toronto and University College, which may be termed the State Arts College, the complement of the faculty of arts of the university. In this reorganization of the faculty of arts there are now Victoria College, representing the Methodist Church of Canada; Trinity College, representing the Church of England; Saint Michael's College, representing the Roman Catholic Church—so that there are four arts colleges giving instruction in the same arts subjects, but sending their students to the university for instruction in other subjects, among which are mathematics, sciences, philosophy, political science, history.

The institutions which have close relations with the university are either federated or affiliated. Among the federated institutions, outside the arts colleges, are Knox College and Wycliffe College, while among the affiliated colleges are the Ontario Agricultural College, the Royal College of Dental Surgeons, the Ontario College of Pharmacy and the Ontario Veterinary College. These federated and affiliated colleges are represented on the senate of the university, which has charge of the educational policy. Each faculty has its own council and has charge of the discipline and control of its students, while the caput is made up of the chief executive officers of the university together with the heads of the federated colleges.

The university receives a very substantial grant annually from the government of the province of Ontario and is affiliated with the leading universities of Great Britain and Ireland, as well as with the General Medical Council of Great Britain.

The degrees offered by the university include arts, medicine, applied science and engineering, pedagogy, forestry and music, under the regular faculties, while through the affiliated institutions degrees are given in Fine arts, dentistry, agriculture, pharmacy, with diplomas in public health and physical training. Extension summer session work are carried on in the faculty of arts. The university is coeducational and had during the session 1918–19 an attendance of approximately 3,000, which is likely to develop to a greater attendance than in peacetime days, when the enrolment exceeded 4,000.

The important buildings are the main building, convocation hall, the library, household science, the various laboratories and wards. Toronto is the building of Victoria College Trinity College and Saint Michael's College.

TORPEDO, a genus of rays of the family Torpedinidae, most remarkable for their electric organs, which lie on each side of the body. (See Electric fishes.) The electric shock is powerful enough to kill small animals, specimens two or three feet long can be killed by a single discharge. A full-grown man, the family, which includes about seven genera and 15 species, is widely distributed over the Atlantic and Indian oceans; T. marmorata and T. maculata are two others common in the Mediterranean, and T. hemiops reaches the coast of Brazil. The American species T. occidentalis, which may reach a weight of 200 pounds; it is uncommon, is occasionally seen along the coast from Cape Cod to Cuba.

TORPEDO, Automobile. See Automotive Torpedo.

TORPEDO-BOAT DESTROYERS, or Anti-Torpedo Boats.

TORPEDO BOATS. The torpedo boat first made its appearance as an adjunct to the fleet in 1886. At that time its displacement was less than 100 tons, and its speed about 1 knot an hour. From that time on it gradually increased in size and speed, and by 1900 its displacement was about 125 tons and its speed about 23 knots an hour. The next evolution was the destroyer. This new type of vessel became necessary, for the dangerous character of the Agricultural College, for the University College, for the Ontario Agricultural College, the Royal College of Dental Surgeons, the Ontario College of Pharmacy and the Ontario Veterinary College. These federated and affiliated colleges are represented on the senate of the university, which has charge of the educational policy. Each faculty has its own council and has charge of the discipline and control of its students, while the caput is made up of the chief executive officers of the university together with the heads of the federated colleges.

The university receives a very substantial grant annually from the government of the province of Ontario and is affiliated with the leading universities of Great Britain and Ireland, as well as with the General Medical Council of Great Britain.

The degrees offered by the university include arts, medicine, applied science and engineering, pedagogy, forestry and music, under the regular faculties, while through the affiliated institutions degrees are given in Fine arts, dentistry, agriculture, pharmacy, with diplomas in public health and physical training. TURPEDO DRAG—TORPDEOES

made fast in boats, one on either side of the channel, and as the vessels proceed up and down the channel, abreast, the hooks on the rope below the drag are cut and the torpedo is thrown ahead of a vessel by a small mortar and is drawn in by a windlass; this is to clear the channel through which the vessel must pass.

TORPDEOES. Torpedoes or explosives moving through the water to the object attacked, distinguished from the mine or stationary explosive, first took the form of what was in reality a towed mine. The Harvey, Menzing and the various French towing torpedoes were weapons of this kind. The torpedo was towed astern of a launch with a rig that permitted a rudder on the torpedo being controlled from the towing boat. The torpedo could be guided to a position on the quarter, while a second torpedo was towed astern. By means of a dipping or detaching apparatus, when the wider part of the torpedo touched the target, the torpedo would become completely submerged before the explosion took place. Torpedo warfare received great impetus during the Civil War, various types being developed by both the Confederates and the Federals. Dragging for torpedoes and the use of torpedo nets dropped over the sides of vessels were then first practised, but there appears to have been no use of submarine boats until more recently. During this war the spar or outrigger torpedo came into active use and on more than one occasion during that period and later proved its worth. This weapon consisted of a torpedo carried at the end of a spar or pole which projected from a launch. It was so arranged that just before the target was struck, the torpedo could be plunged below the surface to obtain the holding or plugging effect of the water for the explosion. The explosive usually consisted of about 33 pounds of gun cotton which could be fired upon contact, or at will, by employing a firing battery. To carry and drive home the spar torpedo a fast seaworthy launch or small torpedo-boat was employed.

In its early stages of development, battle ranges seemed logically to keep the torpedo in the background, except at night, when the speedy torpedo-boat counted upon getting near enough to launch its weapons with a more reasonable promise of making a hit. The naval constructor, accepting the torpedo at its potential value as seen by the majority of the fighting officers simply limited his efforts to fabricating the under-body of his fighting craft so that the damaging effects of a chance blow from a torpedo should be confined to a restricted area. Hence the inner bottoms, and the water-tight, cellular division of the intervening space. As a matter of fact, the naval constructor’s work stood up under torpedo attack and performed its function remarkably well. It is a matter of record, that the general run of torpedoes fired during the Russo-Japanese War did far less damage than was expected of them, and a goodly number of vessels so struck were not sunk as was counted upon, but were able to get into port and be repaired. There were ships lost to both belligerents by subaqueous attack, but the most conspicuous of these disasters were due

placing of about 1,100 tons (with a speed of about 32 knots per hour) having been reached and determined by most nations from a consideration of the strategic and tactical duty of the fleet with which it serves. The offensive weapon of the destroyer was originally the gun, but after the torpedo boat disappeared the torpedo became the important weapon and the guns were retained for defense only. The prominent characteristics of the destroyer were high speed, seaworthiness, moderate radius of action and plurality of torpedo tubes and torpedoes. To enhance these characteristics increased size was necessary and this lessened the chance of being able to surprise an enemy on the alert, and surprise was a corollary in its usefulness. These considerations tended to limit the size and when sufficient tonnage for necessary offensive work was gained, no further increase was thought justified. The present tendency is to increase the destroyer's gun power for offensive purposes against the submarine and this brings the destroyer back to the original conception of the use of that type. The latter development will undoubtedly be toward high speed, moderate size, long-range torpedoes, a plurality of small guns and large radius of action. The destroyer, supported by large cruisers, makes an excellent offensive force, especially when armed with long-range torpedoes. Making contact in the daytime with an enemy's fleet, destroyers can, at night, readily slip through the screen and attack the enemy while in its night formation.

The co-ordinated destroyer force becomes an important asset to a fleet when about to go into battle. A well-timed feint upon the battle line of the enemy may give to its own battle line a very important advantage of position. By the intelligent use of a smoke screen, made by emitting large volumes of oil smoke from destroyers' smoke stacks, a battle line in confusion can be rescued from destruction and permitted to reform or to escape. In the battle of Jutland the German fleet was concealed in a smoke screen formed by German destroyers at the time when the main British fleet was about to bring a superior force against it. When the smoke cleared it was observed that the German fleet had extricated itself from danger.

While the first duty of the destroyers was to run down attacking torpedo boats and sink them with the fire of their small rapid-fire guns, it was also armed with torpedo tubes in order that it might be used as an attacking torpedo vessel and to defend the battleships at night. The smaller type of torpedo vessel—the torpedo boat—was classed as a weapon of defense, employed to guard the home coast from raids by the enemy's warships, while the larger was regarded as an offensive weapon, used to destroy the smaller type and allow capital ships to perform, without danger, their duties of blockade and various war measures. See SUBMARINES.

EDWARD S. FABROW
Consulting Military and Civil Engineer.

TORPEDO DRAG, a device for clearing harbors, river-channels, etc., from floating torpedoes and submarine mines. It consists of a long cable, bearing grappling hooks set at frequent intervals. The ends of the cables are
to the violent blows of passive mines. Where the active torpedo had failed in its mission the anchored floating mine filled the offensive gap. These mines carried larger explosive charges than the torpedoes then in service, and proved two things: First, that the naval constructor had planned well; and, second, that the automobile torpedo must needs be made a more powerful weapon if it were to fill the office intended for it. The German Arthur were several vessels that had been built by the French for the Russian government. In addition to the usual compartmenting of the inter-bottom space, the French designers had reinforced the region most likely to be attacked by torpedoes by means of a caisson built of plating nearly two inches thick. The object of this caisson—assuming that the explosion of the torpedo should be sufficient to rend or rupture the plating of the inner and outer bottoms—was to provide more space in which the guncotton gases could expand and dissipate the most dangerous percentage of their remaining force. The ingenious theory of this style of construction proved true all that its originators claimed for it. The Russian ships so built were several times hit by Japanese mines, and while grievously wounded over wide areas of their under-bodies, yet the caissons remained substantially intact and the vessels were able to return to harbor.

The automobile torpedo first came into use in the early seventies. It was the outcome of a series of experiments commenced in 1864 by Robert Whitehead, then superintendent of iron works at Flume, Austria. This torpedo, known as the Whitehead or fish torpedo, claimed the following capabilities: (1) It could be adjusted to run at any depth from 5 to 15 feet when fired from either a submerged or surface tube, or from a surface-detecting apparatus; (2) upon firing, it would make a straight run, provided a proper allowance was made for the deflection due to transverse currents; (3) it could be adjusted to stop at any distance up to its extreme range; and after stopping to sink or float; (4) it could make a run of 1,000 yards at a speed of 15 or 16 knots, while 300 yards could be covered at a speed of 19 to 20 knots; (5) it could carry a warhead holding a charge of 15 pounds of guncotton, to explode upon contact. This torpedo was propelled by a three-cylinder Brotherhood engine weighing 35 pounds, driving two propellers and developing 40 horse power. Eventually the Whitehead torpedo came to be used in the United States service, and later the Bliss-Leavitt torpedo was adopted. As heavier armor was added against torpedo attack a large gap developed which the Whitehead torpedo and its various kindred rivals could not fill, and here it was that the sea came in. Commander Cleland Davis, placed the modern upon a new and more formidable footing. He abandoned the guncotton warhead, which was the accepted instrument of destruction since the invention of the Whitehead, and substituted a water-drowned explosive gun which was water-drowned and could not sink unprotected freight and passenger ships at close range. It is capable of a speed of more than 30 miles per hour and when traveling at normal sea speed. It contains high explosive charge, fired by an air explosion upon the type of torpedo; (2) The air flask, a specially constructed shell of steel, very strongly built to withstand a test pressure of 5,000 pounds to the square inch. This flask carries water at an initial pressure of 2,200 pounds per square inch, the air being used to operate all
echanism of the torpedo in addition to motive power; (3) The depth control
nism, which permits the torpedo to be t and desired depth without surfac
consists principally of a pendulum and a stati
geoscoptic steering gear. The gyroco
compass through the vertical rudder
the torpedo on a course parallel to 1
(5) engines. The air at the high pressure
ounds per square inch first passes through
its range, the effective hits that. In
use of destroyers and battleships, the tor
may be projected from submerged tubes
m deck tubes. In general, torpedoes are
ed from submerged tubes by compressed
d from deck tubes by a small charge of
d\nner, or may be designed to use either powder
pressured air. When the torpedo is fired
a submerged tube the compressed air or
s from the powder follows the torpedo
t the tube with a rush and causes an	on the surface of the sea, which is
for a considerable distance. As a re
us to the warning given by this eruption,
sometimes been able to escape the
oes by a quick manoeuvre. The modern
is self-propelled, being driven through
cooper's agent by its own compressed air motor,
being supplied from a strongly-built
within the body of the torpedo itself.
diers when operated by internal com-
engines as motive power are not trust
. The range of a torpedo is approxi-
a mile, those designed for use on battle-
destroyers being longer ranged than for
use on submarines. The great diffi-
getting proper direction and sufficient
power to give the required speed for a
uration of time renders the long range
practicable. The latest German tor-
range of about 2,000 yards, as the
ded air storage reservoir was reduced
order to increase the charge of high
ive in the warhead. The charge was
0 to 400 pounds. The depth at which
do travel may be regulated to hit the
part of the vessel, and that is usually
feet below the surface. In case of
attack against an armored ship the
be dangerous, should strike be-
armor belt, which usually extends
below the water line. Torpedoes
ually provided with means to cut, more
effectively, through nets placed in their
The detonation of the torpedo is ac-
through a mechanism placed within
head; and if the speed is checked in
motion, the firing mechanism ignites
the heavy charge of explosive
contained within the warhead. It is not neces-
sary to strike a firing pin on the end of a tor-
pedo to detonate the charge. Many sugges-
tions have been made for a torpedo elec-
tically propelled from a ship by means of
flexible cable connecting it with the ship.
This was the first type of torpedo built, but
was discarded for the present dirigible type,
as the weight of cable, difficulties in insulat-
etc., render it of little practical value. The
effectiveness of the Hammond radio-controlled
torpedo is promising. The Board of Ordnance
and Fortifications recommended favorably to
the Secretary of War as to the merits of this
invention, and the Secretary recommended to
Congress that this new type of weapon be in-
stalled in a few of the more important coast
defenses.

When firing a torpedo at a moving target
there are several important factors which
the torpedist must consider. These are the speed
of the target, the course of the target and the
speed of the torpedo itself, all of which factors
must be known within limits in order to make
effective hits. The British and the Germans,
French, Whitehead and Schneider; the Japan-
es and Italians, the Whitehead. In the United
States the Whitehead and Bliss-Leavitt torpe-
does are in general. See Naval Mines; Sub-
marine Mines; Submarines.

Consulting Military and Civil Engineer.

TORQUAY, for-kē', England, a fashionable
watering place in Devonshire, situated on the
south coast, 26 miles northeast of Plymouth,
named from the Tor Abbey nearby, which
was founded in 1196. It is built on a series of
terraces rising from the beach, and is a much
frequented bathing and winter resort. It con-
sists largely of villas and gardens, and has a
fine promenade, public parks, libraries, a mu-
seum, electric light and an excellent water sup-
ply and drainage system. There are manu-
factures of terra-cotta ware, and trade in coal
and marble. The name also applies to the
borough and the Parliamentary division in
which it lies. Pop. of the borough about
39,000.

TORQUE, an ornament of twisted gold or
other metal, worn as a collar or a necklace
by the ancient peoples of Asia and northern
Europe. It consisted of a circle of stiff gold,
twisted except at the ends, which remained
straight or which in some cases were looped
back, so as to overlap. Such collars were con-
sidered a characteristic ornament of the ancient
Gauls and are said to have been so abundant
that about 223 a.c. Flamininus, the general of
Jupiter a golden trophy made from torques of
conquered Gauls. The Torquati, a family of Manilian gens, attribute their name to their ancestor T. Manlius, who having slain a giant Gaul in single combat, was lifted from the neck of the dead body an enormous gold torque, which he ever afterward wore upon his own.

TORQUEMADA, Juan de, hoo-an’ dâ tór-kä mâ-thâ (Latinized form TURRECREMATA), Spanish theologian and cardinal; b. Valladolid, 1388; d. Rome, 26 Sept. 1468. He entered the Dominican order, was graduated at the University of Paris in 1424. After serving as prior at Valladolid and Toledo, he was appointed by Eugenius IV master of the sacred palace in 1431. In 1439 he became a cardinal-priest, later exchanged his title for the cardinal-bishopric of Albano, and still later (1464) for that of Sabina. He gave liberally of labor and money to charities and church-building, and won fame as a theological writer and controverist. He was an influential member of the councils of Constance, Basel and Florence, at the last-named of which drew up the proposals for union between the Greek and Latin churches. Among his works may be mentioned 'Meditations' (1467), 'Questiones Spinolesis' (1470), 'De verauris et Evangelis' (1477); and 'Commentarii in Decretum Gratiani' (1519). Consult Lederer, 'Der spanische Cardinal Johannes von Torquemada' (1879).

TORQUEMADA, Tomás de, Spanish monk, first Grand Inquisitor of Spain: b. Valladolid, 1420; d. Avila, 16 Sept. 1498. He entered the Dominican order, was for 22 years prior of the monastery at Segovia, and in October 1483 was made by Sixtus IV inquisitor-general for Castile and Leon. The Inquisition (q.v.) had been established in 1480 at Seville, but Torquemada was the first to give it its organization. He founded four tribunals at Seville, Cordova, Jaen and Villa Real. During his 18 years of office he burned 10,220 persons and condemned 6,800 to be burned in effigy. By these methods the Inquisition acquired vast sums of money. Torquemada was justly hated, and never went about without a body guard. His later activities were directed against the Jews and about 1,000,000 of them fled the country to escape his persecution. He was one of the most bloodthirsty fanatics of history. Consult standard works on the history of Spain and of the Inquisition; also Molines, 'Document Inédits. Torquemada et l'Inquisition' (1897).

TORRE DEL GRECO, tór-re dël gra’ko, Italy, on the Bay of Naples, seven miles south-east of Naples at the foot of Vesuvius. The town has been demolished by earthquake at various epochs, and in 1857 and 1906 a similar disaster greatly changed and damaged the locality. It is much frequented by foreigners and the luxurious Italians on account of its sea-bathing. There are important coral and other fisheries, besides shipyards, manufactories of rope, coral goods and lava ware. Pop. of commune about 3,000.

TORRENCE, Frederic Ridgely, American poet: b. Xenia, Ohio, 27 Nov. 1875. He was educated at the Union University, was librarian in the Astor Library 1897-1901, and since 1901 at the Lenox Library, New York. He has published 'The House of Hundred Lights' (1900); 'El Do'Tragedy' (1903); 'Aubard and Helen' and other dramas, 1909.

TORRENES, William Erskine, a promoter: b. New York, 15 July 1870; d. 1914. After making a study in New England and Philadelphia of mining methods and finance, he became foreign commissioner for the Canadian Imperial Bank of Commerce in 1899, and was subsequently engaged until 1909. During his time he secured concessions from Brazil, Argentina, Cape Colony, China and Japan for establishing sample works and the exhibition of American manufactures. He has written 'Commercial Travels in South America' (1897); 'Commercial Travelling in South Africa' (1898); 'Commercial Travelling in the East' (1899).

TORRENS, Lake, South Australia, a shallow salt lake, the central one of a chain in the central southern section, 125 mi. and 25 miles wide, about 80 miles from Spencer's Gulf. In the dry season duced to a salt marsh.

TORRENS SYSTEM, a system of registration devised by Sir Robert Town and first successfully used in Australia. The object is to make the transfer of landed property simple and as safe as that of any other property and to do away with the necessity of repeated title examinations. The system operates through a bureau of registered charge of a registrar, and becomes the first transfer of any property at establishment of the system, all land being registered in this office. A title registered as absolute or as possessory, or registry the title is fully investiga the registrar, who receives from the owner the documentary evidences of title, deeds, of boundaries, etc. When the registrar is satisfied that the title is perfect, he files the old papers and issues the certificate of ownership, a duplicate of which is filed in the registrar's office. Such certificate bears on its face notice of any interest on the property. If the estate is vested in simple title is known as 'absolute' certificate is stated to be an absolute. Should it appear that an absolute to any land can be held only for a period or subject to reversion, then the of title, right or interest arises the specified date or under the named, all of which will be entered in register and noted on the certificate is stated to be a 'qualified' certificate the case of a 'possessory' title the name registered as becoming owner on evidence of title as may be prescribed. Registration of any person as first of a possessory title only will not interfere with the enforcement of any estate, or adverse to the title that may in which may arise a later date. And is noted on the 'possessory' certificate to the owner. The registration of title does not have to be repeated a certificate has once been issued, the
TORRENTS OF SPRING ('Veshchera Vo'dui'), by Ivan Sergeevitch Turgotin, is the tragic-comedy of a man of weak will who succumbs to a passionate impulse, yields to the seductions of the typical "vampire" woman and throws away the happiness of his whole life. "Weak men," says the author, "never bring things to an end; they always wait for the end to come." The title is symbolical and not quite adequate, the comparison being introduced in the wrong place.

Sànin, a young nobleman, is in his 22d year, very good-looking, with handsome graceful figure, kindly bluish eyes, golden hair, a clear skin, a smile like a child's and giving the impression of "freshness, health and softness, softness, softness," a man "recognizable at a glance as the son of a sedate aristocratic family, the type of the fine young pom'eschik, born and reared in our wide steppe-like regions." On his way home from Europe to Russia he is detained for a few hours at Frankfurt-am-Main, and by chance drops into a confectioner's shop conducted by the widow of a Lutheran minister. It happened that just at that moment Emilio the only son had faited and his sister, Gemma, a young girl of exquisite beauty appeals to Sànín to bring him back to life. This the young man does; the family are profuse in their expressions of gratitude and persuade him to remain for a few days in Frankfurt. During a Sunday excursion with the two young people and Gruber, a bumptious and conceited German clerk to whom Gemma is betrothed, an intoxicated officer, Baron von Dönhof, insults the young girl, and when her lover shows no spirit to resent it, Sànín impulsively takes it upon himself to provoke the inevitable duel. This duel is described at considerable length with a wealth of comic detail. Neither party is injured and the Russian and the Baron part almost friends.

It results, however, in Gemma's breaking her engagement with the ridiculous and pusillanimous Gruber, but Signora Roselli hogs Sànín to use his influence with her daughter to persuade her not to ruin her prospects and reputation by such an act, an engagement being regarded in Germany as no less sacred than marriage itself. Sànín reluctantly undertakes to fulfill this delicate mission but finds it impossible, since he has himself fallen in love with the beautiful girl and she is no less fascinated with him. He decides to sell his estate in Russia and invest money in the widow's confectionary business. By another turn of fate he meets at this moment his former schoolmate, Póllozof, another type of the lazy, easy-going Russian, who is married to an enormously rich young woman. Póllozof tells Sànín that his wife will perhaps buy his estate and offers him a place in his carriage to Wiesbaden where Mária Nikolayevna is taking a cure. She is beautiful but unscrupulous and plays all her arts to fascinate Sànín, who weakly yields and never returns to Gemma. Thirty years later Sànín, always unhappy in his remorse for his dastardly behavior, with a little garnet cross which Gemma had given him. It brings up all the details of his soul's tragedy. He goes to Frankfurt and through Baron von Dönhof learns that Gemma had married a rich American. He writes to her and when she replies,
enclosing a photograph of her own daughter, he sees in the picture the very image of his lost love and sends her the garnet cross together with a magnificent string of pearls. Gemma is the very ideal of sweet girlish purity and is presented in striking con-
trast with the fascinating and not unsmys-
pathetic Russian siren who ruins men for her
selfish amusement. It is an amusing and yet
rather repulsive story. Originally published in
the European Messenger (Pesoithi Velovokup)
in 1872, it has been translated as 'The Torrens of
Spring' by Constance Garnett (1897); 'Spring Freshets' by Isabel F. Hapgood (New
York 1904); 'Spring Floods' by S. M. Butts
(1874-75), and by E. Richter (London 1896).
NATHAN HASKELL DOLE.
TORGES NAHARRO. B. de., Spanish
dramatic poet: b. near Badajoz, about 1500.
He is called the creator of Spanish comedy
and was the first writer of his time to develop
fully his plots. He wrote fluently in both
poetry and prose and his collected works
were dedicated to Ferdinand d'Avalos, the husband
of Vittoria Colonna. It was not until 1520,
however, that his plays became known in Spain
where they were very popular.
TORGES (tôr'res) STRAIT, the narrow
channel which separates Australia and Papuan From Cape York on the northern coast
of Australia to New Guinea it measures about 80
miles. Navigation is unsafe owing to the
shoals, islands and reefs within its waters. It
was discovered in 1606 by a Spanish navigator
from Peru.
TORGES VEDRAS, tôr'res vá'drás, Por-
tugal, a town in the district of Lisbon, situated
on the railroad, 25 miles north of Lisbon. It
is noted for its extensive lines of fortifications,
28 miles long, reaching to the Tagus River, and
protecting 500 square miles of territory. They
were begun in 1809, and behind them Welling-
ton in 1810 checked the French advance toward
Lisbon. It has hot sulphur baths and an old
Moorish citadel. Pop. about 8,000.
TORMEY, tör'l, Bradford, American nat-
1842; d. New York, 19 Feb. 1899. He was educated in the public schools, taught two years, entered business in Boston, and for many years after 1866 was a member of the editorial staff of the Youth's
Companion. He has been well ranked as a
field ornithologist, and wrote entertainingly of
his observations. His essays have been collected into the following volumes: 'Birds in
the Bush' (1885); 'The Foot-Path Way' (1892).
'A Florida Sketch-Book' (1894); 'Spring
Notes from Tennessee'; 'A World of Green
Hills' (1898); 'Every-Day Birds' (1900);
'Nature's Invitation' (1904); 'Friends on the
Shelf' (1906); 'Field Days in California'
(1913).
TORMEY, Charles Cutler, American Se-
1863. He was educated at Bowdoin College
where he taught Latin (1885-90). He studied
at Andover Theological Seminary (1886-89)
and at the University of Strassburg (1889-92)
where he took his Ph.D. degree. Since that
time he has been in touch with languages at
Andover (1892-1900), director of the Ameri-
can School of Oriental Research in Palastine
(1900-01), editor Journal of the American
Oriental Society (1900-07; 1911-16) and presi-
dent of the society (1917-18). His publica-
tions include 'The Commercial-Theological Tens
in the Koran' (1892); 'Composition and His-
torical Value of Ezra-Nehemiah' (1896); 'The
Mohammedan Conquest of Egypt and North
Africa' (trans. from the Arabic, 1901); 'Sele-
cions from Bokhari' (1906); 'Notes on the
Arabic past of Daniel' (1909); 'Ezra Studies'
(1910); 'Composition and Date of the Aras
(1916). Since 1900 he has been attached to
Yale College.
TORMEY, Charles Turner, American
anti-slavery reformer: b. Scituate, Mass., 21
Nov. 1813; d. Baltimore, Md., 9 May 1846. He
was graduated at Yale in 1830, entered the Congregational ministry, and held pastorates at
Princeton, N. J., and Salem, Mass. Having re-
moved to Maryland to promote the cause of
anti-slavery, he became an active agent of the
Underground Railroad (q.), and was arrested
and imprisoned on the charge of being a
slaveholders' convention held in Baltimore.
The following year he was again arrested and
being convicted of aiding in the escape of run-
away slaves, he was sentenced to a long term
in the penitentiary. The harsh treatment he
received while undergoing his sentence brought
on consumption from which he died, and his
remains were taken to Boston where he was
honored by a public funeral. He was regarded
as a martyr in the cause of freedom, and Torme-
ry's blood cried out' became an anti-slavery
watchword. He wrote 'A Memoir of William
R. Saxton' (1838), and while in prison pro-
duced a volume of sketches of Massachusetts
life, 'Stone, or the Pilgrim's Faith Revived'
(1846). Consult Lovejoy, 'Memoir of the
Martyr Torrey' (1847).
TORMEY, John, American botanist: b.
New York, 15 Aug. 1796; d. there, 10 March
1873. He received his first instruction in botany
mineralogy and chemistry from Amos Eaton
and was graduated at the New York College of
Physicians and Surgeons in 1818. His skill from medical practice he devoted to
pursuits, particularly to botany, and in
abandoned medicine and became professor of
chemistry, mineralogy, and geology at West
Point. From 1827 to 1855 he was professor of
chemistry and botany at the College of Physi-
cians and Surgeons, serving simultaneously at
Princeton. From 1853 until his death he was
chief assayer in the United States Assay Office;
New York. He participated in the Columbian Exposition as trustee, and in 1860 pre-
sented to that institution his extensive her-
barium and botanical library. In his special
field of scientific research his publications were
numerous. One of his earliest was a 'Catalogue of Plants Growing Spontaneously
Thirty Miles of the City of New York' which
he prepared for the New York Library of Natural History (now the New York
Women's Institute of Science), of which he was a
and for many years president. In the
botanical of the Geological Survey of New
York he published an elaborate work on the flora
of the State. Meantime he had issued in com-
mission with Asa Gray (q.), the first of a
series of articles on 'The Flora of North America' which was discontinued after the completion of

order Compositae. From 1845 onward he published memoirs and reports on the botanical specimens brought back by expeditions to various parts of the West and South by Capt. John C. Fremont and others, among them being reports on the botany of the Pacific railroad and making the Mexican boundary survey. He was president of the American Association for the Advancement of Sciences in 1860 and was in the American Academy of Arts and Sciences in 1863 one of the original members of the National Academy of Sciences.

Torrrey, Joseph, American clergyman: b. Rowley, Mass., 2 Feb. 1797; d. Burlington, Vt., 26 Nov. 1867. He was graduated at Dartmouth in 1816, and at Andover Theological Seminary in 1819. He was for a time pastor of a Congregational church at Royalton, Vt., but in 1827 became professor of Greek and Latin at the University of Vermont. In 1842 he took the chair of philosophy there, and in 1863 he was president of the institution. He translated Neander's 'General History of the Christian Religion and Church' (1854), and edited 'Remains of President James Marsh' (1843) and Select Sermons of President V eh P. Smith' (1861). A volume of his lectures, 'A Theory of Fine Art,' appeared posthumously (1874).

Torrrey, Reuben Archer, American evangelist: b. Hoboken, N. J., 28 Jan. 1856. He was educated at Yale College and at Leipzig and Erlangen in Germany. He was ordained as a Congregational minister in 1878, was superintendent of a large church in New York City, and became associated with Dwight L. Moody in 1889 and served as superintendent of the Moody Bible Institute until 1908. In 1902-03 he made an evangelistic tour of the world. His life has been devoted to evangelistic work in many lands and he has written much on Bible subjects which have been translated in a score of languages.

Torrrey Botanical Club, a botanical society in New York, which is the most important organization of its kind in America, and one of the most scientific societies affiliated in the Scientific Alliance. The club was an outgrowth of a former club, chartered in 1871. This had met in the herbarium of Columbia College, drawn there by the genial welcome and wide botanical knowledge of its presiding spirit, Dr. [John] Torrey, and was the nucleus of the present club, finally organized under its present name, complimentary to Dr. Torrey, in 1873. Dr. Torrey was the first president, but, unfortunately, died almost immediately.

The Torrey Club is the centre of botanical interest in New York, and the neighborhood, and is especially valuable for its weekly excursions that may be joined by any botanist, and which take parties out to good botanizing localities under intelligent guidance. Many local floras have been compiled by members of the club, one of the most important of which is of the plant life of the Rocky Mountains. 'The Preliminary Catalogue of Anthophyta and Pteridophyta growing within 100 miles of New York.' The valuable herbarium of the club includes the material for this list, and specimens of the flora, within the same area. It is now deposited at the New York Botanical Garden, which was originated and developed by members of this society. The club issues three regular publications, namely: Bulletin, a very scientific and widely known journal; Torreyo, of more popular scope; and Memoirs, which include many valuable monographs for ascertaining the most practicable route for a Pacific railroad and making the Mexican boundary survey. He was president of the American Association for the Advancement of Sciences in 1860 and was in the American Academy of Arts and Sciences in 1863 one of the original members of the National Academy of Sciences.

Torrivecelli, Torr-ree-chell, Evangelista, Italian mathematician and scientist: b. Faenza, Italy, 1608; d. Florence, October 1647. He early devoted himself to mathematical studies, and having read Galileo's 'Dialogues,' composed a tractate concerning motion, entitled 'Le principia.' Galileo having seen this, conceived a high opinion of the author, and engaged him as his amanuensis. He accordingly went to Florence in October 1641, but Galileo dying three months after, Torrivali returned to Rome, where he was engaged in the discovery of the natural law according to which fluids rise in an exhaustted tube from an open vessel exposed to the pressure of the atmosphere, namely, that the weight of the fluid which rises in the tube is equal to the weight of an equal surface of atmospheric air of the height of the atmosphere. He also improved the telescope and microscope. See BAROMETER.

Torrivecellian Experiment, The, so-called because made by the Italian physicist Evangelista Torrivali (q.v.), who discovered the principle upon which barometers are made. Torrivel was led to investigate Galileo's theorems of the law that "nature abhors a vacuum." He filled a glass tube, closed at one end, with mercury, and placing his finger over the open end inverted the tube. He now placed the tube vertically in a small trough containing mercury and removed his thumb from the open end, after it was under the surface of the mercury. The mercury in the tube dropped until it stood at a height of about 30 inches. Here it rested, with a vacuum in the top of the tube, under the closed end. Torrivel concluded that the column of mercury in the tube was sustained by the pressure of the atmosphere on the larger surface of the mercury in the trough and that the height of the column was in inverse ratio to its specific gravity. Other experiments confirmed this theory and led to the invention of the barometer (q.v.).

Torrigiano, Pietro, Pë-trë tór-rë-jea'n°, Italian sculptor: b. about 1470; d. Spain, 1522. He went to England in 1509 to erect the tomb of Henry VII and his queen, still in Westminster Abbey. The works which he executed for English churches were destroyed by the Puritans. He was given a commission to make a statue of the Virgin Mary, and receiving what he considered an inadequate price destroyed it. For this he was imprisoned by the Inquisition, and there starved to death.

Torrington, Frederick Herbert, Canadian musician: b. Dudley, England, 20 Oct. 1837, and was educated there. When but 16 years of age he was made organist (1853) at Saint Anne's Church at Bewdley, England, and in 1857-69 he held a similar position at Great Saint James Street Methodist Church, Montreal, Canada. He then went to Boston where
he was organist in Kings Chapel (1869-73) and professor in the New England Conservatory of Music. Returning to Canada he became organist of the Metropolitan Church at Toronto and conducted the Philharmonic Society there and founded (1881) the first Toronto musical festival. Two years later (1883) he founded the first college of music. He was elected president of the Canadian Society of Music in 1892. In 1895 and 1896 he conducted musical festivals at Toronto and in 1903 was assistant conductor of the cycle of musical festivals in that city.

Torrington, Tör'ing-ton, Conn., borough in Litchfield County, on the Naugatuck River, and on the New York, New Haven and Hartford railroads, about 23 miles west of Hartford and 18 miles north of Waterbury. Settlements were made in the vicinity in the early part of the 18th century, and in 1740 Torrington was incorporated. In 1887 it was chartered as a borough. It is the birthplace of John Brown (q.v.). The borough has a number of manufacturing establishments; chief among which are bicycle and machine shops, plate-works, brass-works, wooden mills and novelties. It also manufactures needles, hardware and tobacco products. In 1914 there were 54 manufacturing establishments, with a capital of over $16,000,000, and annual products of over $14,000,000, with payrolls of about $2,000,000. The principal public buildings are the churches, schools and the Young Men's Christian Association building. The educational institutions are a high school, public and parish schools, several private schools and a public library. There are two banks. The borough is the commercial and industrial centre of the town of Torrington, which contains 20,000 inhabitants.

**Torsion Balance**, an instrument in which small forces are measured by noting the torsion that they can produce in a fine wire or a delicate fibre of some other material. The invention of the instrument is usually ascribed to Cavendish and Bunsen, but its employment having been suggested by C. V. Boys, it was his extensive researches on electricity, Cavendish also made use of it for the purpose of determining the mass of the earth; his experiment consisting in determining the attractive power of a pair of leaden spheres, and comparing this with the attractive power of the earth itself. In its conventional form, the torsion balance consists of a light horizontal arm, suspended at the centre by the fibre whose torsion is to measure the force that is applied to the arm. Quartz is now extensively used for the suspending fibre; its employment having been suggested by C. V. Boys, who showed how to prepare fibres of this material, which are very strong and elastic. Boys divided an arrow into matched halves and then fastened the arrow from a length midway the centre to a single fibre of quartz. The upper end of the fibre was attached to a graduated hook whereupon the fibre can be twisted through one entire turn; and a simple motion then gives the repulsive force designed application of the torsion balance to the measurement of mental work of other kinds will be understood from the foregoing description of application to the measurement of electrical pulsions; for the principles involved are the same in all cases, the force that is produced being determined by noting the torsional moment of the fibre, which is proportional to the angular displacement of the fibre. In actual service the balance is surrounded by a case of glass, the air in which is kept dry by a close-fitting calcium chloride, or phosphorus crucible, or paraffinum stone wetted with a sulphuric acid or some other powerful volatile drying agent.

The torsion balance has also been used in a form of commercial instrument in which the weight is supported from a central ribbon of string in such a manner that when the
TORSIONAL RIGIDITY — TORTICOLLIS

at either end, the steel ribbons are d to a torsional moment which tends to the balance to the normal position of the.

Allan D. Risteen.

TORSIONAL RIGIDITY, that species of y by which a cylindrical bar of any ma-resists the action of a force (or "couple") tends to twist the bar in such a manner inerit its originally straight, longitudinal axis (or fibres) into a helical form. The rigidities of a pair of cylindrical bars tical dimensions but composed of difer-bstances may be compared by comparing vising moments that are necessary in to twist both of them through the same angle. If one end of such a cylindrical held fixed, while the other end is twisted ever applied to it after the manner of a t, the angle x, through which the bar will

\[ \theta = \frac{M}{g R} \]

\( g \) the length of the bar that is twisted, ug its diameter, and C being a constant r. of material of which the bar is made; while P and R are respectively the g force, and the length of the lever to d of which this force is applied. The um diameter that a shaft should have, in to transmit a given horse power safely, e calculated by the following formula:

\[ \sqrt{\frac{V}{H/R}} \]

where D is the diameter of the n inches, H is the number of horse power transmitted, R is the number of revolu- the shaft per minute, and F is a numeri-ter peculiar to each kind of material. For ht iron, F may be taken as about 4, and sel it may be taken as 3.8. Consult Kent, anical Engineer's Pocket Book; Ran- Applied Mechanics.

ORSK, a Scandinavian species of cod. See

ORSO, an art term applied to the trunk statue of which the head and limbs are g, or to the trunk of a statue considered endently of the head and extremities; also termed one of the shoulders by the Greeks of ancient sculpture recovered in the r centuries have been incomplete in this. The most famous is the Torsos Belve-s a torso of a statue of Hercules, seated. ives its name from the Belvedere, at in the Vatican Palace where it is pre, and is attributed to the school of us, being believed by some authorities to work of that master, although a Greek ascribes it to the artist Apollonius. considered by connoisseurs one of the works of art remaining from antiquity.

Rstensson, tor'ste'n-sen, Lennart, sh general: b. Torstena, 17 Aug. 1603; d. Holm, 7 April 1651. At 14 he became a c the court of Gustavus Adolphus and 3 accompanied him to Germany as cap- the bodyguard. He was commander of y at the battle of Lech, 5 April 1632, ken prisoner before Nuremberg in August in Ingolstadt. In 1641 he was ap-1 commander-in-chief of the Swedish in Germany. He defeated the Archduke Leopold and Piccolomini at Breitenfeld, 2 Nov. 1642, threatened Prague and relieved Olmütz in 1643, and after the declaration of war by Den-mark in December he advanced into that country and in six weeks had conquered the whole peninsula with the exception of the fortresses Rendsburg and Glückstadt. He defeated the Austrian general, Gallus, at Jüterbok, 4 Nov. 1644, and Katzfeld at Jankau, 6 March 1645, pushed through Moravia to the Danube and de-stroyed the fortifications on Wolfssbrücke be-fore Vienna. His siege of Brünn was unsuc-cessful owing to the stubborn defense and a pestilence among his troops, and after with-drawing into Bohemia, in 1646, he was com-pelled by illness to resign his command. He was made Count of Orta and governor-gen-eral of West Gothland by Queen Christina in 1647.

TORT is a legal term indicating an injury or wrong; tort may be committed with force, as trespass which may be an injury to the person, such as assault or false imprisonment or to property in possession, or a tort may be com-mitted without force, such as an injury to one's character or affecting one's personal liberty. One may be liable in damages for a tort, but same is distinguished from a similar right growing out of a contractual relation. An ac-tion in tort is a civil action which undertakes to discover if a wrong or crime is involved. A misappropriation of funds by a trustee, for ex-ample, must be inquired into before it can be certainly known: (1) that the fund is short; (2) that the defendant is responsible for the shortage; (3) whether there is a question as to the amount of the misappropriation; (4) whether the defendant simply owes such short-age, or (5) whether he stole it, and should be arrested. Actions in tort are common in cases of breach of contract, libel, trespass, conversion, assault, negligence resulting in accident, etc. Consult Burdick, F. M., 'The Law of Torts' (1905) ; Bohlen, F. H., 'Cases in the Law of Torts' (1912).

TORTICOLLIS, twisted neck, an affection in which, while the head is bent usually toward one of the shoulders, the head itself turns the chin to the opposite side. In this condition, known in various forms as stiff-neck or wryneck, lateral movement of the head often causes great pain, especially when the affection is due to rheumatism (q.v.). This attacks the muscles lying on the side of the neck, especially the sternomastoid. In the great majority of cases only one side of the neck is affected, the head being drawn more or less obliquely toward that side; but occasionally, in a form more strictly to be regarded as stiff-neck, both sides are equally attacked, in which case the head is kept stiffly erect and looking straight forward. As long as the head is allowed to remain at rest there is merely a feeling of discomfort; but every movement is apt to be extremely painful. This affection is usually caused either by exposure of the part affected to a current of cold air, or by wearing wet or damp clothes round the neck, but may also arise from spasm or strain of the muscles of the neck, causing a crick. It is usually temporary, but in some cases muscular contraction renders it perma-nent.
TORTOISE. See Box-turtle; Land-tortoise; Terrapin; Turtles.

TORTOISE PLANT, a loft climber (Testudinaria elephantipes) of southern Africa, resembling a yam, and belonging to the same family. It has slender twining stems, alternate, netted-veined leaves, small diocious bell-shaped yellowish flowers in axillary racemes, and triple-winged capsules. It is, however, characterized by its globular rootstock, sometimes four feet in diameter, and growing above the ground. This enormous tuberous structure is woody or succulent, and is covered with a soft curly bark, which, cracking by exposure, becomes tessellated with angular protuberant plates suggestive of those of the tortoise. When young it has also suggested the name of elephant's foot, and its utilization as a food by the natives has given rise to the title Hottentots-bread.

TORTOISE-SHELL, the material of the large epidermal scales of the hawksbill sea-turtle (Chelone imbricata). Thirteen of these plates cover the carapace, and of being joined together by their edges so as to make a vault. The portion of the shell posterior to the shield, and overlap each other like the tiles of a roof. They vary in size according to the part of the shell they occupy. The larger are sometimes from a foot to 18 inches long by six inches broad; the thickness rarely exceeds the eighth of an inch. The beautiful mottled color and semi-transparent characters of this material are well known. A remarkable quality is possessed by tortoise-shell which very greatly increases its usefulness for the ornamental purposes to which it is generally applied, that is, the property of being easily softened by a heat equal to boiling water, and of retaining any form when cold which has been given to it when heated. Pieces can also be welded together by the pressure of hot irons properly applied. The chief use of tortoise-shell is in making combs for the hair; but it is also used for infusing ornamental furniture and various other fancy objects. By the French chemists (roule de tortoise) it is used most effectively in combination with brass as a veneer for rich furniture, and all boule or "buhl" work consists of such a veneering combination. In India, China, and Japan many articles are made of it, showing great skill and taste.

TORTOISE-SHELL BUTTERFLY, a butterfly of the genus Tanaisa as the Camberwell beauty (q.v.), in reference to the reddish-brown, black and white coloration.

TORTOLA, tor-tö'-la, one of the Virgin Islands, West Indies, lying northeast of the island of Saint John, from which it is separated by a narrow channel; area, 24 square miles. It is hilly and rugged, the highest elevation being 1,000 feet. Only a small part of the land is cultivated, cotton and sugar are raised, and sugarcane and rum are exported. The island is, as of the most importance of the Virgin group and contains the chief town, Roadtown.

TOROJA, tor-o'ja, Spain, a city in Castile-La Mancha, southwest of Tarazona and 100 miles south of Valencia, on the Ebro River. Pop. 1,500. E. Barcar and L.A. Almansa. Much of the river. It occupies an activity rising from the left bank, forked, part of the walls being of great antiquity. There are several small squares, the streets are narrow and crooked, them very steep. The houses are built of red masonry, there is a cathedral and other and a monastery. There are the soap, paper, hats, leather, porcelain, facades, important fisheries. In the vicinity are remains of Roman ruins, also marble and a baster quarries. Pop. about 26,000.

TORTICIDE, a family of moths. ! LEAF-KILLER; MOTH.

TORTUGAS, tor-too'gas. See Dry TUGAS.

TORTURE, as a means of judicial punishment, descended to the countries of Europe from the Greeks and Romans, and was judicially inflicted either to extort a confession, purged sin, or aggravate punishment. As practised by the Greeks, it was not applied to a freedman, except in certain cases, but was commonly applied to slaves. Indeed the word torments applied to the sufferings of a slave, except under torture, and either party to controversy could demand the torture of his opponent's slaves. The principal modes of torture with the Greeks were the wheel, the sharp comb, the burning tines, the vi (into which the victim was bent double), the injection of vinegar into the nostrils. Fr. the Greeks the Romans got their system of torture and from the Roman laws it was engrained in the judicial systems of all the modern countries of Europe. The Romans, like the Greek exempted freedmen from the horrors of torture, except in cases of treason. But under emperors the torture of a freedman was not infrequent occurrence. The Romans too employed the rack, the scourge, hooks for tearing the flesh, and fire in its various uses. Contact with barbarian races gave the practice to the latter, but with one exception it was slow headway in replacing the older and superstition (q.v.). The exception is in the case of the Visigoths who established a system of torture that remained uninterrupted from the time of their se in Spain to modern times, and which is a model upon which most of the other nations were based. Localized terror came common in France during the wars of the 13th century and in Germany a century later. English lawyers assert that it was localized in Great Britain, but certain that it was commonly practised, and, if directly enjoined, was at least sanctioned by laws of that realm. All Europe came to the system during the 15th century, in the quence of the systematization of the law (q.v.), and the growth that instance (q.v.), power and importance, and with the ex of Great Britain and Sweden, torture fo recognized department of the jurisprudence. The European nations until the end of the century. During the time the law of torture was applied by the civil, not by the ecclesiastical, court, and the ecclesiastics of the question were there simply as witnesses of the confession and not as agents, as the history has pictured them. A confess
toried by torture was of no avail to the prosecu-
tion before an ecclesiastical tribunal, unless it was voluntarily confirmed three days afterward. From the 13th century on, the use of torture increased, until its extreme cruelty and the horror of its practice led to a revulsion of feeling and to its general abandonment in the latter part of the 19th century. However, it continued, to be officially recognized and sporadically employed until the early part of the 19th century. It was abolished in Saxony in 1783, in Russia in 1801, in Württem-
berg and Bavaria 1809-17, in France in 1795 (although it was employed in 1814), in Han-
over in 1819, and in Baden in 1831. It is believed, however, that it was practised in Russia even early in the 20th century. It never was sanctioned in the United States, though "witches" were burnt near Salem, and the burn-
ing of negroes for rape by lynch law still persists. Consult Lea, H. C., 'Superstition and Force' (1870); Pearsall, R. L., 'The Kiss of the Virgin,' etc., (1898); Sassen, M. J., 'Dis-
putatio de abusu usu torturae' (1697); Parsons, 'Studies in Church History' (Vol. II, Art. "Inquisition," 1895). See INQUISITION; RACK.

TORU DUTT, tōˈru doot. See Dutt, Toru.

TORY, Henry Marshall, Canadian min-
ister and educator: b. Guysboro, Nova Scotia, 1867. He was educated at the local academy and at McGill University where he was gradu-
ated in 1890 with high honors in mathematics and physics. He studied theology at Wesleyan University and entered the Methodist Church in 1890 but retired in 1892 to become lecturer in mathematics at McGill University and was pro-
fessor there until 1908 when he was chosen president of the Provincial University of Alberta at Strathcona. He published 'A Manual of Laboratory Physics' (1902).

TORY, the name of a political party, used in Great Britain and other Anglo-Saxon coun-
tries, is said to have originally been applied to the Roman Catholic outlaws who lived in the bogs of Ireland during the reign of Charles II. The name became identified with the opponents of the Duke of York from the English succession (1679), and was thus in-
tended to imply Roman Catholic sympathies on the part of the duke's adherents. It was trans-
ferrred to the court party in English politics, their opponents being classed as Whigs. Since the clergy of the Church of England had the doctrines of passive obedience and the divine right of kings, they also were known under the name of Tories. In modern English politics the successors of the Tory party are known as Con-
servatives, but the old term is not infrequently heard in Parliamentary debate. Political parties in British colonies at times followed closely the divisions and names in England, so that in Australia and New Zealand the conservative elements in the representative assemblies were known as Tories. In the American colonies the name was given to the adherents to the policy of the mother country, and during the Revolu-
tionary War was applied to all persons sus-

TOSCANELLI DAL POZO, Paolo, tōsˈka-nəlˈle dàl pöˈso, Italian geographer: b. Florence, Italy, 1397; d. there, 1482. He be-
lieved that India could be reached by sailing to the westward and so advised Columbus 1474. He also gave the king of Portugal similar views. It is thought that he strengthened the views of the great navigator to undertake the western voyage, although not alone in doing this. Consult in some country, 'Toscanelli and Columbus' (New York 1902).

TOSTI, Sir Francesco Paolo, frānˈchēzˈkō pāˈlo tosˈte, Italian composer: b. Ortona di Mare, 7 April 1847; d. 1916. He was a pupil and later teacher at the Conservatorio Reale, Naples, and in 1869 appeared as a concert singer at Rome. Shortly afterward he became vocal instructor at the court; removed to London in 1875 and in 1880 was appointed in-
structor to the royal family. He produced 'The Grand Duke' (opera, 1888); 'La prima donna' (opera, 1889) and many English and Italian songs. His 'Good-bye'; 'For Ever and For Ever'; 'That Day,' etc., are widely popu-
lar. He was knighted in 1908.

TOSTIG (TOSTI, TOSTINUS), West-
Saxon warrior: d. 1066. In 1055 he was made earl of Northumbria, Northumberland and Huntingdonshire, by Edward the Confessor. A stern ruler, he repressed feud and disorder by the exercise of a merciless justice (patriam pur-
gando italiam cruciata vel necte), with no dis-
inction of rank. In 1063 he joined his brother Harold in the invasion of Wales, but in 1064, for treacherous murder, was outlawed, while Morcar was chosen to the earldom (1065). He retired into exile in Flanders, in 1066 committed various depredations on the Isle of Wight, Lindsey and the east coast and subsequently joined Harold Hardrada, king of Norway, in an invasion of England. They landed in York-
shire, but were entirely overthrown by Harold and his household troops at Stamford Bridge. Tostig figures in Tennyson's drama of 'Harold' (1877). Consult Green, 'The Conquest of Eng-
land' (1884); Freeman, 'History of the Nor-
man Conquest' (Oxford 1887).

TOTARA, or TOTARRA, a tree (Podo-
carpus totara) of New Zealand, of the yew
family, excelled only by the kauri for general utility, and most abundant in the forest of North Island. It is from 60 to 80 feet in height and has a fibrous brown bark which is deeply furrowed and was used by the natives for roofing their huts. Its leaves are linear and of a greenish-brown color. The wood is red-
dish-brown, clear and straight in the grain and does not warp or twist. It is largely used for furniture, cabinet-work and house-building, but is particularly valuable for bridges, wharves and marine pilings, as it is durable under ground or water and resists the attacks of teredos for a long time. The aborigines made canoes from the trunks of these trees. See PODOCARPS.

TOTEM, a word which appears to have been applied originally to the animal or other thing held sacred by certain tribes as the sign or symbol of the tribe or of an in-
dividual Indian. The superstition is not con-
fined to American Indians and has its counter-
part in the symbols of civilized nations. The American eagle, the lion of Britain, the thistle of Scotland, the rose of England, etc., and the arms of noble families are illustrations.
The practice can be traced, indeed, throughout all history, among the greatest empires and the most savage tribes.

The totem superstition varies in its features in different countries. The members of the Emu clan of an Australian tribe believe themselves descended from the Emu and are regarded as forming a kind of blood-group in virtue of their common descent. No member is permitted to marry within the clan, and all the members are bound to support one another in any unforeseen misfortune. No Emu clan member will knowingly kill or eat an Emu. Among some savage peoples the dead totem is elaborately mourned and carefully buried. Besides clan totems there are sex totems and individual totems. The totem having an important bearing on a person's relations to his fellows, it is shown conspicuously, being often tattooed on the skin or otherwise. The importance of totemism in relation to the social and religious institutions of savage peoples was first pointed out by Sir Edward Youde, though it had been observed by subsequent investigators but no satisfactory explanation of this curious system has yet been advanced. The American Indians were given to totemism and not only set up various clan totem figures as emblematic of their tribes but individuals were frequently named after animals. The exact meaning and character of their totem practices is little understood. There were rules as to all marriages of those in kindred totems; some took their totems from their fathers, some from their mothers and some from their tribe. Totemism exists also among many African peoples, and numerous instances of it are to be met with in Asia and Polynesia. (See Africa; Australia; Indians; Americans). Consult Lang, A., 'The Secret of the Totem' (1905); Frazer, 'Totemism' (1887); Durkheim, E., 'Elementary Forms of the Religious Life' (Eng. trans., London 1915).

**TOTEM POLE.** A pole used among North American Indians to exhibit the totem figures. The totem pole is composed principally of three half human, half animal figures, seated above one another and holding erect a pole on the summit of which, for instance, is the totem. See Totem.

**TOTENICAPAM, tō-tō-nē-kā-pām.** Guatemala, the capital of the department of the same name, situated 60 miles northwest of the city of Guatemala. It manufactures cloth, pottery and wooden implements. It was half destroyed by an earthquake in 1902. The population, consisting almost entirely of Quech Indian, is about 28,000.

**TOTEL, Richard.** English printer and publisher; b. about 1525; d. 1594. He was granted a patent in 1553 to print law books, which was extended for life in 1559. He also published the works of the men of his day. He has no various animal figures as emblematic of the various totemic clans. Among his other publications were the translation of 'De Officiis' by Grimaldi (1556) and the translation of the second and fourth books of the 'Aeneid' by Surrey (1557).

**TOTEL'S MISCELLANY.** The work which commonly goes by this name was published under the title 'Sones & Sonete written by the ryght honorable Lorde Henry Haward [i.e., Howard] late Earle of Surrey, and other,' by the stationer Richard Tottel. On 3 June 1557 the population of the second edition was issued in the following month and six others followed within the century. Tottel's method, too, was imitated by other editors and publishers and doubtless stimulated the vogue of verse in popular called the Elizabethan anthologies. In the address of 'the Printer to the Reader,' he alludes to the verse of well-known Latin and Italian poets, adding: 'That our song is able in that kynde to do as praiseworthy as the rest, the honorable stile of the noble earle of Surrey, and the weigthinesse of the depe-witted sir Thomas Wyat the elders verse, with several grace in sondry good Englishe writers, doe show abundantly.' This passage indicates the purpose of the volume: namely, the effort which it represents to beautify English poetry and to show that the art of the Italians could be rivalled by the new courtly or cultivated school of British poets. Compare, for instance, the version of a work called 'The Arte of English Poesie' (1589), attributed to one George Puttenham: 'In the latter end of the same kings raigne [i.e., Henry VIII] sprung up a new company of courtly makers, of whom sir Thomas Wyat the elder and Henry Earle of Surrey were the two chieftains, who having traviled into Italie, and there tasted the sweete and stately measures and stile of the Italian Poesie, as novices newly crept out of the schools of Dante, Arioste and Petarch, they greatly polished our rude and homely maner of vulgar Poesie, from that it had bene before, and for that cause may justly be sayd the first reformers of our English metre and stile.'

Wyatt had died in 1542 and Surrey in 1547, but it was reserved for the publisher Tottel to secure manuscript copies of many of their poems and bring them out for the first time in print. These occupy the place of honor in the volume, being followed by the works of Richard Sibyls, Nicholas Grimaldi (who has been suspected of acting as Tottel's editor) and by those referred to 'Uncertain Authors.' A number of the poems in this last group can be identified, one of them, indeed, being a now familiar lyric of Chaucer's, but the majority remain anonymous, nor is any of these comparable to the best work of Wyatt and Surrey. The elements of familiarity and of novelty in the collection are perhaps best illustrated by the metrical form of the various poems. One finds, for example, the old 'rhyme royal' stanza of Chaucer, and the loose, sometimes doggerel 'septenary,' or seven-foot line, which had been popular from the Middle English period; but side by side with these occur the stanzas of the 'Statius' company which he left in 1589 because of poor health. His most notable work was done in compiling and publishing the first poetic anthology in England, 'Tottel's Miscellany' (1557), which contained 45 anonymous animal figures as emblematic of the various totemic clans. Among his other publications were the translation of 'De Officiis' by Grimaldi (1556) and the translation of the second and fourth books of the 'Aeneid' by Surrey (1557).
sulting type of sonnet, in three quatrains and a
couplet, which was to be the favorite in the
Elizabethan age and the form chosen by Shake-
speare. Outside the work of these two poets,
the sonnet was of slight intrinsic value; but its historical importance is so
marked that because of its publication in
1557 it is customary to date from that year
the beginnings of modern English poetry.

The convenient modern edition of Tottel's
Miscellany is that in Arber's 'English Reprints'.'
For accounts of the poetry of Wyatt and
Surrey consult Courthope's 'History of English
Poetry' and Padelford's 'Early 16th Century
Lyrics' (Belles Lettres Series).  

RAYMOND M. ALDEN.

TOTTEN, tö’tén, Charles Adiel Lewis,
American inventor and military instructor: b. New London, Conn., 3 Feb. 1851; d. Milford,
Conn., 12 April 1908. He was graduated at
West Point in 1873 and was instructor in mili-
tary science and tactics at the Amherst Agri-
cultural College, at the Cathedral School, Saint
Paul, Minn., and at Yale University. He
patented improvements in high explosives,
in collimating sights and in signal-shells; besides
a system of weights and measures and improve-
ments in linear and other scales. He patented
a war game which he described in a publication
entitled 'Strategos, the American War Game'
(1880) and has also published 'Important
Questions in Metrology' (1883). More recently
he issued 'Lost Israel Found in the Anglo-
Saxons' (1890) and 'Joshua's Long Day and
the Dial of Ahaz' (1891).

TOTTEN, Joseph Gilbert, American mili-
1785; d. Washington, D. C., 22 April 1864. He
was graduated from West Point in 1805, was
engaged in a survey of Ohio and the western
territories, and in 1806 resigned from the army.
He re-entered the army in 1808, was reappointed
second lieutenant of engineers and was in the
events of the War of 1812 at Fort William
and Fort Clinton in New York Harbor until
1812. He was chief engineer in the army on the
Niagara frontier during the War of 1812, was
brevetted lieutenant-colonel in 1814, and after
the death of Major-General Totten, was con-
sulted by Captain William H. Smith as to the
coast defenses until 1838 when he was pro-
moted lieutenant-colonel and chief engineer in
the army, and shortly afterward became su-
pervisor and inspector of the United States
Military Academy. At the outbreak of the
Mexican War he was placed in charge of the
engineering operations and in recognition of
his services in planning the siege of Vera Cruz was
brevetted brigadier-general in 1847. He then
resigned from the army, but was ap-
pointed one of the commissioners for arranging
the terms of capitulation. He became brigadier-
general in 1863 and in 1864 was brevetted
major-general. He published 'Essays on Hy-
draulics and Other Currents' (1842).

TOTTENHAM, tö’tën-nam, England, a town
of Middlesex, forming a residential suburb of
London and situated some six miles north of
the Tower of London, just outside of the city
limits. It was a favorite resort of Isaak Walton.
Among its most interesting buildings are the
old church, engaged by the construction of Eliza-
bethan mansion formerly owned by Robert Bruce.
Pop. 150,000.

TOTTENVILLE, formerly an incorpor-
ated village in Richmond County, N. Y.; since
1898 in New York City. See STATEN ISLAND.

TOTUAVA. See BLUEFISH.

TOUCAN, too-kân or too'kân, a family
(Ramphastidae) of coccycgymorphous birds
somewhat resembling the hornbills, distinguished by the great development of the bill,
which is curved superiorly and bears a promi-
nent keel, with cutting edges frequently toothed.
The outer walls of the bill are extremely thin,
its interior is hollowed out into air-cells, and it
is thus rendered comparatively light. The
long tongue is slender and barbed along the sides.
The toes are paired, two forward, two back-
ward and the tarsi scutellated, the wings rather
short and the tail long, with 10 quills. The
toucans are confined to tropical America, where
about five genera and 60 species occur. They
are birds of brilliant and striking plumage, and
the bill and naked skin about the eyes partake
of this brightness of hue. Most of the species
are gregarious, spending most of their time in
hopping actively about among the treetops and
seldom flying far. The times of their greatest
activity are the morning and evening, when the
woodlands are filled with their loud harsh cries.
While fruits are their chief food, insects and
the eggs and young of birds are also eaten. They
have a characteristic manner of throwing back
the head and bolting their food. When
sleeping the head and tail are turned toward
each other and rest on the back. All of the
species, so far as known, nest in holes in trees,
the birds sometimes excavating a suitable place
in a decayed stub. Only two white eggs are
deposited.

The following are some examples of the
species, many of which are familiar in the col-
lections of zoological gardens. The toco toucan
(Ramphastos toco) is black with a black and
orange bill, blue circumocular areas and white
throat and rump. It is nearly two feet long
and inhabits Argentina and is distinguished by
the rufous underparts and the white head.

TOUCAN. See ELIZABETHAN;

TOUCHEY, tow'sî, Isaac, American jurist:
b. Newtown, Conn., 5 Nov. 1796; d. Hartford,
Conn., 30 July 1869. He received a private clas-
sical education, was admitted to the bar in 1818,
and established a law practice at Hartford.
He was State's attorney for Hartford County in
1822-25, served in Congress in 1835-39 and was
again State's attorney in 1842-44. He was
governor of Connecticut in 1846-47, and in
1848-49 was United States Attorney-General.
In 1850 he was elected to the State senate
and in 1855 was elected to the U. S. Senate.
He was appointed Secretary of the Navy by
President Buchanan in 1857 and served until
1861. His conduct of naval affairs was severely criticized. He was accused of favoring the secession cause by scattering the best ships of the navy in distant seas. The charge was denied, and he continued to be regarded as a sympathizer with the South.

TOUCH, the sense of feeling. See SENSES.

TOUCHSTONE, LYDIAN STONE, or BASANITE, a velvet-black jasper, used on account of its hardness and the uniformity of its texture and color as a streak tablet for determining the relative amounts of baser metal and pure gold in alloys. The sample is rubbed on the stone and the color is then compared with a series of standards of known composition. The expert is able quite accurately to determine the fineness of the sample, the streak becoming redder as the proportion of copper increases, or yellower as the percentage of gold increases. This method of testing has been in vogue from the earliest times, the name Lydian Stone appearing as long ago as 450 B.C. Modern methods of assay have now largely superseded the use of this stone.

TOULON, too-lon, France, a fortified seaport, naval arsenal, in the department of the Var, on the Mediterranean, 42 miles southeast of Marseilles. The port is separated from the roadstead by bomb-proof mole and comprises two parts: one, including the merchant shipping; the other, the dockyard, slip, arsenal, foundry, etc. The fortifications are very complete. The cathedral was founded in 1096. This, the hôtel-de-ville and a capacious theatre are the chief of the old buildings; more recent are the Musée Bibliothèque, Marine School, literary and scientific societies, and the aquarium and botanical gardens. The Place de la Liberté contains a splendid monument to the heroes of the Revolution; Le Place d'Armes, the Boulevard Strasbourg and Jardin de la Ville are prominent promenades. It has modern fortifications of the first class and is headquarters for one of the five maritime arrondissements carrying stores for the Mediterranean fleet, with important shipbuilding interests. The bay or harbor is defended by torpedoes and gunboats. On the hills north of the city, in the heart of the hills, is the famous fortress of Montalembert. In the 17th century, Louis XIV gave Toulon its importance as a naval station, making the dockyards and arsenal the finest of France. Toulon became famous as a stronghold in the 16th century. Here the English were defeated by the fleets of France and Spain (1574); and in 1793 Napoleon forced the English and Spaniards to evacuate the position—his first memorable victory, while commanding the French Republicans. In time of peace about 600,000 tonnage is entered and cleared annually. The principal trade is in wines, fruits and oils. There are metal factories and lace works. Pop. about 107,000.

TOULMIN, Henry, American lawyer: b. Taunton, England, 1767; d. in Washington County, Ala., 11 Nov., 1823. He came to Norfolk, Va., in 1793 and in 1794–96 was president of Transylvania University. He was appointed circuit judge of the state of Kentucky and in the latter year was appointed judge of the United States District Court of Mississippi. He assisted in framing the constitution of the State of Alabama, in whose legislature he served. He was author of "A Description of Kentucky" (1792); "A Collection of the Acts of Kentucky" (1802); "Review of the Criminal Law of Kentucky" (1804); "Digest of the Laws of Alabama" (1823).

TOULOUSE, Clé-ooz, France, capital of the department of Haute-Garonne, 140 miles southeast of Bordeaux, on the Garonne. It is the centre of railway traffic and river and canal freight in southern France. A fine bridge connects the town with the village of Saint-Cyprien. It is a quaint old town, but very enterprising. The most remarkable buildings are the cathedral, church of Saint Sernin, Hôtel de Ville, museum and Palais de Justice. The museum contains an almost unparalleled collection of objects d'arts from the Gallo-Roman to the Renaissance period. There are several fine academies of art, science and literature (one claiming its origin to have been in games of the troubadours of 1323), namely, Société des Jeux Floraux; professional and technical schools, a large public library, a writer of rare volumes, an observatory and botanical gardens. Toulouse is one of the larger cities of France, designated as the seat of a State university, which includes faculties of law, medicine, science, letters, etc. It has a library of over 150,000 volumes and nearly 5,000 students. There is also a large Catholic institution with theological, literary and scientific instruction. The name of the city was Tolosa, dating back before the Christian era, and is in English, Toulouse, from which Toulouse is in Latin, Tolosa, from which Toulouse is in French. The Visigoths, under King Wallia, made it their capital in 419. It was taken by Clovis in 507, and was Charlemagne's capital in 630. For many hundred years it was the foremost city of southern Gaul. The Saracens took it in 718. The name developed into Toulouse about 780, when Charlemagne made his young son Louis king of Aquitaine, with his capital there. About 850, the first Count of Toulouse established himself, and these nobles governed the city and southern France for over 500 years. The tribunal of the Inquisition was established at Toulouse. It was the scene of Huguenot massacres in 1562 and again in 1572. The manufactures include textiles, leather, camel, steam-engines, tobacco, brandy, etc. In modern history, the most important event was its defeat by the English, while in ignorance of Napoleon's abdication. Pop. (1911) of commune 149,570, the town proper being about 23,000 less.

TOULOUSE, University of, celebrated French school of higher learning, founded by
TOLOUSE GOOSE—TOURMALINE 719

Gregory IX in 1230 as a protest against Ilghesan heresy. It was originally a gical school but became noted as a school w and sided with royalty against the h. At the time the laws of the church and the national system it now includes only faculties of law, medicine and pharmacy, science and philosophy. There also is the y of Protestant theology of Montaup and y two free faculties of theology and a phy. Its library is noted and contains erably over 150,000 volumes.

TOLOUSE GOOSE. See Geese.

UMEY, James William, American pro- of forestry: b. Lawrence, Mich., 17 1865. He was educated at the Michigan illar Colleg in 1889, and was special at Harvard in 1893. He was assistant department of botany in the Michigan illar Colleg (1890–91), professor of y in the University of Arizona (1891–98), national forester of the United States Forestry and became director of the Yale School in 1910. He is the author of 1 books on forestry and kindred subjects.

OUR, Maurice Quenti de la, m-rès p de la toor, French painter: b. Saint in, 5 Sept. 1704; d. there, 18 Feb. 1788. He his art studies in his native town and devoted himself to the execution ets portraits in Paris, in which city he i such reputation that the most famous of contemporaries gave sittings to him. He e was elected to the Académie. He re- l to his native town in 1784 and the Saint and Museum now contains 80 portrait s of his. His 'Pompodor' is in the e; and there are two other of his pic- in the Dresden Gallery. Consult Patoux, yve de M. Quintin de la Tour au Musée int Quintin' (1886).

OURACO, a large and beautiful A of the genus Corythis; with a short, small, high bill; both mandibles notched serrated; short, rounded wings, with ree first quill graduated; a long rounded st, short feet and an erectile crest. Prevailing color is green, with purple on ng and the tail, the peculiar red of which tished by a special pigment called turacin. Feed on fruits, perch on the highest es of trees. It is a member of the family ant-caters (q.v.). Consult Newton, orny of Birds (New York 1896).

OURAINE, too-ran, a former province fuchy of France, bounded by Maine, anis, Berry, Poitou and Anjou. Its l was Tours. It now forms the depart- of Indre-et-Loire. It was anciently d by the Gallic tribe of Turones.

OURCOING, too-kwan, France, a town department of the Nord, nine miles ast of Lille. Before the war it was a uilt and prosperous manufacturing town mostly cloth, flax, hemp and shoe. It also a one hotel-de-ville in Renaissance style. I improved rapidly in a commercial sense. The staple manufactures are textiles of all especially woolen goods, velvet carpets ugs, cotton goods, and cloth. It was also a center of the woolen industry. The chief imports were wool, flax, yarn and hemp, and the exports combed wool, yarn, tissues, rags and flax. It was captured by the Germans in 1914, and sadly wrecked during the Great War. The population in 1911 was 82,000.

TOURGEE, toor-zhà', Albion Winegar, American jurist and author: b. Williamsfield, Ashatabula County, Ohio, 2 May 1838; d. Borde- daux, France, 21 May 1905. He was graduated at the University of Rochester (N. Y.), enlisted May 1861 as a private in the New York volunteers, was wounded at the first battle of Bull Run, and having been discharged, studied law and was admitted to the bar at Painesville, Ohio. In 1862 he re-entered the military service as first lieutenant in the 165th Ohio, in 1864 resigned, and in 1865 began professional practice at Greensboro, N. C. He was a delegate to the Southern Loyalist convention at Philadelphia in 1866, and at the constitutional convention of North Carolina, where he drafted the article on education. From 1868 to 1874 he was judge of the Superior Court of the State. During his term of office the Ku Klux Klan was exposed and largely broken up, and his services to this end were very efficient. The sworn statements of several members received by him were later utilized in a series of fictional works dealing with Reconstruction times in the South, of which 'A Fool's Errand!' (1879) was the best known. Contemporary interest in these books was great, and their sales were very large for those days. Tourgee was made consul at Bordeaux in 1897, consul-general at Halifax in 1903, and from then until his death was again consul at Bor- daux. He was editor of The Continent (1882–84); 5 vols., an illustrated weekly published in New York (Vol. III in Philadelphia), and also wrote a few law books. Among his other works were 'Bricks without Straw' (1880); 'John Eax' (1882); 'An Appeal to Caesar' (1884); 'Button's Inn' (1887); 'With Gauge and Swallow' (1889); 'Murvale Eastman' (1890); 'Out of the Sunset Sea' (1892), and 'The Mortgage on the Hipoof House' (1896).

TOURJEE, Eben, American musical con- ductor: b. Warwick, R. I., 1 June 1834; d. Boston, Mass., 12 April 1891. He studied at the Academy at East Greenwich, Rhode Island, and opened a small music store in Fall River, Mass. Later he turned to music-teaching, both privately and in the public schools. After a period of study in Europe he opened a conservatory at Providence in 1864. This institution was moved to Boston in 1867 and became the New England Conservatory of Music which has grown to be the most important music institution of the kind in America. In 1872, when the College of Music of Boston University was founded, he became its dean. He was the organizer of several large choruses, notably that assembled for the Peace Jubilee in 1869, and another of nearly 20,000 singers for the World's Peace Jubilee in 1874.

TOURMALINE, a common and widely distributed mineral, so named from an East Indian name, and known to earlier writers as schor. It is a very complex aluminum boro-silicate, with several marked varieties depending on the presence and proportions of other metallic oxides. The precise constitution of tourmaline has been recently studied elaborately by eminent
mineralogical chemists both in Europe and America, without exact agreement, save in its general features, as derived from a complicated beryl, or other acid. As regards to the acids present, three types are clearly determined,—iron tourmalines, mostly black; magnesia tourmalines, usually brown; and alkali tourmalines, in which some lithia is present, of red, green and other rich colors. These last, when transparent, yield beautiful gems, of a hardness of seven to seven and five-tenths and specific gravity three to three and one-tenth. The black variety is quite common in schists, gneisises and granites; the green, Brazilian emerald; the deep blue, indicolite, or Brazil; the colorless, achatite. The crystals are rhombohedral, hemimorphic and of prismatic habit, either short and stout or long and slender, with three, six, nine or 12 sides, and with hemihedral, or more rarely, simple habit tendencies. The prisms are often so deeply striated vertically as to completely obliterate the faces. The physical properties of tourmaline are very interesting; it is rendered highly electric, both by heating and by friction and it has remarkable polarizing action on light; so that plates cut from transparent crystals, parallel to their length, are much used in experiments in optics, mounted in the so-called tourmaline pincers. With this is connected a very high dichroism, such that the color is frequently quite different according as light traverses a crystal lengthwise or across. Entirely distinct from this is another peculiar feature, namely, the intermixture of two or more colors in the same crystals, either transversely (concentrically) or lengthwise, sometimes gradually and sometimes sharply; so much so that elegant gems have lately been cut from some of the crystals from Southern California which are half red and half green, with perfectly sharp demarcation between the two brilliant tints. The most noted localities for bright-colored tourmalines are the Ural Mountains; the island of Elba; Brazil; Paris, Me.; Hadham Neck, Conn.; and above all, several mines recently opened in San Diego and Riverside counties, Cal. (See Gems). Superb black tourmalines occur at Pierrepoint, N. Y.; fine brown crystals at Gouverneur, N. Y., and Hamburg, N. J.

TOURNACHON, Felix, French author and aeronaut; b Paris, 1820; d. there, 1910. He was educated in Lyon, studied medicine but returned to Paris and founded the Revue Comique in 1839 and in 1854 published the Panthéon-Nadar, both which brought him renown. His experiments in aerial navigation led him to construct a huge balloon, Le Gant, with which he made various ascensions. At the siege of Paris, he was invaluable as a carrier of information and commanded the company of aeronauts. He was the author of a number of publications including 'Les ballons en 1870' (1871) and 'Le Manège d'Oléron' (1883).

TOURNAI, tour-nä, Belgium, a town in the province of Hainault, on the Scheldt, 50 miles southwest of Brussels near the French border, 15 miles east of Lille. It is the seat of a bishop, has pleasant suburbs, fine quays and streets. Its ancient Romanesque cathedral has five towers and contains pictures by Rubens. Other churches are St. James, St. Brice and Saint Jacob, besides the belfry with its wonderful chimes. Other prominent features are a picture-gallery, a library of 60,000 volumes, an episcopal seminary, five hospitals, an asylum, museum of natural history, civic hall and theatre and a bronze statue of Princess d'Espagney, marble bust of Dumortier and many medieval buildings. The industries embrace the manufacture of woolen goods, hosiery, valuable carpets, linen, ribbon, faience, soap and candles, much of which is handwork. Tournai was in the 5th century the seat of the Merovingian kings, then belonged to France, but later was incorporated in the Spanish Netherlands. It lies near the scene of many battles in 1503, 1567, 1709, 1745 during which years it belonged to France, and in 1914, when it was devastated by the German invasion. Pop. 37,349.

TOURNAMENT, a friendly contest at arms among warriors of noble birth during the Middle Ages. The use of the term was not fixed and it denotes the gathering of the nobles and knights, the contests and the fetes or carousals which followed. A tournament often lasted several days, a week or two, and during this time the lords and knights would gather at the town in which it was to be held, with their servants and esquires, and each would establish quarters which would be made gay with flags and pennants and would erect his arms or insignia. Meantime there would be prepared the lists, the place where the contests were to be held; this consisted of a rectangular space of large dimensions, fenced in by rows of a railing and surrounded by galleries erected for the ladies and spectators of honor. Certain qualifications of birth were necessary for admission to the contests and each lord or knight had for sponsor some lady whose champion he claimed to be and whose colors he wore. The knights were attended by their squires who furnished them with arms, raised them if disinmounted, etc. The weapons used in the contests were lances with the point covered with the sword with point and edge dulled and decorated with clubs of wood. The knights wore armor which was heavy or light according to the customs of the section in which the contests took place; the latter were held under very exact rules and under the constant supervision of judges and governors. In some of the tourneys it was not allowed the contestant to dismount; he was to run so many courses with the lance or strike so many blows with the sword or mace, and the successful knights received prizes delivered by some lady who had been selected the queen of beauty. On the second day there was often a tourney for the esquires and perhaps on the third day there would be a general mêlée of knights or squares or even a small mock battle in the lists.

Such were the tournaments of the later part of the Middle Ages. Their origin is obscure and they seem to have passed through a period in which they were contests in dress, combat and never a friendly contest for sport. It is thought they arose out of the old trials by ordeal (q.v.) and that at first they partook of a judicial nature. Certain it is that at first
were far more deadly than in later years for they were not uncommonly fought with weapons of war. Jousts of two kinds—the joute à outrance or combat, usually fought between two men of different nations and the à plaisir, the joust of peace which took place at the end of a tournament but which seems often to have been a staged contest in the nature of a duel, while jousts still retained the aspect of le combat to decide some question of ance, they lost their vicious nature and was rarely spilled. The passage of arms favorite practice of roving knights, a of whom would assemble at some place spend, each, several shields of different offering combat to any knight who ted himself. The accepier of the cha-struck the shield of the knight whom led to engage and the color and variety set for in a contest, had much to do with hastening dition, but it is probable that the change modes of warfare and the critical temper ed by the revival of learning were the causes of their abandonment. ord tournaments survive in modern con chess and checker play, tennis and other. The contests are entered, often classi to their ability and paired off for indi play until every player has met every player in the tournament. The one with thist percentage of wins is then declared tor and receives the first prize. Consult Gau thier's 'La Chevalerie'; Hallam's le Ages' and Viiolet-le-Duc's 'Diction du Figalier.'

TOURNIQUET, a contrivance for com a blood-vessel to stop the flow of blood putations and in dangerous hemorrhage wounds and to control the circulation a aneurism. It is believed to have rst used in France by Morel (1674). As this surgeon in amputations of limbs, ized of a stick passed beneath a bandage rised so that the tight knot would exert il pressure on the principal bleeding ves e rest of the bandage compressing the vessels of the limb sufficiently. At the time such a tourniquet is known as an ey tourniquet, which may also consist thing tied around the part above the in case of arterial hemorrhage (below, of venous hemorrhage) and twisted by of the tight knot is increased by placing a pad over air artery. Compression of a bleeding with the thumb or finner is of service a tourniquet cannot be obtained. Tourni quet of brass or copper, patented in from their inventors. Du Puyn's set consists of a semi-circular piece of with a head at one end and is used to s the abdominal aorta; Esmarsh's con

TOURNIQUET—TOURS 721

sists of a piece of flat rubber tubing to be wound about the upper part of a limb, after the the blood has been driven out of the limb by elastic bandage or to be used by itself in compression of the iliac arteries, the abdominal aorta, etc. The field tourniquet, resembling Petit's spiral tourniquet, is a padded strap to be buckled on and pressed by a screw upon an artery. With the horseshoe tourniquet, named from its shape, pressure is exerted at two points. The provisional tourniquet is one applied loosely, to be tightened in case of necessity.

TOURO, too-ro', Judah, American philanthropist: b. Newport, R. I., 16 June 1775; d. New Orleans, La., 18 Jan. 1854. He was the son of Rev. Isaac Touro, who in 1762 was chosen rabbi of the Jewish congregation of Newport, R. I. The son removed to Boston, Mass., where he engaged in business with his uncle, Moses Hays, in whose employ he sailed to the Mediterranean in 1798 as supercargo. In 1802 he settled in New Orleans, where he became a wealthy merchant. He displayed his patriotism in the War of 1812 by furnishing the arms of the volunteer in General Jackson's army and was severely wounded at the battle of New Orleans. The range of his benevolence was very broad; families and individuals, churches and synagogues alike were enriched by him. Toward the erection of the Bunker Hill Monument he gave $10,000.

TOURS, toor, Berthold, Dutch composer: b. Rotterdam, Holland, 17 Dec. 1838; d. London, 11 March 1897. He studied at Leipzig and Brussels and going to London in 1861 became musical editor to Novello, Ewer and Company, 1878. His productions were principally religious in character and his 'Service in F,' 'Blessing, Glory, Wisdom and Thanks' and 'O Saving Victim,' were especially favorites. As a church composer he represented, with Stainer and Barnby, a new phase of English Church music which comprehends the introduction of new dramatic and melodic elements for which the entire school is probably indebted to M. Gounod.

TOURS, France, capital of the department of Indre-et-Loire, on the left bank of the Loire, at the confluence of the Cher, 130 miles southwest of Paris. The principal entrance to the city is by a magnificent bridge across the Loire, 1,423 feet long. The banks of the river are enclosed by a quay, lined with handsome houses and finely-plantcd promenades. Great part of the town is new and many of the streets are spacious and elegant; but the older quarters are inferior. The principal edifice is the cathedral. Its west front consists of three lofty, flamboyant portals surmounted by a window of astonishing dimensions and flanked by two domed towers, 205 feet high. The interior, of the purest Gothic, and lighted by beautifully stained glass, is 256 feet high in height. Two towers form conspicuous objects from every part of the town; one called the tower of Saint Martin or Horloge, from containing the principal clock; the other the tower of Charlemagne, or Eschard, was buried below it, and both remarkable as the only relics which the Revolution of 1793 have left of the vast cathedral of Saint Martin of Tours, after it had flourished for

VOL. 26—46
12 centuries. The archiepiscopal palace is regarded as one of the most handsome in the kingdom. It is the seat of a college, has other excellent educational institutions and a library of 175,000 volumes. The manufactures consist of silk stuffs, ribbons, cloth, serge, rugs, chemicals and leather, besides steel and ironworks and pottery, and the trade is in corn, wine, brandy, dried fruits, wax, hemp, wool, etc. Tours early acquired considerable importance and under the Romans was known by the name of Caesarodunum. It was from the gates of Tours that Charles Martel (q.v.) drove back the Moslem invasion of Europe in 732. In modern times it became famous for its silk manufactures and had so extended as to have a population of 80,000, when the Revocation of the Edict of Nantes deprived it of nearly half its inhabitants and almost all its industry and inflicted a blow on its prosperity from which it has scarcely recovered. During the Franco-German War Tours was made the seat of the government of France by Napoleon III on 12 Sept. 1870. The delegation removed to Bordeaux on 10 December. Tours surrendered to the Germans 21 Dec. 1870. Pop. 73,398.

TOURVILLE, too-voil, Anne Hilarion de Cotentin, Count de, French naval officer: b. 1610, at la Motte-Neuf, in Meulan, 24 Nov. 1642; d. Paris, 28 May 1701. He entered the navy in 1660, became a captain in 1667, participated in the battle of Agosta in 1670, and in command of the vanguard at the battle of Palermo in 1677 he destroyed 12 of the enemy's ships. He was appointed lieutenant-general of marine in 1680, commanded several expeditions against the North African pirates in 1682-88, became vice-admiral in 1689 and in 1690 was in command of the fleet which supported James II of England. He defeated a Dutch-English fleet off the Isle of Wight in that year, but in 1692 was ordered to attack a superior fleet off Cape La Hogue, in order to facilitate the landing of the Jacobites, and was defeated. He was created marshal of France in 1693 and in that year he captured and destroyed a Dutch-English fleet off Cape Saint Vincent. At the outbreak of the War of the Spanish Succession he was appointed commander-in-chief of the combined naval forces of France and Spain, but died shortly after.

TOUSSAINT, Anne Louise Gertrude, Dutch novelist: b. Alkmaar, 1812; d. 1886. She lived at The Hague after her marriage to the architectural painter, Jan Bosboom, in 1851 and became noted for her novels, especially her historical works. He "Het Huis Lauermesse" (1841; 10th ed., 1885) was translated into several languages and her "Leie-ster" trilogy became famous. Her works were collected in 25 volumes. Collectif Ten Bank, Jan, "Life of Anne Louise Gertruida Tou-sant" (Amsterdam 1886).

TOUSSAINT, too-sant, Francois Dominique, called L'Ouvriére, too-vair-teur, Haitian soldier and liberator: b. 1743; d. Port de Jacq, near Jacmel, Haiti, 27 April 1803. He was the first Haitian to fight against France when the insurrection of the blacks broke out in 1791 Toussaint took service in their army, but not till he had assisted his master to escape. He rose quickly in the army, being made in 1795 a general of brigade. In this position he displayed much military as well as political ability and rendered valuable services to the French republic against the British troops which had been landed on the island. In 1797 the French government made him general of division and subsequently general-in-chief of the troops in Santo Domingo, in which post he signed the convention with General Maitland for the evacuation of the island by the British. He now assumed sovereign authority, but it was only after severe struggles against insurrections that he was able firmly to establish his position. In 1800, on the submission of the Spanish forts, he was completely master of the island. He now framed a constitution by which he was appointed president for life of the republic of Haiti, with the right to name his successor. He was simple and abstemious in his own habits, but affected great magnificence in his surroundings and exacted a rigorous court etiquette. His character has been highly lauded by his admirers by Vanbeeck, the son of Anastasius, who made him the subject of one of his lectures. He ruled with wisdom and justice. Recognizing the failings of most of his own race he chose as his council white men with one exception. By his valuable administration the commerce as well as the agriculture of the island began to revive. After the Peace of Amiens Napoleon sent a powerful expedition under his brother-in-law, Leclerc, to subdue Toussaint, who after a stubborn struggle was forced to surrender and on his oath of fidelity was permitted to retire to his estate. He afterward detected conspiring against the French and being seized by a somewhat unworthy stratagem, was sent to France, where he died in prison. At the time a suspicion of poisoning was general, but there is no evidence to support it. Consult his "Memoires" (1833); the lives by Saint-Rémy (1850), Gragnon-Lacoste (1877) and Schechter (1889); Mosseil, "Tou-saint L'Ouvriere, the Hero of Santo Do-mingo" (Lockport 1896).

TOWAKONI, a sub-tribe of the Wichitan of the Caddoan linguistic stock of North American Indians, who in 1719 were found on the Cimarron, near its junction with the Arkansas in the present Creek Nation, Indian Territory. Later they were on the Brazos and Trinity rivers of Texas and in 1822 were reported to number 1,200. They made their first treaty with the United States in 1837. In 1840 they were said to have numbered 500 and to have resided on the Pecan branch of the Colorado River of Texas, but by 1850 their population was reported at 140 and their home on the Upper Brazos. They are now with the Wichitas on a reservation in Oklahoma, where they number about 130.

TOWANDA, tow-ahn-da, Pa., borough, county-seat of Bradford County, on the Susquehanna River and on the Lehigh Valley Railroad, about 50 miles north by west of Scranton. It is in an agricultural and stock-raising region and is the commercial and industrial center for a large portion of the country. The chief industrial establishments are planing-mills, furniture factories, wagon and carriage works, a large toy factory, a piano factory, foundries and machine shops. The water supply comes from springs 16 miles from the
The educational institutions are Susquehanna Collegiate Institute (Presbyterian), in 1850, a high school, public and parish high school library containing about 60,000 volumes and a college library. The two buildings have a combined capital of over $200,000.

**ER, Charles Magna, American diplomat.** Philadelphia, 17 April 1848. He was d at Harvard in 1872 and spent four years studying in Germany and Spain. After his return he settled in Philadelphia and in 1891 became active in business affairs and gave his time to historical studies. He became a member of the American Historical Society and was a contributor to the Quarterly Journal of Education. He was a prominent author and a contributor to several periodicals. He was the author of several works on the history of the United States, including a history of the Mexican War and a history of the War of 1812. He was also a contributor to the Quarterly Journal of Education.

**ER, Zealous Bates, American soldier.** Settled, Mass., 12 Jan. 1819; d. there, 21 Dec. 1890. He was graduated from West Point in 1841 and was appointed second lieutenant of artillery on the same day. He was made a major in the Mexican War in 1843 and served with distinction in the Mexican War. He was brevetted major in the Mexican War in 1861, and was killed in the first battle of Bull Run. He was a widely respected officer and a man of great ability.

**TOWER — TOWHEE BUNTING**

The round towers (q.v.) of India, Ireland and other countries. The tower bastion of medieval castles contained rooms and cells. (See BASTION). Water towers are similar to the round towers and were used for storing water. (See CAMPANILE; EIFFEL TOWER; PISA; MONUMENTS; RAGEA; TOPE.

**TOWER, Round,** a building peculiar to early Christian architecture, of slender form and usually having a conical roof. Windows are few in number and generally small. The type is common to Ireland, and in addition to the Irish bee-hive huts forms its only distinctive contribution to architecture. (See IRELAND, Architecture). More than 100 exist in Ireland. A few examples are to be found in Great Britain and on the Continent, pointing to the time of the invasion of the Irish missionaries. The smallness of the windows seems to make it improbable that the towers were used for bells and rather points to their employment for defensive purposes. The name is given to remains of the numerous round towers of the Pueblo type. They are found standing in isolation or in connection with walls of rectangular form. They are built of roughly-dressed stone and are interesting structurally for their three concentric walls, with the two outer ones connected by transverse walls on radial lines. See IRISH ARCHEOLOGICAL REMAINS; IRISH ART.

**TOWER BRIDGE, London.** See BRIDGE; paragraph Movable Bridges; also LONDON.

**TOWER CLOCKS.** See Clocks.

**TOWER OF LONDON.** See LONDON.

**TOWER MUSIC.** See CHIMES.

**TOWER OF SILENCE.** This name is applied to structures built by the Parsees for the disposal of their dead. They are towers—called dakhmas—about 40 feet high and with a large diameter. Somewhat below the top of the wall is built a floor of iron grating and upon this the bodies of the dead are placed until they decay and are removed. The bones are then placed in a pit below. There are evidences that they were carefully chained. One of these "towers of silence" stands in the neighborhood of Bombay, India. It is believed that their primary purpose was sanitary, to prevent contamination of local soil and water.

**TOWER OF THE WINDS, See ATHENS.**

**TOWHEE BUNTING,** a large, black, white, and chestnut bunting of the American genus Pipilo, several species of which occur in the United States. Several are confined to the southwestern United States, but one species, the chen-wing, or ground-robin (P. crypsithalamus) is numerous in summer throughout the whole of the eastern half of the country, and its sharp, metallic call is familiar to every countryman. In spring the male has a delightful song, but one not frequently heard. The nest of the towhee is made upon the ground in the woods, where the birds spend most of their time, scratching vigorously among the leaves for their food, and its five red-spotted eggs are cleverly concealed by a thickened and plumed canopy of twigs and leaves. Consult Wilson, Audubon and other writers on American birds.
TOWN, Ithiel, American architect: b. Thompson, Conn., 1784; d. New Haven, Conn., 1855. June 18, 1841. Alexander J. Davis he designed the old Capitol at Washington, the city hall at Hartford and the State capitol at Indiana and North Carolina. The town also designed churches at Hartford and New Haven and a bridge at Richmond, Va., over the James River. He was the author of a number of books on architectural and other subjects. His large library went in part to Yale College. He was one of the original members of the Academy of Design.

TOWN GOVERNMENT. See MUNICIPAL GOVERNMENT; TOWN AND TOWN MEETINGS.

TOWN AND TOWN MEETINGS. In its broadest meaning the word town denotes simply a collection of houses without regard to the size of the collection and without regard to the form of its political organization. In some sense a hamlet without any governmental powers at all of its own may be referred to as a town and likewise a great municipality like New York or London may be thus designated. In some of the Southern and Western States "town" is the legal designation of a municipal corporation whose powers are greater than those of a village and smaller than those of a city. In the New England States, while the word town is often used in a loose or broad sense, more frequently a town denotes a minor civil division (elsewhere called township) which is sometimes wholly rural, sometimes wholly urban and sometimes partly rural and partly urban. An advertised meeting of the voters of a New England town summoned for the consideration of local business is called a town meeting.

The Pilgrim Fathers who settled at Plymouth (1620) and the Puritans who settled (1628-30) at Salem and Boston began at once to develop a system of local government. They settled in compact communities and gave the name town to the thickly inhabited portion of a grant or purchase. The organization of the town was accomplished through the agency of a town meeting. The early settlers of New England were social rank; their average of intelligence was high; they were nearly equal in worldly possessions. Respecting matters of government, they were intensely democratic and at the same time intensely theocratic. They believed that the state should be a "city of God" and that authority in spiritual and temporal matters should flow from a common source. Accordingly their town meetings were religious assemblies acting as pure democracies, except in Rhode Island, where the civil authority did not interfere in matters of conscience. The meetings in colonies where the theocratic principle prevailed were usually held in a church, and all the male church members of the town who were of legal age could attend and take part in the discussions and vote upon any question that might arise. The town was incorporated and its boundaries were defined by the colonial legislature. It was then held that the church was a pretty church in its own way, providing, of course, it did nothing contrary to the laws of the colony. At first, while local government was getting under way, town meetings were called every month or two. In Boston in 1635 10 general town meetings were held. The people soon found, however, they could not give so much time to affairs and it was not long before it became the custom to summon the town meeting but once a year, provision being made for special meetings when there was need. These town meetings elected such officers as were required for the management of local business and made such by-laws as they thought necessary to the good of the community. For the management of the town during the interval between meetings a board of townsmen, usually selectmen, was elected. The number of men in the earlier towns ranged from 3 to 17. These officers administered the finances of the town, appointed subordinates, paid out contracts for public work and exercised powers as were necessary to secure and maintain the peace, safety, comfort and reformation of the people. As stewards of the people they gave to the town meeting an account of their stewardship in the form of an annual report. A town clerk, who acted as secretary of the meeting, was named by the recording officer of the town, and was responsible for the safekeeping of the records of the town, whose duties, broadly speaking, were that of a peace officer, were always in the hands of the selectmen, the clerk and the constables, the constitutive officers; no town was without them. Among other officers elected in the town meetings may be mentioned the town constable, who saw that the people came to church and with forward kept them awake during the sermon; the Constable, who supervised the erection of boundary fences between adjoining owners; the hog-reeve, who saw that rings were kept in good order; the driver, who impounded stray cattle. Representatives to the colonial legislature were elected in town meeting. Besides elected officers, the town meeting acted as a lawyer for all matters of local concern. It levied town taxes; it passed by-laws relating to the use of common fields and pastures; it assigned lands to individuals; it divided the province for the management and support of schools. In all New England colonies Rhode Island excepted, local government was regulated and controlled by the church, subject to the superior authority of the crown. No detail of the civil or religious life of the community was too small for the attention of the town meeting. It prescribed the manner in which the schoolmaster should be paid; it directed the arrangement of school buildings; it specified the hours of work which the woodman should begin to wield his axe.

Such was the early New England meeting. Its origin is traced by some of political science to the Anglo-Saxon and to the still earlier Teutonic manor. Early New England town certainly bore strong resemblance to the ancient type of Teutonic local government. The name "town" reminds us of the Saxon tun (Old English tun, a hedge); the selectman reminds us of the Saxon gerefa, headman (he was actually "headman" in Rhode Island); the town was, in many particulars, a counterpart of the Saxon Tunmoot. There is no evidence,
TOWN AND TOWN MEETINGS

The New England settlers consciously any existing or pre-existing type of government when they developed their town. They brought to their task English and English and shrewdly they domesticated English experience, own an institution, both in its origin and in its functions, was an outgrowth of the peculiar social, economic and conditions which prevailed in New during the first years of the colonial

own meeting system described above in the settlements of Plym and and Boston and was adopted by oots of the parent towns. When population of a grant or purchase sufficiently large to support a church and local government it was incorporated central legislative body and a town was called. Thus the town organization grew and was soon deeply affected by the affections of the people. It remained a society that was purely democratic any world had ever seen. During its early formative period its chief characteristic of New England life, and when the town came the little democracies proved vital aids in the cause of liberty. In meeting it could easily be learned who al and who were not. Through the town organization military stores were sold and the famous minutemen (q.v.) anarized. The resolutions of numerous meetings voiced in the plainest manner the sentiment for independence and the destruction of the Crown in favor of the measure, yeomanry of this selfish community en to overwhelm the Union. In another great Democrat says: "They [New towns] have proved themselves the experiment ever devised by the wit of the perfect exercise of self-government for its preservation."

Essential characteristics town government New England has not changed greatly days of the early settlers, except in its feature; that feature entirely disappeared in the early part of the 19th century, separation of Church and State was Details in the organization and in rs with the other New England States, yet the outlines of town government in all these States are practically and are as follows: The State legislates the boundaries of the town, and makes laws by which the town operates. As a result, the town can sue and be sued, acquire and hold real property. A be divided by the legislature into two townships or can be united with and made another town. The public affairs of another town. The public affairs of are transacted in a town meeting which meets annually, and also assembles in special meetings which may be called from time to time. The meeting is held in the town hall or in some other hall sufficiently large to accommodation. When a sufficient number of people have assembled, the town clerk calls them to order and states the purposes for which the meeting is called. A moderator (presiding officer) is then chosen and business proceeds according to parliamentary rules. All questions are decided by a majority vote of the qualified voters in attendance. Usually citizens who are qualified to vote for a governor and for members of the State legislature are also qualified to vote in town meeting. Here is democracy in its purest form. Young and old, rich and poor, the obscure and the prominent, are present, and every citizen may not only vote, but, if he chooses to do so, may also bring the full force of his character and influence to bear upon the delibera of the meeting. Routine business is quickly disposed of, but those matters which happen to be the subject of contention are generally discussed fully and freely. The right to vote on local taxation and assessments on the part of taxpayers. The finances of the town are watched keenly, and if there has been mismanagement or extravagance during the past year there is sure to be a merciless exposure in the town meeting. If improvements are needed or if the town is lagging behind its neighbors in progressiveness, the discussion in the folkmoot is likely to be directed toward a remedy. At annual town meetings the following things are done: (1) The rate of taxation for the coming year is fixed. Money is appropriated for the schools, the care of the roads, for the support of the poor, for the salaries of officers and for other necessary expenses. Sometimes the schools are managed by school districts. When this is the case each district elects its own officers and sometimes also makes its own levy, but the town meeting or town council elects the school superintendent. (2) By-laws are passed. These may relate to such matters as measures of general health, the erection of buildings, the regulation of the speed of vehicles. Many things which in other places are done by a body of chosen representatives are done in town meeting by the people themselves acting as legislators. (3) Town officers are elected. At the head of these stand the selectmen, or councilmen, three or five or seven in number. These are the executive officers of the town. They supervise the construction of roads, grants licenses, care for the poor, abate nuisances, check the spread of contagious diseases, listen to the complaints of those who have grievances of a public nature, select jurors, canvass the voting list, look after the paupers and represent the town in court wherever the different interest of the town may call. When a specified number of voters sign a call for a special town meeting it is the duty of the selectmen to act as the selectmen to place on the town post a warrant which calls the meeting and states the purposes for which it is called. After the selectmen, the town clerk is next in importance and usefulness. This officer calls the town meetings to order and keeps a record of its proceedings. In addition, he usually keeps a record of the births, marriages and deaths and grants certificates of marriages and the real estate records of the
TOWNE

town. Town assessors make out a list of the taxpayers of the town and place an estimate upon the value of their property. Sometimes the selectmen themselves act as assessors. In addition to the officers mentioned the town meeting usually elects tax collectors, a town treasurer, town solicitor, overseers of the poor, a school committee, trustees of the town library, constables (peace officers), surveyors of highways, fence-viewers, milk inspectors and field-drivers of the government's crops. At meetings of these officials to the town council. All town officers have a tenure of one year. The list of officers which has been given is not complete, yet it is long enough to show that in every New England community a great many people must take a part in public affairs. Undoubtedly it is this general participation in the business of government that makes the people of this part of our Union such a wide-awake and progressive body of citizens.

In all the New England States (Massachusetts excepted) the town is the unit for representation in at least the lower branches of the State legislature. Government in New England is, therefore, by towns rather than by counties. This is true in New England because the State has so many functions and absorbs so much local business that little is left for the county to do. Indeed the county in New England exists principally for judicial purposes; in Rhode Island it exists solely for judicial purposes. As it is 20 days a month it has always been throughout the whole period of its history the focus of New England life has been the town. *Towns,* says Joel Parke, "have been the arterial system of New England through which has circulated the life-blood which has invigorated, sustained and strengthened her, making her expand in her religious, social, educational, benevolent and political institutions." The people cling tenaciously to their town system. Boston did not change from town to city government until 1820 when, with a voting population of 7,000, she found that the town meeting could no longer act as a deliberative body. Yet the conditions of population in recent years sometimes make it difficult to transplant local government on the town plan. People are moving from the country to the city, depleting some towns and making others too large to meet in mass. Towns in New England vary in population from less than 100 souls to 20,000. As a matter of experience local government in New England is changing with the new conditions. So long as the population of a place remains below 10,000 (the population of Aristotle's ideal city) town government is usually economical, efficient and pure, but when the population greatly exceeds that number the interest of the citizens in local matters begins to flag, the town meeting becomes unmanageable and the town government often falls into unworthy hands. The remedy is municipal incorporation. The thickly inhabited part of the town secures a charter and becomes a borough or village or city and the people surrender a part of the public business to chosen agents. The town meeting does not extinguish town government within the boundaries of the new municipality, although it does take from it many of its former powers.

While town government in its pure form is found only in New England, modifications of it appear in those Western States where England emigrants, notably in Illinois, Wisconsin, Minnesota and . Each of these States has provided by a system of local government which is more or less closely the New England. In Michigan, for example, the voters township, after they have elected officers, meet in the afternoon in the transaction of certain local business. At meeting they may regulate the keeping of gunpowder, the licensing of the inhabitants; they may under certain restrictions, and the sale of books for the town may raise money by the purchase of books for the town. In Illinois, in those towns which adopted the township system, there is a meeting of the voters after the officers have been elected. Here we have at least of the town meeting, but it appears that the spirit of the New England vivifies these western meetings. A government in the West has always continues to be essentially representative. New England town meetings continue to-day, sometimes for two days, and attendance for so long a time means expense and money loss. Representative government, on the other hand, requires sacrifice. Because town government is much of the citizen's time and energy, and with such great responsibility, it has extremely difficult to transplant it. The of the town meeting has undoubtedly had an influence upon the course of local government in all parts of the Union, but it cannot be that town government, either in spirit, form, is vigorous in any State outside of England.

TOWNE, Henry Robinson, manufacturer: b. Philadelphia, Pa., 1844. He attended the University of Pennsylvania but left school to become a draughtsman in the Port Richmond Iron Works. In he was placed in charge of the steel shops and later, in 1864, was in building the engines for the iron works. He important work until the close of the course of time he took a special in physics at the Sorbonne, Paris, and became associated with Linus Yale in his famous locks, and after the latter was president of the company. Later he became chairman of the serve Bank of New York and was with other business interests. He is of Towne on Cranes (1883) : technical papers.
TOWNE SCIENTIFIC SCHOOL — TOWNSEND

TOWNE SCIENTIFIC SCHOOL, a department of the University of Pennsylvania. See Pennsylvania, University of.

TOWNELEY, Charles, English art collector: b. Burnley, Lancashire, 1737; d. London, 1805. He was educated at Douai College and began collecting art objects abroad in 1768. He made frequent trips abroad for the purpose. In 1791 he was made a trustee of the British Museum. His collection of marbles, known as "The Towneley Marbles," together with his statuary, medals and other gems of ancient art, was bought by the museum after his death. Consult Ellis, 'The Towneley Gallery' (London 1846).

TOWNELEY MARBLES, a notable collection of Greek and Roman sculpture, forming a portion of the gallery of antiquities in the British Museum; so named after Charles Towneley, by whom the collection was made.

TOWNSEND, Charles Elroy, American politician: b. Concord, Mich., 15 Aug. 1836. He was educated at the Jackson High School and at the University of Michigan, and was admitted to the bar in 1855. He was a delegate to the Republican National Convention in 1868 and served on the State, Central Committee (1899-1902). In 1903-11 he was elected a member of Congress from the second Michigan district, and on 18 Jan. 1911 was chosen United States Senator.

TOWNSEND, Charles Haskins, American zoologist: b. Parnassus, Pa., 29 Sept. 1859. He was educated at public and private schools and became assistant United States Fish Commissioner in charge of salmon propagation in California in 1883. He remained in the government service in various positions until 1902, when he was made director of the New York Aquarium, a position which he still holds. He is author of numerous monographs relating to fisheries, fish culture, etc.

TOWNSEND, Edward David, American soldier: b. Boston, Mass., 22 Aug. 1817; d. Washington, D.C., 13 May 1903. He graduated from West Point in 1837, served in Florida 1837-38 and on the Canadian frontier in 1838-41; was promoted captain in 1848 and colonel in 1861. In the year last named he made chief of staff to Lieut.-Gen. Winfield Scott. In March 1865 he was brevetted major-general United States army, and was placed on the retired list in 1880. He published 'Catechism of the Bible — The Pentateuch' (1859); 'Catechism of the Bible — Judges and Kings' (1862); 'Anecholes of the Civil War in the United States' (1884).

TOWNSEND, Edward Waterman, American author: b. Cleveland, Ohio, 10 Feb. 1855. He was for some years on the staff of the New York Sun and in 1895 became widely known by his "Pennsylvania, University of Major Max," in which a typical New York boy of the rougher class is depicted. Later works include 'Chimie Padden Explains, Major Max Expounds' (1895); 'A Daughter of the Tenements' (1896); 'Beavers and Leaven' (1903); 'Reuben Larkmead' (1905); 'Our Constitution' (1906); 'Beaver Creek Farm' (1907); 'The Climbing Courvatels' (1909).

TOWNSEND, George Alfred, American journalist: b. Georgetown, Del., 30 Jan. 1841; d. 15 April 1914. He was graduated at the Philadelphia High School in 1860 and entered journalism. He was special war correspondent of the New York Herald and World in 1861-65, afterward engaged as a lecturer, and in 1866-67 he was in Europe as special correspondent in the Austro-Prussian and later at the Paris Exposition. For many years after 1868 he was an editorial writer and correspondent on the staff of the Chicago Tribune, and his contributions to the press, under the penname "Gath," have been widely read. His publications include 'Campaigns of a Non-Combatant' (1863); 'The Real Life of Abraham Lincoln' (1867); 'Washington Outside and Inside' (1871); 'Tales of the Chesapeake' (1880); 'The Entailed Hat' (1884); 'President Cromwell' (1885); 'Mrs. Reynolds and Hamilton' (1890); 'Columbus in Love' (1892); 'Poems of Men and Events' (1899); 'Poems of the Delaware Peninsula,' etc.

TOWNSEND, Lawrence, American diplomat: b. Philadelphia, 13 Aug. 1860. He was educated at the University of Pennsylvania and spent some six years in Europe in the study of international law and the history of the Hague Peace Conferences. He was first secretary of the American legation at Vienna 1893-97, Minister to Portugal 1897-99 and Minister to Belgium, 1899-1905.

TOWNSEND, Luther Tracy, American Methodist clergyman: b. Orono, Me., 27 Sept. 1838. He was graduated from Dartmouth in 1859 and from Andover Theological Seminary in 1862, served in the Federal army during a portion of the Civil War, and in 1864 entered the Methodist ministry. He was professor of Hebrew in Boston University 1868-70 and of practical theology there 1872-73. He has since been professor emeritus. He has published among many other works 'Credo' (1869); 'Bible Theology and Modern Thought' (1883); 'Evolution of Creation' (1899); 'God's Goodness and Severity' (1903); 'God and the Nation' (1903); 'Doctrine of the Trinity' (1903); 'Bible Studies' (1913); 'God and War' (1915); 'Hell Is No Myth' (1917).

TOWNSEND, Thomas Seaman, American compiler: b. New York City, 27 Aug. 1829; d. there, 1908. He was given a classical education but devoted himself to commercial life. His renown rests chiefly on a compilation of newspaper clippings relating to the Civil War which fills 125 large volumes and forms a mine of information for the historian of the times from 1860 to 1901. The collection is in Columbia University Library and is entitled the 'Townsend Library of National, State and Individual Civil War Records.' He also lectured and gave addresses on the War of the Rebellion.

TOWNSEND, town's-end, Charles, 2d Viscount, English statesman: b. Rainham, Norfolk, 10 March 1674; d. there, 21 June 1738. On the death of his father, the first viscount, in 1687, he succeeded to the peerage and took his seat as a Whig in the House of Lords, 1695. He was one of the commissioners for arranging the Scotch Union (1706), was joint plenipotentiary with Marlborough in the conference at Ge rtruyen burg (1709), and as ambassador to the States-General signed the Barrier Treaty at The Hague, 29 Oct. 1709. He was
censured by the House of Commons for this action and declared an enemy of the queen and kingdom. He accordingly entered into correspondence with his elector of Hanover, who, on his accession as George I, appointed Townshend his Lord Chamberlain. In 1713 he was made privy councillor and in 1714 he was appointed lord-lieutenant of Ireland; was again Secretary of State from 1721 to 1730, when he retired by reason of disputes with his brother-in-law and colleague, Sir Robert Walpole.

TOWNSHEND, Charles, English statesman: b. 29 Aug. 1725; d. London, 4 Sept. 1767. He was grandson of the 2d viscount Townshend, was educated at Leyden (probably also at Oxford) and entered Parliament in 1747. The next year he received a minor office and in 1754 became Lord of the Admiralty. From this post he rapidly advanced and became a member of the Privy Council in 1757, Secretary at War in 1761, and in 1766 Chancellor of the Exchequer. Pitt's entrance into the House of Lords and eventual incapacity through ill health left Townshend virtually at the head of the government and he held his nominal chief in determining the right of the East India Company to territorial revenue and made use of his official position to secure for himself a large share in a public loan. In 1767 he was defeated on his proposition for a land tax. On 13 May he introduced measures dealing with the American colonies, virtually reviving the principles of the Stamp Act, which had lately been repealed. The American Revolution was caused by the imposition of taxes which he proposed. His reputation as an orator was scarcely second to that of Pitt himself. Of his qualities Lecky has written: "Exuberant animal spirits, a brilliant and ever ready wit, boundless facility of repartee, a clear, rapid and spontaneous eloquence, a gift of mimicry which is said to have been not inferior to that of Garrick and Foote, great charm of manner, and an unrivalled skill in adapting himself to the moods and tempers of those who were about him, had made him the delight of every circle in which he moved, the spoil child of the House of Commons."

TOWNSHEND, Sir Charles James, Canadian jurist: b. Amherst, Nova Scotia, 22 March 1844. He was educated at King's College and became a noted barrister. He was at one time a member of the law faculty at King's College and practiced successfully as an attorney. He was a puisne judge (1887), and since 2 Nov. 1897 has been chief justice of Nova Scotia. He was knighted by King George in 1911. He was conservative member of the House of Commons (1884-87) and held other positions of honor. Among other papers he is the author of "A History of the Courts of Judicature in the Province of Nova Scotia."

TOWNSEND, Charles Vere Ferrers, British soldier: b. 1861. He joined the army in the Royal Marines in 1880 and was a major-general in 1911. His life was one of active service and he was at the front in the Boer War and compelled to surrender at Kut el Amara for lack of food after a five months' siege by the Turks. Previously he had served in the Sudan and Nile expeditions (1884-85), participated in the South African War (1899-1900) and was with the British army in India (1907-09).

TOWNSHIP, a local minor civil or political division of territory within a county in the United States, outside of New England, where they are termed towns. See TOWN AND TOWNSHIP MEETINGS.

TOWNSLEY, Clarence Page, American army officer: b. De Kalb, N. Y., 24 Sept. 1845. He was educated at the West Point Military Academy by the United States Military Academy at West Point (1872-76) and was appointed to the 30th division, National Guard, in 1917.

TOWNSVILLE, Australia, the most important town of northern Queensland, Australia, situated on Cleveland Bay on the east coast. It has a number of fine buildings, including a new cathedral, the Supreme Court building and a large prison. The chief industrial establishments are an iron foundry, an ice plant, a soap factory and meat packing houses. The town has a good harbor and well fortified; it is the terminus of a railroad to Hughenden and the chief outlet for the products of northern Queensland. The Great Commonwealth Bank has a branch here. The exports amount to nearly $15,000,000 annually Pop. 13,835.

TOWSE, John Ranken, American drama critic: b. Stratham, England, 2 April 1845. He was educated at Cambridge University and came to New York in 1869. He took up newspaper work and since 1874 has been dramatic critic of the "Evening Post." He published "Six Years in the Theatre: an Old Critic's Memories" (1913-16).

TOXICOLOGY, the study of poisons. The word poison is difficult to define, since many substances which in minute amounts exert no harmful action on the body may in large quantities produce disastrous effects. Then, again, some substances which are harmless when taken into the stomach, as water, for instance, injected into a blood-vessel prove very dangerous, causing death at times from the destructive action of the water on the blood-cells. Moreover, the many studies of recent years on bacteria and other forms of life have resulted in a new series of conceptions regarding the poisonous actions of the compounds formed by these bodies; and further, certain forms of perverted metabolism of the human body result in the production of certain products which, retained by the body, work harmful effects. (See AUTO-INTOXICATION; METABOLISM.) If all the different factors are taken into consideration, a strictly scientific definition of the word poison cannot be given. In general it is said that a poison is any substance which brings about a change in the molecular composition of an organ or organs, causing its functions to depart very disagreeably from the normal. But what grade of molecular disturbance is necessary to make a substance a
poison, or how far from the normal must be the functional alteration, it is impossible to say. Many substances, strychnine for example, while being distinctly poisonous in appreciable doses, are very useful and helpful to the body when given in small amounts. Infinitesimal doses of some copper salts act as pronounced poisons on certain forms of lowly organized plants, while a higher plant, the potato, does not suffer from large doses used as a spray to kill insect or fungus parasitism.

The modern conception of poisonous action is essentially a physico-chemical one, the distinction between a molecular physical action and a molecular chemical action being difficult to make. But it is believed that for practically all forms of poisons a distinct alteration in the character of the cells of the body takes place, as well as a change in the chemical composition of the poisonous substance. It is impossible at the present time to summarize these changes. It is rare that the reaction between the body-cell and the poison is purely of a physical nature, yet this very frequently happens in many poisons that act on the blood. By some of the poisons—the anilines, for example—the blood undergoes changes not so much due to new chemical compounds formed, as to physical changes in the tension of the blood-serum and the blood-corpuscles, whereby the blood-coloring matters stream out into the plasma, and the oxygen-carrying function of the blood is lost. Similar types of poisoning result from some of the metals, and the poison of the cholera organism is thought to act in a like manner. In other poisons there is a direct union of the ions of the poison with some constituents in the cells of the body, making new chemical compounds, and thus interfering with the molecular activities of the cells. Von Jaksh has divided the poisons into two classes: the exogenous poisons, or those that come from without the body, and enter by way of the skin, the lungs, the stomach or the intestines; and the endogenous intoxications that result from changes within the human body through disordered metabolism. Occurrence of former causes serious changes in the body that death results from an intoxication of the second variety. Thus a severe irritant to the kidneys, such as cantharides, may cause such an acute inflammation of that organ that it cannot secrete urine, and the patient may die of uraemic poisoning. In much the same manner certain bacteria find entrance into the body and develop poisons both within the tissues and also in the intestinal canal, and furthermore provoke putrefactive processes in the food in the intestinal canal. This brings about a triple form of poisoning, as it were.

The different types of poisoning are many. They cannot be given here, but are available, but the symptoms and general treatment of a few of the more common types of poisoning will be mentioned. Poisoning by the mineral acids, nitric, sulphuric, hydrochloric, is not uncommon. In these there is a marked caustication; there is marked pain when taken by the mouth. The lips are stained yellow, black or white respectively, according to the acid taken. There is nausea, vomiting and diarrhoea, with all the symptoms of an intense gastro-enteritis, with collapse, pale face, cold sweating extremities, small, feeble pulse, rapid respiration; and the patient dies in intense agony. Treatment is by prompt washing out of the stomach with an alkaline solution, soap, washing soda or other mild alkali being useful. Then comes the use of several nauseating drinks, such as white of egg, gum arabic, slippery elm, olive oil, milk, etc. The technical details require prompt medical attendance as soon as the washing out with the alkaline solution is commenced.

Oxalic acid is frequently swallowed by mistake. Here the staining is usually absent; the gastro-enteritis is marked as in poisoning with the mineral acids; there is great muscular weakness and twitching of the muscles, particularly about the face; sometimes there are convulsions and further symptoms of collapse are present. In treatment wash out stomach by tube, or by drinking large quantities of water with lime— half a teaspoonful of lime to quart of water. Following oxalic poisoning large quantities of water should be taken for a week or so to flush the surplus oxalates from the kidneys.

Poisoning by alkalis is infrequent. Occasionally sodium hydrate, or potassium hydrate, is swallowed. Lime is also taken by accident; so (rarely) is ammonia. The symptoms are much like those of poisoning by the mineral acids. There are no marked discolorations, as noted, but otherwise the symptoms are similar. Treatment is by rapid washing of stomach with weak acids, vinegar being the most convenient, and by demulcents, as in acid poisoning.

The halogen compounds are very markedly poisonous as gases, notably chlorine, bromine, fluorine; and the iodides and bromides cause forms of chronic poisoning known as iodism and bromism (q.v.).

The heavy metals as such are not poisonous, but their soluble compounds are all poisonous. They vary widely, however, in strength. In order, from the strongest to the weakest, they are caustic or astringent; severe caustic metallic salts being, in order, mercury, tin, silver, antimony, copper, zinc. The salts of iron are not very poisonous. But in poisoning the acid part of the salt is of importance. From strongest to weakest these acids run: hydrochloric, nitric, sulphuric, phosphoric, acetic, citric, tartaric. If a caustic metal is combined with a caustic acid the resulting salt, if soluble, is a very powerful poison, mercuric chloride, or corrosive sublimate, being an illustration. If a weak metal like iron is combined with a strong acid the result is an intermediate poison like chloride of iron; when a weak metal, as lead, is combined with a weak acid, as acetic, lead acetate, sugar of lead, a weak poison, is formed. Thus the strength of a metallic salt may be calculated from the use of a neuter, or mucilaginous, and acid ions. In all these metallic poisons albumen compounds are formed. The coagulum varies in all and according to its solubility or insolubility the burning of the poison is more or less deep. In all the symptoms are analogous; the use of a neuter, or mucilaginous, with symptoms of collapse. The treatment is similar in all: washing of the stomach, white of eggs, milk, demulcents, artificial heat, respiration and afterward careful feeding.

Arsenic and phosphorus are poisons that
TOXICOLOGY

give very similar symptoms: acute gastro-enteritis, with nausea, vomiting, purging; then some grade of apparent recovery, to be followed after a few days with a recrudescence of the gastro-enteritis and the development of secondary blood-vessel changes, which may cause minute hemorrhages in any part of the body. Then follow fatty degeneration and death. The commonest form of salt causing arsenic-poisoning is Paris green; while rat-poison and matches are responsible for most cases of phosphorus poisoning. Treatment of arsenic poisoning calls for prompt washing of the stomach, small doses of magnesia and water every 15 minutes for several hours and stimulant supportives. Phosphorus can usually be detected by the odor. There should be prompt washing, and avoidance of oils, although castor-oil may help in getting phosphorus out of the intestinal canal. Authorities, however, prefer the saline cathartics. A prompt oxidizing agent, permanganate of potash or hydrogen peroxide, should be used, or small doses (1 to 2 grains), diluted, of copper sulphate.

For the effects of poisoning by the alcohols, see AlCOHOLISM. Practically all of the anaesthetics (ether, chloroform, ethyl chloride, etc.) and hypnotics (chloral, paraldehyde, trional, sulphonal, veronal, etc.) belong to the alcohol group (see ALCOHOL), and the symptoms are closely allied.

Phenols form a distinct group in which carbolic acid, creosote, phenol, cresol, pyrogallic acid, thymol, guaiacol, naphthaline, salol, etc., belong. They cause symptoms closely resembling one another. Carbolic acid may be taken as the type. This causes gastro-enteritis, with severe pain, white scar of lips and throat, breathing, dizziness, smoky to blackish urine, pale, bluish face, weak heart, quick breathing, coma and sometimes convulsions. Treatment is by quick washing of the stomach. A mixture of lime and sugar of syrupy consistency, Epsom salt, milk, white of eggs, cardiae stimulants and artificial respiration are all valuable.

Another large group of poisons, the anilines, includes many of the modern drugs, such as acetanilid. Closely allied are different amine dyes. Also phenacetin, antipyrin. In these characteristic signs of poisoning are somewhat similar to those seen in the phenol group, but in the more pronounced ones of this series the main changes occur in the blood. There is blueness of the skin and lips, difficulty in breathing, sometimespinkish to purplish urine, rapid and feeble heart action. The chief changes are due to a partial destruction of the red blood-cells. In phenacetin the blood rarely disintegrates as in antifebrin or acetanilid; whereas in antipyrin there is no real blood alteration. In most of these forms is the prompt evacuation, cardiae stimulation, oxygen and, most important of all, artificial respiration.

Alkaloid poisons (seeALKALOIDS) are numerous. The commonest forms of poisoning from these, the most powerful poisons, are morphine (opium, laudanum, paregoric), strychnine (pox yonica), atropine (bella- donnium, cocaine [coca], aconite [aconite] and nicotine [tobacco]). In acute opium poisoning the classical symptoms are drowsiness, coma, small pin-point pupils, loss of pain, slow breathing (six to eight to a minute), moist skin, dry mouth, rousing with more or less active consciousness and quick relapse. Treatment is by washing the stomach with hot strong tea or coffee, by mouth or by rectum, and by artificial respiration. Too much walking of the patient about is not desirable.

Strychnine poisoning causes twitching of muscles, cramps, irregular muscular movements, convulsions at slightest jar or touch, fixation of muscles of breathing, with cyanosis. Treatment is by great quiet, alcohol, chlorine and stimulants.

Belladonna poisoning shows wide-awake, restless consciousness, sometimes active, busy delirium; dry mouth, skin hot and flushed, pupils widely dilated and paralyzed to light and accommodation, rapid feeble heart and rapid respiration. Treatment is by prompt evacuation of stomach, sodium bromide, opium, caffeine or coffee.

Another group of glycoside poisons is characterized by a great similarity in action. Many of these are used in medicine and some were used as arrow-poisons by wild natives. The group contains digitalin (digitalis), strophanthus (strophanthus), convallarin (lily-of-the-valley). Bryonin (bryonia), apocynin (dogbane), oleandrin (oleander), scillain (squill), etc. These are all heart poisons. They first quicken the heart, then slow and regulate it, hence their usefulness in many heart diseases; but in overdose they paralyze the heart by overstimulation. At these drugs rarely cause poisoning, the treatment is omitted.

Tox albumins form a group of special character, and all are very violent. Some are of vegetable and others of animal origin. The most important are abrin (in jequirity-seeds), ricin (from the seed-coats of the castor-oil bean—frequently causing death in children who eat the whole bean), phallin (in poisono mushrooms), rattlesnake poison, cobra poison, heloderma and the poison of lizards, etc.

The most important of the bacterial toxins, some of which might be classed here, are discussed under their respective heads. For the endogenous intoxications see the articles on the infectious diseases, tuberculosis, pneumonia, tetanus, typhoid, etc.; also the diseases of metabolism, uraemia, diabetes, Basedow’s disease, Addison’s disease—thyroidism, myxedema, cretinism, etc. See TOXINS AND ANTITOXINS.

SMITH ELY JELLIFFE, M.D.
Editor of ‘Journal of Nervous and Mental Diseases.'
TOXINS AND ANTITOXINS

Mitchell and Reichart (at the University of Pennsylvania) first demonstrated that the poisonous constituents of snake venom are proteins, or closely related bodies. This statement did not meet with favor in Europe, especially in Germany, at the time, but further studies have confirmed it and it is now a well-established fact that some of the most powerful poisons known are proteins, or at least so closely associated with proteins that all attempts to obtain them free from proteins up to the present time have failed. Such bodies have been found in animal, vegetable and bacterial life, but are limited to certain genera and species. In 1887 Sewall (at the University of Michigan) reported a research which should be recorded as the first step in the discovery of methods of securing immunity to the action of these protein poisons, now known as toxins. Sewall studied the effects of the venom of the rattlesnake on pigeons. Finding that the minimum fatal dose of this poison was at first administered less than this quantity, and, by gradually increasing the dose, established an immunity which enabled the pigeons to bear without apparent harm many times the minimum fatal quantity. That the time appreciated the possible bearing and significance on protection against disease of his results is shown by the following quotation from his report: "This work was undertaken with the hope that it might form a worthy contribution to the theory of prophylaxis. I have assumed an analogy between the venom of the poisonous serpent and the ptolemae produced under the influence of bacterial organisms." In 1891 Ehrlich, in a similar manner, succeeded in establishing in animals a high degree of immunity against two of the most potent protein vegetable poisons—ricin, from the castor bean, and abrin, from the jequirity bean. One gram of ricin is sufficient to kill one and one-half million guinea pigs, and the potency of abrin is about one-half that of ricin. To these poisons immunity, as Ehrlich demonstrated, is easily established by feeding the animals by the mouth upon small and gradually augmented doses of these poisons in the venom from snake venom in being absorbable from the alimentary canal, the resemblance in potency and in the production of immunity is striking. Moreover, like snake venoms these are protein poisons. Ehrlich made two important advances over preceding workers. He found that the immunity produced with these substances is specific. An animal immunized to ricin has no immunity to abrin, and vice versa. It was later found that this specificity holds good with all poisons of this class. In the second place, Ehrlich found that the blood serum of the immunized animal contains the immunizing agent, and that transfusion of this serum to a fresh non-treated animal confers a passive immunity upon the recipient. Moreover, this transferred immunity is quantitative. If the first or actively treated animal has been given an immunity of 10 times the fatal dose, and no more, then one-tenth of its blood will be required to give the fatal animal one minimum lethal dose, while if the actively treated animal has been immunized to 100 fatal doses, one-hundredth of its blood serum will immunize a fresh animal to one fatal dose, and one-tenth of its serum to 10 fatal doses. Furthermore, he found that the immunity of an actively treated mother may be transferred to the nursing young through the milk. Roux and Yersin of the Pasteur Institute found that cultures of the diphtheria bacillus, especially cultures four or five weeks old, when freed from the living organism by filtration through porcelain, contain a poison similar in many respects to snake venom and the vegetable products ricin and abrin. The bacteria—free cultures—when injected into guinea pigs even in minute doses, killed the animals in the same time and with the same symptoms and lesions that result from inoculation with the living organism. Von Behring later immunized larger animals, first goats, then horses, to filtered diphtheria cultures, and demonstrated that the blood of animals thus immunized has both protective and curative value in the treatment of diphtheria. The toxin obtained at the minimum fatal dose of this culture of the diphtheria bacillus at 38°C for two weeks or more and then removing the bacteria by filtration. In other words, diphtheria toxin is an old filtered culture of the diphtheria bacillus. The potency of the toxin and the duration of the toxins, all of which must be considered when one attempts to secure a highly active product. The medium generally employed for the growth of the diphtheria bacillus consists of beef tea containing 1 per cent of sodium chloride, from 1 to 3 per cent of peptone, and made feebly alkaline with a solution of sodium carbonate. This medium is placed in glass flasks, each of which should not be more than one-third full in order that there may be a large surface exposed to air which favors the growth of the bacillus and the production of toxin. The flasks are inoculated by floating small masses of diphtheria bacillus growths, taken from agar tubes, on the surface of the beef tea in the flasks. After having been thus inoculated, the flasks are kept at 37°C for about 14 days, when they are filtered and the filtrate constitutes the diphtheria toxin. The toxin solution quickly loses its potency when freely exposed to the air. If properly protected it remains without material deterioration for months, and under most favorable conditions, for years. Protection is secured by covering the toxin solution kept in dark bottles with a layer of toluol. In this way both air and light are excluded. Protection is made more complete by keeping the bottles in a dark room, the temperature of which does not rise above 15°C. When portions of the solution are to be used, withdrawal is made by means of a pipette. The precautions which has caused the toxin solution may be kept without marked loss in toxicity for two years or even longer. Before the toxin prepared as stated above is used in the preparation of antitoxin, its strength must be determined. This is done by ascertaining the minimum amount of it necessary to kill a guinea pig of from 200 to 300 gram-weight within from three to five hours. This amount is known as the minimum lethal dose. When most laborers engaged in the preparation of diphtheria antitoxin, the toxin is not regarded as sufficiently
TOXINS AND ANTITOXINS

potent unless the minimum lethal dose does not exceed 0.02 cubic centimeter. However, it is not always easy to secure a lethal dose of the toxin. Weaker solutions may be used. Occasionally a much stronger product is obtained, and when this happens the preparation is greatly prized and carefully kept under the conditions mentioned above. Horses free from disease are carefully selected by skilled veterinarians. Usually they are submitted to a malein test to be sure that they are free from glanders. During the procedure the animals should be carefully guarded against wounds however slight, since these may serve as ports of entry for tetanus infection. Into these horses the toxin solution is injected, at first in small amounts. The first dose is usually followed by a transient disturbance in health. This may be slight, and indeed may not be in evidence at all. However, often after the first dose the animal's coat roughens, the appetite is impaired, and it may show some elevation of temperature. When there is complete return to health, usually after three or four days, a second injection of the toxin is made. It is safer to make the second injection no larger than the first. Indeed, the practice is to make the second injection slightly less than the first. In this case there is usually no recognizable disturbance in the well-being of the animal. After the third or fourth treatment the quantity of toxin used can be rapidly increased and it soon develops that the animal bears without apparent effect many times the amount which if used without previous treatment would have caused death. After this condition of immunity has been secured, a portion of blood is drawn from a vessel in the neck of the horse, allowed to coagulate, and the separated serum tested for its antitoxic strength. This process is known as the standardization of the antitoxin. The procedure consists in ascertaining how much of the blood serum of the treated horse is necessary to neutralize 100 minimum lethal doses of the toxin. The serum of the horse and the toxin are mixed in varying proportions in vitro, and the mixture injected into guinea pigs of from 200 to 300 grams weight. The amount of toxin taken in these mixtures represents 100 minimum lethal doses, and the minimum amount of serum which must be added to this so that the mixture will have no effect on the guinea pig is known as an immunity unit. It will be seen from what has been said that the filtered culture of the diphtheria bacillus constitutes the toxin, while the blood serum of the immunized horse constitutes the antitoxin. Both of these are standardized, and one neutralizes the other quite as effectively as acid neutralizes alkali. Diphtheria antitoxin, which is the blood serum of an immunized horse, is put on the market in tubes fitted with hypodermic needles and ready for use without transfer. This avoids the possibility of contamination after the preparation leaves the last preparation of the manu-

According to Wernieck's saving of lives during the first year of the use of diphtheria antitoxin in Germany amounted to 20,000, and if the agent were promptly and properly used the saving of lives would amount in that country to 45,000 annually. The value of diphtheria antitoxin is even greater than is indicated by the lowering in the death rate from this disease. For every sick child treated with antitoxin, on an average five are saved from being sick. While the curative value of antitoxin is great, its preventative value is still greater. The diphtheria physician called to a family in which one child has diphtheria gives a curative dose of antitoxin to the sick child and immunizing doses to the others. Even when the sick child has been neglected so long that the curative value of the antitoxin is lost, its preventive value in the others is still potent. Diphtheria antitoxin has lowered not only the mortality rate but still more the morbidity rate. In 1880, before the discovery and employment of this agent, deaths from diphtheria in the registered area of the United States amounted to 112,600 per 100,000; in 1913, after the general employment of diphtheria antitoxin, it was 18.8. Certainly it is no exaggeration that the discovery of diphtheria antitoxin is one of the most beneficent of the achievements of modern life, and it could not have been made without animal experimentation. The preparation of this agent necessitates the sacrifice of the lives of hundreds of guinea pigs, and it leads to the saving of the lives of thousands and tens of thousands of children.
TOXINS AND ANTITOXINS

State and municipal laboratories are employed in the detection and recognition of diphtheria, and antitoxin is furnished free to the physician when the measured amount is to be used. When a physician sees a case which he suspects to be diphtheria he makes a swab from the throat of the child and transfers this in a sterilized test tube to the municipal laboratory. Here the culture is made and after 12 hours a positive statement can be furnished as to the nature of the disease. Even this delay is unnecessary if the physician is sufficiently confident that he has a case of diphtheria to deal with. Under proper precautions there is no danger in the administration of this agent. In the more enlightened communities school medical inspectors are constantly on the watch for the first evidence of this disease and the child of the poorest citizen is transferred and treated in a municipal hospital with as much skill and care as the richest can secure. Since diphtheria toxin has not been obtained in a pure state, its nature, so far as its chemistry is concerned, remains unknown. There is still doubt as to its just in what group it should be classified. Usual methods of purification have been tried, but preparations have been secured which do not respond, altogether at least, to these tests. The molecular weight of the toxin is much less than that of the antitoxin because the former filters readily through porcelain and diffuses quickly through gelatin, while the antitoxin is largely removed from solution by filtration through porcelain and does not diffuse through gelatin. From these facts it is inferred that the molecule of the antitoxin is much larger than that of the toxin. The toxin is highly susceptible to heat, a temperature of 60°C. being sufficient to markedly reduce, although it does not wholly destroy its toxicity. A like effect is induced by the presence of both mineral and vegetable acids. Even lactic and tartaric acids speedily render it inert and its toxicity is reduced, although not completely destroyed, by borax and boric acid. It is highly susceptible to the action of oxidizing agents such as potassium permanganate. A 1:10,000 solution of lime is retained, and when passed through parchment but does not pass through animal membranes or colloidon sacs. It is insoluble in alcohol, and prolonged contact with this agent destroys its toxicity. It is also robbed of its virulence by the digestive ferments present in the alimentary canal, and therefore is harmless when taken into the mouth, provided there is no break in the continuity of the mucus membrane. From solution it is carried down mechanically on the addition of calcium chloride, which precipitates calcium phosphate. In this respect diphtheria toxin closely resembles the enzymes. There are other respects in which this resemblance is evident. Some of these are as follows: (1) It is destroyed by heat; (2) in its purest state it contains no fermentative or reproductive character of proteins; (3) it is active in high dilutions; (4) it is a product of cell activity; (5) when introduced into the body there is a period of incubation before the development of its effects; (6) when introduced into animals in progressive or acute doses it leads to the production of an antibody.

The chief objection to accepting the theory that toxins are enzymes or ferments lies in the fact that in their action on animals and in their reactions with their antibodies their effects may follow the laws of chemistry, but follow the laws of multiple proportion. In other words, the toxins do enter into the reactions and are exhausted or neutralized in doing so. On the other hand, the weight of evidence is that enzymes or ferments do not enter into the reactions caused by their presence but that they are not consumed in such reactions. For instance, the hydrolytic enzymes, such as diastase and pepsin, cause starch and protein to take up water and pass over into sugar and peptone while the enzyme itself does not enter into the reaction and is not consumed in the process. It might be stated differently as follows: An enzyme changes the tempo of a reaction which would more slowly occur without its presence, while a toxin combines with its antibody much as an acid combines with an alkali.

When a fatal dose of diphtheria toxin is injected into a susceptible animal, such as a guinea pig, there is a period of incubation during which the animal shows no marked departure from the normal. The onset of the first symptoms, such as fever, loss of appetite, and death of the animal, varies somewhat with the size of the dose, but is never less than about eight hours, even when many times the fatal dose has been used. However it should not be inferred that nothing happens during this period of incubation. The disturbance simply does not rise to the plane of gross clinical observation. The toxin begins to act soon after its introduction into the body. Within an hour or two the clinical thermometer, which is not a highly delicate indicator of changes in temperature, shows an elevation which proceeds slowly until a short time before death, when there is a progressive and rather rapid fall in temperature which may reach some degrees below normal before death. The skin about the point of injection becomes edematous and later necrotic. The interval between injection of the toxin and death is the same as after inoculation with the living organism. When sublethal doses are given there is often paralysis, beginning in the posterior extremities and proceeding over the body. The internal organs are hyperemic, with minute hemorrhages in the adrenals, stomach and intestines. Occasionally a gastric ulcer is produced. Diphtheria toxin apparently has a special avidity for nervous tissue. Whether this action is primarily central or peripheral has not been satisfactorily determined, though it is most probably the latter. When the toxin is injected into a susceptible animal it soon disappears from the blood stream and manifests its activity on certain organs and tissues. It has not been found in the urine except when massive doses have been given. In unsusceptible animals it remains for a long time in the blood stream and is of course without action on the tissues, susceptible, while rabbits are less so, and white mice practically refractory.

The toxin is a secretion of the living bacillus...
and different strains of the organism vary widely in the amount of toxin which they elaborate. There is apparently no constant and fixed relation between the virulence of a given strain of the bacillus and its toxin production. A strain isolated by Park of New York, and generally known as Park No. 8, has proved in both American and European laboratories to be a most efficient toxin producer. It was obtained from a relatively mild case of diphtheria and it has shown no great virulence as tested by the experimental inoculation of guinea pigs. With this strain filtered products have been obtained with as low a minimum lethal dose as 0.0015 cubic centimeter. However this strain sometimes fails to produce a satisfactory toxin. Through another strain Madsen once reported a toxin whose minimum lethal dose was as low as 0.0005 cubic centimeter. This is the most powerful diphtheria toxin yet reported. The cellular substance of the diphtheria bacillus contains a protein poison, as was first shown in the writer's laboratory. Against this poison diphtheria antitoxin has no neutralizing effect and it must be regarded as a pure death. A true type toxin results only when the word toxin has come to have a distinct and specific meaning. All toxins are poisons, but all poisons are not toxins. Those poisons which when injected into animals in gradually augmented doses produce antibodies are known as toxins. The serum of horses immunized to diphtheria toxin, and known as diphtheria antitoxin, is usually preserved by the addition of 0.5 per cent phenol or 0.3 per cent tricresol. For the antitoxin to be of value it must neutralize the antitoxin on account of the large size of its molecules. Heating antitoxin to from 60° to 70° C. destroys its value, but the dried antitoxin will bear a temperature of 110° C. for half an hour without injury. Diphtheria antitoxin is quite certainly a protein. It is true that it bears some resemblance to ferments. It is in and of itself perfectly harmless to the animal body. All disturbances which may result from the administration of diphtheria antitoxin are due to other constituents of the serum and may be induced by the use of the serum of a normal horse. The antitoxin may be precipitated from the serum by metallic salts as other protein constituents are, but it is not carried down mechanically as happens to the toxins and the ferments. It is more than probable that the antitoxin is a globulin. It is precipitated with this protein fraction, and the precipitated antitoxin has been prepared by this method. Unfortunately the immunity induced by diphtheria antitoxin is only temporary, lasting from three to four weeks, while one attack of diphtheria does not give immunity to another. For this reason it frequently happens that a child who has once had an immunizing dose may, a few months or possibly a few years later, need a curative dose. The fear of anaphylactic shock has led many physicians to hesitate about a "reinjection" of horse serum after an interval of 10 days or more of the bacillus and its toxins not to do this with safety. In all cases of "reinjection" after an interval of 10 days or longer one drop of the antitoxin should be administered and if no untoward symptoms follow within an hour, any amount of the serum may be injected with safety. This procedure should be adopted not only in all cases of "reinjection" but when the patient has shown at any time asthmatic symptoms. With these precautions no physician need fear to use diphtheria antitoxin in the treatment of this disease. When antitoxin is used early in the disease the extension of the membrane in the throat usually stops in a few hours. For this reason laryngeal diphtheria is now rarely seen except in neglected cases. Not only does the extension of the membrane stop on the administration of the antitoxin, but as a rule that already formed begins to recede, becomes detached and fades away.

In all civilized countries the manufacture of diphtheria antitoxin is under government control. In the United States this is one of the functions of the United States Public Health Service. No one can manufacture diphtheria antitoxin without a permit from this service and such permits are not granted until personal inspection has convinced the service of the reliability and scientific intelligence of the manufacturer. Besides this, every batch of diphtheria antitoxin prepared is tested not only by the manufacturer but in the Hygienic Laboratory at Washington, D.C. It is essential that the preparation and standardization of so valuable an agent as this should be under government control.

Tetanus, or lockjaw, is one of the most strikingly distressing and fatal diseases known. Therefore it is not strange that it is mentioned in some of the earliest medical writings. It was known to the writers of classical times that tetanus was in some way connected with working and that it was much more common in military than in civil life. Furthermore, it has long been known that the frequency of the development of tetanus does not run parallel with the extent or gravity of the wound. Indeed it is more likely to result from a trivial penetrating wound than from a large open one. The infectious nature of this disease was first demonstrated by French physicians, especially Verneuil. However the experimental transfer of tetanus was first made by two Italian physicians, in 1884. They inoculated 12 rabbits with matter taken from a pustule on a man who had tetanus. Within a few days 11 of these animals developed the disease, and from these it was transferred to other rabbits. Soon after Nicolaï induced tetanus in rabbits, guinea pigs and mice, by inserting bits of earth under the skin. This investigator also discovered the specific bacillus, but failed to separate it from associated bacteria. This was done by a Japanese bacteriologist, Kitasato. The tetanus bacillus develops spores which are highly resistant to heat and other adverse agents and may retain their vitality quite indefinitely. In some localities 100 per cent of rabbits inoculated with the soil develop this disease. As a rule the spores are most abundant in filthy soil, especially that richly impregnated with horse manure. Before the days of aseptic surgery tetanus was especially prone to follow operative procedures, as was one man, who, after being operated upon by a great surgeon, and many other operators both in the field and in hospitals. Among certain primitive dirty people tetanus of the newly born is frequent on account of the methods of cutting and elevating the cord. On certain islands, as Réunion and Cayenne, the infantile
rate from this cause has in some years

air should be excluded. According to Kitasato,
exposure to sunlight completely destroys the
toxin within from 15 to 18 hours. Other
vestigators have reported the time to be only
half of this. Oxidizing agents such as dilute
solutions of potassium permanganate, mineral
and vegetable acids, destroy it promptly. From
its solution in the filtered cultures tetanus toxin
is thrown down on the addition of ammonium
sulphate, and by dialysis and evaporation in
vacuo it can be obtained in dry form, not pure
but mixed with the proteins carried down
it with the reagent. The purest preparations
yet made still give the protein reactions and
there are those who claim that the toxin is an
albumose, but this does not necessarily follow.
According to Brieger and Cohn, the fatal dose
for a mouse is about 0.0000005 gram and for a
man, about 0.00023 gram. It requires 2,000
times as much of the poison per kilo of body-weight
to kill a rabbit as it does to kill a horse, and the
chicken is 100 times less susceptible than the
rabbit. It is highly poisonous when introduced sub-
cutananeously or intravenously, but is most
potent when administered subcutaneously and
tradrubercularily. This is due to the fact that it
has a predilection for nervous tissues. It has
been shown quite conclusively that when in-
fected subcutaneously the toxin is conveyed
to the nerve centres through the axis cylinders
of the motor nerves, and that symptoms of
tetanus first develop when the anterior horns
of the spinal cord are reached. This explains
why there is always a period of incubation,
both after subcutaneous injection of the toxin
and as a result of wound infection with the
bacillus. It also makes plain the observation
so frequently recorded that the period of incuba-
tion is shorter the nearer the site of in-
oculation is to the central nervous system.
That tetanus toxin does combine with certain
constituents of the central nervous system was
demonstrated some years ago by Wassermann
who found that when the toxin is rubbed up in
a mortar with brain or spinal cord tissue it
is completely fixed and neutralized. In other
words, it forms a compound with some con-
stituent of this tissue. This is probably what
happens when the poison is generated by the
bacillus in the animal body and as a result of the
injury thus caused to the nervous tissue
tetanic spasms occur. The tetanus antitoxin is
prepared in a manner similar to that employed
in the preparation of diphtheria antitoxin.
Unfortunately, however, the brilliant practical re-
ults obtained in the treatment of diphtheria
have not been secured in the treatment of
tetanus. The value of tetanus antitoxin as a
protective agent has been recognized for many
years and has been fully confirmed in the
treatment of the wounds of the World's War.
Before the United States entered the War,
American laboratories were busy supplying the
armies of the Allies with this material. Sol-
diers received a protective dose before they
went into battle and all wounded were treated
with this agent as soon as possible. In this
way a high death rate from tetanus has been
avoided, notwithstanding the fact that a large
proportion of the wounds are infected with the
bacillus. If one waits until symptoms of
tetanus have developed the administration of
the serum fails in a large proportion of cases
in effect a cure. However, even under
this condition the treatment is not wholly without value. The cessation of trench warfare was followed by a notable decrease in the number of cases infected with the organism of this disease.

In certain parts of Germany, especially in Württemberg and neighboring parts of Baden and Bavaria, where sausage, a favorite article of diet, has been improperly cured and eaten raw, poisoning from this article of food has long been known. Rarely, similar cases have occurred among those in the United States who persisted in the Old World method of preparing and eating sausage. As a rule, food which produces this form of intoxication has been prepared for a long time before it is eaten. The disease thus produced is known as botulism and it should be clearly understood that this does not include the ordinary form of food poisoning which leads to vomiting and purging and generally ends in recovery. In 1885, some 30 cases of botulism developed in a small Belgian village and were studied by Van Ermengem of Ghent. In this instance, the food was a ham which had been boiled in brine. It was from a sound animal, other portions of which had been eaten while fresh without harm. In fact the companion ham, from the same brine, had been eaten without disturbing those who had partaken of it. The sound ham lay near the surface and was not wholly covered by the brine while the faulty piece lay on the bottom of the vat and was completely excluded from the air. It was not noticeably decomposed, but was marked by so-called "spotted" areas and gave off butyric acid. In this meat the bacillus botulinus was found. An aqueous extract of the ham was injected into animals and proved to be intensely poisonous. In cats it caused dilatation at animal temperature, but at lower temperatures and when the air is excluded it develops its toxin. It will be seen that it does not cause an infection but an intoxication. Indeed, the bacillus does not multiply in the animal body, to a slight extent. It is a toxigenic, rather than a pathogenic, organism. A striking characteristic of this toxin is that it affects some animals, including man, when taken by the mouth. It also has a predilection for nervous tissue. According to Marinexco and others, it induces in the blood cells of the anterior horns, leading to chromatolysis, and disintegration of Nissl's granules. Like tetanus toxin, it combines in vitro with nervous tissue, forming an inert compound. An effective antitoxin has been prepared and has proved efficient in animal experimentation. The writer is not aware that this antitoxin has been used in the treatment of botulism in man. The toxin may occur in canned vegetables as well as in meats. There was quite a scare in the United States in 1917 concerning the possibility of botulism being widely prevalent on account of the new methods of preserving food proposed at that time by the Agricultural Department. This scare has been greatly reduced by subsequent events. Apparently the bacillus botulinus is not widely distributed. So far it has been found only once except in food and that was in the faces of hogs. As has been stated, it grows only in the absence of air or in association with other organisms which consume the air, and it has been found in canned foods. In such, it produces gas which bulges the ends of the can and food from such containers should not be eaten. In brine of more than 10 per cent strength it will not grow. It is of special interest because it is essentially a saprophytic organism producing in food in the absence of air a most potent poison which affects man when taken into the stomach.

Reference keys in diet have been found. Reference keys to the fact that the toxins were first found in the venom of snakes. Antitoxins to these venoms have been prepared, their value demonstrated experimentally on animals, and some slight use of these preparations have been made in the treatment of men bitten by poisonous snakes in India. However, these antitoxins like all others are strictly specific and an antitoxin must be prepared for the venom of each species of poisonous snake. The rarity of death from the cause in most parts of the world and the difficulty of preparing and keeping on hand an antitoxin for the treatment of the bite of each species limits the use of this preparation. Within recent years an antitoxin has been prepared and used successfully in the treatment of cerebrospinal meningitis. In this instance a definite amount of fluid is withdrawn by puncture under aseptic precautions from the spinal canal and is replaced by the injection of the antitoxin. Furthermore, it has been demonstrated in our own camps during the war that the intravenous injection of this antitoxin is beneficial.

Scientific investigations and extensive studies on animals have given to man absolute control of diarrheal and enteric diseases as typhoid fever and its Tuberculosis, formerly known as the "C" of the Hosts of Death, has been greatly reduced.

In the Rockefeller Institute there has been prepared a serum for the treatment of all forms of pneumonias recently induced by staphylococci groups may cause. Animals have been immunized to this organism and the sera of such animals have been used in the cure of this disease. However, it is not certain at present that such sera have true antitoxic values. Some claim that the sera of animals immunized with this type of pneumo-
TOXODON — TOYS

737

coccus have a bactericidal action, while others think that they only render phagocytic action more effective. In order to be of service in the treatment of pneumonia due to pneumococcus Type I, a relatively large amount of the serum must be used. In other words, a certain degree of concentration must be reached. The law of multiple proportion which holds good between diphtheria toxin and its antitoxin fails here. Our experience in the World War has demonstrated the great destructiveness of the pneumonias and the lesson that we have learned should lead to the greatest effort toward the discovery of both preventive and curative measures in these diseases. On the battlefields of France the gas bacillus, known also as the Welch bacillus, proved a most distressing and destructive agent. Shortly before the war closed Bull and Fritchett at the Rockefeller Institute discovered an antitoxin for the poisons of this organism and fully demonstrated its value in experimental animals. The cessation of trench warfare led to a rapid reduction in the number of wounds infected by this organism and the time has not yet come for a correct estimate of the practical value of the antitoxin. See IMMUNITY; MEDICAL SCIENCE AND THE WORLD WAR; SERUM THERAPY.

TOXODON, a genus of large Pleistocene mammals whose complete remains are found in the Paleozoic formations of Argentina. They were about the size of a hippopotamus; the teeth consist of large incisors, very small lower canines and strongly-curved molars, all with persistent roots. According to Cope, the tarsal bones more nearly resemble those of the Proboscidea than any other known ungulates. With a smaller genus, Nesodom, it constitutes the sub-order Toxodontia.

TOY, Crawford Howell, American Oriental scholar; b. Norfolk, Va., 23 March 1836; d. Cambridge, Mass., 12 May 1919. He was graduated at the University of Virginia in 1855, studied in Berlin (1860-68), and became professor of Hebrew in the Southern Baptist Theological Seminary in 1869 and professor of Hebrew and other Oriental languages and lecturer on biblical literature at Harvard in 1880. From 1899 until his death he was professor emeritus. His published works include 'The Religion of Israel' (1882); 'Quotations from the Old Testament in the new Testament' (1884); 'Judaism and Christianity, a Sketch of the Progress of Thought from Old Testament to New Testament' (1890); 'Hebrew Text and English Translation of Ezekiel' (1899); 'Commentary on Proverbs' (1899); 'Introduction to the History of Religion' (1913), and others.

TOYAMA, to-yā-mā', Japan, the capital of the prefecture of Toyama, situated near the head of Toyama Bay, west coast of Nippon, 170 miles northwest of Tokio. It has considerable trade in drugs and leather. Pop. of the city about 64,822; of the prefecture, 829,596.

TOYBEE, to'īn-be, Arnold, English social economist and philosopher; b. London, 23 Aug. 1852; d. London, 9 March 1883. He was interested in various movements of popular re-
form and the betterment of the laboring classes. Though called a socialist, he was certainly a conservative one and vigorously opposed in two lectures the doctrines of the 'Progress and Poverty' (1880) of Henry George (q.v.). Toynbee Hall in Whitechapel, London, was established in his memory in January 1885 and was the first "universal settlement." His writings were posthumously collected as 'The Industrial Revolution' (1884; 4th enlarged ed., 1894). Consult Montague, 'Life' (Johns Hopkins historical series, 1889); Milner, 'Arnold Toynbee: a Reminiscence' (1895).

TOYBEE HALL, a social settlement, the first in the world, founded by Canon S. A. Barnett in memory of Arnold Toynbee, who, while a student at Oxford became interested in the White Chapel district poor. The settlement was opened in 1884 and was a success from the start, gradually becoming a centre of educational and social endeavor and rallying to its work many of the leading young men of the time. Consult Gell, Philip L., 'Account of the Work of Toynbee Hall in East London' (Baltimore 1889). See SOCIAL AND UNIVERSITY SETTLEMENTS.

TOYS, American Manufacture of. To tell the story of the art of toy-making from its earliest days it would be necessary to follow the industry back through many centuries, for the archaeologists, in delving among the tombs of ancient Greece and Egypt, have made the surprising discovery that children played with dolls—and jointed dolls at that—more than 5,000 years ago. Moreover, by the side of these dolls the scientists have unearthed other playthings that children still crave: dolls' furniture, the utensils for cooking and for keeping shop, and, what is perhaps more interesting from the point of view of the antiquarian, the articles used by the priests in making the sacrifices, cleverly duplicated in miniature, showing that the children of those times also played at having religious exercises for the benefit of their doll's soul.

Scientists now claim that the custom of playing with dolls is one that is practically as old as the world itself, and that they base their assumption upon the theory that playthings are always and always have been just as necessary a constituent of human health and development as either food or medicine. The most eminent modern psychologists support this theory. They claim that the reason why children crave toys is that their nature requires them, and that to deprive them of such playthings is to retard their mental growth and development.

Vol. 26—47
In spite of the early origin of toys the progress in the manufacture of playthings was so slow that even as late as 100 years ago they were few in number, simple of construction and extremely costly, especially in the United States. At that time no such articles were systematically manufactured in this country, and as the cost of importation added materially to the price, there were comparatively few persons who were financially able to purchase such puppets for their little ones. Instead, the children of those days accepted more primitive playthings — dolls that were often not dolls at all, but pieces of cloth, either folded and pinned in such manner as to suggest the "shape" that was not there, or with head and bust stuffed hard with sawdust, the features being indicated by pen and ink drawing. In addition to these dolls there were a few other toys that could be purchased for children, but hoops, jumping-rope, ten-pins, marbles, jack-in-the-box, the battledoor and shuttlecock, a few simple games, some roughly illustrated books, alphabet blocks, etc., represented the limit of the toy-sellers' stock.

In America is concerned the toy-making industry is of so recent an origin that it can scarcely be said to have a history. Before 1875 more than 90 per cent of the toys sold in this country were of foreign manufacture, and we have made no attempt to export such few articles as we did make into other countries. To-day, on the other hand, scarcely 5 per cent of the toys we sell are made abroad, while our exports are increasing rapidly.

To obtain anything like an accurate idea of the great progress that this nation has made in the art of toy-making it is necessary to remember that up to about 1875 there was not a doll factory in the United States, and that such other toys as were manufactured in American turning mills were cheap in quality and unprepossessing in appearance. When the American manufacturers began to make toys, about a quarter of a century ago, they found that it would be extremely difficult for them to compete successfully with the foreign toy-makers in the field in which they had been so long. In the first place material was cheaper in Europe, and there could be no comparison between the comparatively good wages paid to workmen in this country and the miserable pitance allowed in those German and Swiss villages where the entire population was held under contract to produce such goods at prices that barely enabled them to keep body and soul together. To overcome this difficulty American inventive genius was called into play, with the result that the local manufacturers not only established many new lines of toy specialties but that they evolved countless ingenious contrivances that the foreign producer has never dreamed of making.

Thus we still import some dainty toys from France and Switzerland, nearly all the newest and most unique productions are now made in America.

Simple toys are made mostly of wood and metal, using the same principles employed by mechanical engineers in the making of delicate machinery. The design has been decided on and reduced to its most simple elements, gigs are fashioned so that each piece is a duplicate of every other piece, and the construction is pushed through on the American factory system. Many toys are really model machines, as steam-engines, locomotives, cars, carriages, fire-engines, automobiles, tanks, etc.; others are mere figures or puppets, as the Noah’s ark men, wooden soldiers and the like; others are miniatures of common household articles, as chairs, tables, plates, cups, spoons, etc., assured to be proper for the furnishing of a doll’s house. Others are very elaborate and costly as a goat’s carriage, peddle mobiles, working locomotives, contractors’ machinery, imitation large figures of elephants, dogs and Teddy bears, hobby horses, etc. Some single toys in playthings sell at retail between $1.00 and $20.00, which is not considered extravagant by the rich.

The United States census compiles together the manufacturers of toys and games. It is not possible wholly to separate the two, but it appears that there were in 1914 about 200 establishments wholly devoted to toy-making, and as many more partly devoted to the industry, which gives employment to about 5,000 persons, with annual products valued at $8,000,000.

TRACERY, in architecture, permanent openwork in a window, the top of a doorway, etc., characterized by geometric and ornamental management of the prominent lines of the design. It is common in the cathedral structures of Europe, especially in the older French and Italian structures. The term is extended to similar decorative work of a conventional character, as on a dado or ceiling decoration.

TRACHEA, trä’kē-ə or trā’kē-ə, or WIND-PIPE, the principal air-passage of the body; a tube extending from the larynx to a point opposite the third dorsal vertebra, where the tube divides into two chief divisions or bronchi, one of which supplies each lung with the air necessary for respiration or breathing. The trachea is of cylindrical form and is both membranous and cartilaginous in its structure. Its length is about four and one-half inches and its diameter from three-fourths inch to one inch; that of the male being larger than that of the female. The front or anterior surface of the organ is convex and is covered in the chest by a thick layer of fat about the ishmus of the thyroid gland, the inferior thyroid veins, the sternohyoid and sternothyroid muscles, the first part of the sternum, the arch of the aorta, etc. The trachea rests on the gullet or esophagus, while in the chest it is situated between the pleura or membranes lining the thorax and has the pneumogastric nerve on each side. The trachea is composed of rings or zones of a gristy or cartilaginous nature, known as the cartilages of the trachea. It rests on the gullet or esophagus, while each cartilage forms an imperfect ring, being unenclosed behind and having the gristy edges merely joined by fibrous membrane. The cartilages are separated from each other and also connected together by narrow bands of fibrous tissue. The first cartilage of the trachea is broader than the others and may be divided at one extremity, while the last cartilage is thick in the middle and curved backward at the point where the trachea divides into the two bronchi. Sometimes two of the cartilages may be united. The muscular fibres of the trachea exist in longitudinal and transverse layers and are composed of unstriped or non- striated fibres. (See Muscu-
TRACHEOTOMY—TRACT SOCIETIES

The trachea itself is lined by a mucous membrane, which is covered with ciliated cells provided with delicate vibratile cilia or cilia. The trachea derives its blood supply from the inferior thyroid arteries. Its nerves come from the pneumogastroneous trunks and cervical sympathetic ganglia.

Foreign bodies falling into the trachea usually enter the right bronchus, because of the larger size of the latter and because the more oblique position of the left

Intracranial and Injuries of the Trachea.-Achea is liable to inflammation and its contents and frequently suffers from extension of disease from the larynx. Acute inflammation may occur as an idiopathic affection or as a complication of other disease, as smallpox, measles, tuberculosis, whooping cough, and may extend to the submucous and cartilaginous structures, giving rise to ulceration, cicatrisation and stricture. Effusion in the larynx and the application of the application of steam may result in the larynx. The inhalation of steam may cause laryngeal edema and the administration of antiphlogistic remedies. Constriction of the trachea due to a foreign body or other causes pressing against the trachea; or the symptoms produced by pressure on the nervous system.

Foreign bodies occasionally pass through the larynx into the trachea and the accident is a formidable, which not infrequently proves fatal. Accidental death occurs most frequently among children and is caused by a sudden inhalation of a foreign body, something in the mouth. Occurrence, however, a foreign body may, during swallowing and without an inhalation under the epiglottis and into the upper larynx. Foreign bodies in the windpipe are arrested above the rima glottidis, in the vocal cords, in the cavity of the oropharynx or in the trachea. In such cases the patient is suddenly seized with convulsive coughing. The speech is more or less affected and the breathing is whistling or stridor; but the diagnosis rests mainly on the presence of the symptoms. When the foreign body is made out, it is to be removed at once.

When the body is in the trachea, a free opening lower be at once made and the opening be either longitudinal or transverse. It is advisable to insert in nearly all cases to the trachea, as, by securing a free aperior or respiration, spasm of the glottis is avoided, and the foreign body may be removed through the artificial opening, or it may fall into the mouth. Fracture of the cartilage from direct violence and in cases the wounded part should be left open, so as to secure the passage of air to the lungs. Union of the wound by sutures is avoided, that by suppurative inflammation. Foreign bodies in the trachea and all kinds of injury from external violence are serious affections, as disease of the lungs is apt to be induced.

The term trachea as applied in respect to invertebrates connote a more or less complicated arrangement of air-tubes and spiracles (q.v.), most fully developed in insects and constituting the respiratory system. See INSECT; see ANATOMY; LUNGS; NOSE AND THROAT; RESPIRATION.

TRACHEOTOMY. See Nose and Throat.

TRACHOMA. See Ophthalmia.

TRACHYTE, trak'te, an igneous or pyrogenic rock of the effusive type and consisting of a ground mass of slender hair-like crystals of orthoelastic feldspar and ferro-magnesian silicates (hornblende or augite) and generally phenocrysts of sandine feldspar. It differs from rhyolite chiefly in the absence of quartz. Trachyte occurs in the Black Hills, in Custer County, Colo., in Montana, along the river Rhine, where the Drachenfels furnishes the most typical variety, in the Auvergne, in Italy, and in the Azores. The compact pre-Tertiary varieties are classed as felsites (q.v.) or porphyries.

TRACING PAPER, transparent paper which enables a drawing or print to be clearly seen through it when laid on the drawing, so that a pen or pencil may be used in tracing the outlines of the original. It is prepared from smooth, unsized, white paper rendered transparent by an oil application, as of oil of turpentine with an equal part of Canada balsam, nut-oil, etc.

TRACT NUMBER 90. See TRACTS FOR THE TIMES.

TRACT SOCIETIES. The circulation of religious appeals in writing preceded the invention of printing and was used by Wycliff and other reformers at times and places when and where open preaching might have been too perilous. The press was able to multiply such appeals and it was largely used for this purpose in the religious controversies of the 16th and 17th centuries. The 17th century and the beginning of the 18th witnessed the organization of several societies within the Church of England for promoting Christian knowledge and the dispersion both at home and abroad of Bibles and tracts of religion.

It was not, however, until 1750 that members of different Protestant denominations united in London to form the "Society for Promoting Religious Knowledge Among the Poor." This and other societies with a similar object circulated many religious books and tracts.

In the United States the Methodist Book Concern, established in Philadelphia, issued its first publication in 1789, and removed to New York in 1804. In 1822 a bindery was established and in 1824 a printing office was added. The division of the Methodist Church on the slavery issue led to the establishment of a separate book concern at Nashville, Tenn., by the Methodist Episcopal Church South. The publications of the Book Concern are of three classes—first, the bound volumes, denominational papers and some pamphlets; second, those of the Methodist Episcopal Sunday School Union, and third, those of the Episcopal Tract Society. The Concern has developed far beyond the "tract society," being now a
large religious publishing house. The salaries of bishops and other expenses of the Methodist Episcopal Church are paid out of the profits of the Book Concern.

The American Tract Society was founded in the spring of 1825. In this society Christians of different Protestant denominations united to publish and circulate “whatever would best diffuse a knowledge of our Lord Jesus Christ as the redeemer of sinners and promote the interests of vital godliness and sound morality,” the material circulated to be such as would receive the approbation of all evangelical Christians. The society established a system of colportage, gave wide circulation to tracts and sought to place Christian literature in every family. Periodicals were established for young and old and the needs of the large foreign population were met by religious publications in their own languages. The society has contributed from its earnings nearly $1,000,000 to assist missionaries abroad in printing books approved by the society. Donations and legacies the society has received over $7,000,000 and has expended that amount in its gratuitous work, besides printing and circulating over 800,000 tracts, pamphlets, books and periodicals, many of which were sold. Among the nationalities reached in their own languages by publications of the American Tract Society are the Swedish, Danish, French, Spanish, Dutch, Italian, Portuguese, Polish, Bohemian, Hebrew, German-Hebrew, Hungarian, Lithuanian, Finnish, Welsh and Armenian. It has furnished religious reading matter to the American soldiers in large quantities. Besides the American Tract Society, every important denomination has an organization for the circulation of its denominational literature.

TRACTARIANISM, the name usually given to a system of religious opinion and practice promulgated within the Church of England in a series of papers published under the title of ‘Tracts for the Times,’ between September 1833 and March 1841. The immediate object of the movement was to secure the admission of a large number of nominal adherents of the Church of England from their apathy, by awakening their interest in what the writers conceived to be the distinctive principles of that Church. For this end, the refugees from the Roman Catholic Church, the German, and the French Protestant creeds were the subjects of special attention. It was not until the development of dynamo-electric power, and the experience so gained, that the practical application of the system to the purposes of cultivating and maintaining the loyalty of the converts to the Church of England from the Roman Catholic Church, the German, and the French Protestant creeds was possible. After that, electric machinery had improved before electricity could compete with the existing means of traction. Among the leaders in this movement were J. H. Newman, John Keble and E. B. Pusey, and they were assisted by not a few of the writers of the Tracts for the Times, who, while suppressing the revolutionary doctrine of the Tractarians, did not rest content with the narrow limits of their own creed. The Tractarians believed in the truth of the old religion, and the maintenance of spiritual unity with the Church of Rome, and the restoration of the visible unity of the Church, as the only way to secure the establishment of the true religion and the salvation of mankind.

TRACTATION, Electric. The development of electric traction was started with experiments on a small scale, involving no practical outcome, followed by failures on a larger scale, showing the possibility of the system, and finally by success and the practical application of the system to the purposes of transportation. It was not until the development of dynamo-electric power made it possible to obtain electrical energy at reasonable cost that the practical application of electric traction became possible. After that, electric machinery had improved before electricity could compete with the existing means of traction. Among the leaders in this movement were J. H. Newman, John Keble and E. B. Pusey, and they were assisted by a few of the writers of the Tracts for the Times, who, while suppressing the revolutionary doctrine of the Tractarians, did not rest content with the narrow limits of their own creed. The Tractarians believed in the truth of the old religion, and the maintenance of spiritual unity with the Church of Rome, as the only way to secure the establishment of the true religion and the salvation of mankind.
the development of electric roads in the United States has been rapid. At first horse tramways were equipped to operate by electric trolley roads, then the tramways were extended further to the suburbs and surrounding towns, and towns were connected by interurban roads equipped electrically, runned at the Sprague speed and starting and stopping on steam locomotives. For city train service on elevated roads, the substitution of electricity has taken a longer time, as the steam locomotives were efficient and as the changes involved an expenditure which would not have been advisable unless decided advantages with respect to service and cost of operation were shown.

Direct-current Railway Motors.—On all the electric roads in this country, and on a large proportion of those abroad, direct-current motors are used for traction. These motors are of the series type, and are usually connected to the axle through a single spur gearing. The characteristics of the direct-current series motor are admirably adapted to traction work. The speed is dependent upon the tractive effort, and the motor slows down when the tractive effort increases, having something of the effect of a variable speed gear; this is very important in practical railway work, for if the motors ran at a constant speed, the energy demanded on grades would be greatly exaggerated and much larger motors would be required. It is also true that this type of motor gives a greater flexibility to the system, as far as the speed is concerned, and this flexibility is important in practical work. To show the difference between a series motor and a shunt motor, suppose the track resistance is 10 pounds per ton weight of the car; then if the speed were constant (as would be the case with a shunt motor), the power required on a 5 per cent grade would be 11 times as much as on a level—air resistance being omitted—while with a series motor it would be only three or four times as much.

It might be well to briefly trace the development of electric railroad motors in the United States. The motors used by Sprague in the equipment of the Richmond road had too small a variable resistance and the work was burned out. They were two-pole machines, of a rated capacity of 7.5 horse power, and at first drove the axle through a single reduction gearing; the work, however, was so heavy that it was found necessary to change to a double reduction gearing, the teeth of the pinion stripping on the heaviest grades. These motors were unprotected from moisture and from the dust and dirt of the streets. The methods of suspending the motor and some of the details of the regulation are still retained. The field magnets of the motor were sleeved on the axle, thus centering the armature on the axle and allowing a satisfactory relation between the two. The brushes had no drag, the commutator, which was soon abandoned, as it greatly increased commutator troubles, which were at that time serious. The brushes first used on these motors were of copper and a number of forms were experimented on, it being necessary to remove the motor with the brushes completely, which was a serious drawback. None of the experiments with copper brushes were successful, and it was not until the introduction of the carbon brush by the Thomson-Houston Company that the commutator difficulties were largely obviated.

Soon after the Sprague Company entered the railway field, the Thomson-Houston and Westinghouse companies took up electric railway work, and greatly aided its development by adding their immense resources to the resources of the Sprague. The development of street railway apparatus was rapid. The first motors of all the companies used double reduction gearing, and one of the first improvements, after the introduction of the carbon brush, was the design of a comparatively slow-speed motor which allowed a single reduction gearing to be used. The first motor of this kind was made by the Wenstrom Company, and within a short time other manufacturers were making slow-speed motors—some going so far as to attempt gearless motors; the latter, however, were not successful owing to their great weight and lack of efficiency at reasonable speed. Most of the slow-speed motors that were made at this time were not thoroughly enclosed, their efficiency being such that in the ventilation than could be obtained by a totally enclosed machine was necessary. The machines were, as a rule, of the four-pole type, with parallel armature windings, requiring four brushes and causing, under certain conditions, unbalancing in the circuits which greatly increased the armature losses and decreased the efficiency. The next step in motor development was made by the Westinghouse Company in what they called their No. 3 motors, a machine much like those at present in use. It had four poles, each of them provided with a field coil, while the armature was provided with what is called a series winding, necessitating only two brushes and doing away with the unbalanced armature circuits of the earlier machines. This type, with the modifications suggested by experience, is the one used in this country at the present time, and almost universally used abroad.

Controllers.—The first method used for regulating railway motors was by inserting resistance in the circuit of the machine; this was modified and developed until, in the Richmond motors of the Sprague Company, the series-parallel system was used, combined with a variable resistance obtained by the use of various combinations of the coils into which the field windings of the machine were divided. On starting and for slow speeds the two motors were used in series, while for the higher speeds they were placed in parallel. This system was abandoned, and for some years a parallel system for operating two motors on a street car was used. One difficulty found in the early series-parallel control was the liability of the motors to slip when in series position. The slipping on one pair of wheels would allow the motor connected to these wheels to revolve at such a high speed that its counter-electromotive force would cut off the power from the other, and the car would won the motor which had the least resistance, which always exists, but which is not of importance on ordinary roads, was further complicated by the electrical difficulties in the controller—the method of control not being as efficient as that used at present. In the Sprague system, there was no resistance outside of the motors, but the motor fields were divided into a number of coils, and the relations of these coils were varied, giving first a high resistance
and a very strong field for a given current, and afterward a comparatively low resistance and a comparatively weak field. The difficulty of this system lay in the fact that all the heating incidental to the heating of the motors on starting was liberated in the field; and, further, the inductance of the fields was greatest at the breaking of the circuit, when all the coils were in series. The Thomson-Houston Company overcame this by placing a variable resistance directly in the motor circuit, the resistance being regulated by a movable contact arm, controlled by the motorman. This gave better results than the Sprague system, but it also lacked efficiency. In 1891 the General Electric Company brought out a series-parallel controller, similar in some respects to the early Sprague control, but differing from it in the fact that the regulating resistances were not obtained by variations of the different motor field windings, but by resistances outside of the motor. This system, with variations due to different conditions of operation, is still used and gives excellent results. Perhaps the most important development in controller work was due to the introduction of the automatic dynamometer card by Prof. Elihu Thomson. This apparatus is so placed as to control the breaking of the circuits, and almost entirely eliminates the destructive effects of sparking, due to the breaking. The method of operation is as follows: At first the two motors are placed in series, the resistance being also in series with them; then the resistance is gradually cut out, until finally the motors are in series across the line with no outside resistance in their circuits. Then the resistance is again cut in and one of the motors is short-circuited; the next operation cuts out the short-circuited motor, the next places it in parallel with the other motor, a large part of the resistance still being in series with them; the rest of the operations consist in cutting out the resistances until finally the motors are in parallel across the line. The shifting of the circuits, due to the various operations necessary for regulation and cross-circuiting, is carefully standardized against the different sections in compartments.

Multiple-unit System of Control.—In urban train service, where a number of cars are operated in one train, with frequent stops, the question of acceleration is of the utmost importance. In order to accelerate quickly, it is necessary to have a large margin of tractive effort on the train—that is, it is necessary to have a large proportion of the total weight of the train on the driving wheels. When the question of displacing steam locomotives for elevated railway service first came up, and was attacked on the basis of using electric locomotives, the advantages of the latter were not apparent. There was, of course, some advantage in the matter of expense, but not enough to justify the expenditure necessary to change from steam to electric service. Mr. Sprague devised a system by which a number of cars on a train could be equipped with electric motors and controlled from any one of them; this also he called the *multiple-unit* system. At first it was opposed by most of the manufacturing companies and by many electrical engineers. With his customary energy, however, Mr. Sprague worked his system into practical form, and to-day all trains operated by electricity employ his fundamental methods. The advanced system are these: It gives a large portion of the total weight of the train on wheels, and at the same time distributes the weight of the motors over the whole length of the train, this in the first place, this allows rapid acceleration without slipping of the wheels, and on the engine, it does not impose an undue load on any elevated structure. It is also true, to change the number of cars in a train without changing the relative power of the driving mechanism of the car. It more utilizes all the train space for the accommodation of the passengers. Its range, compared with a single locomotive, in the fact that it necessitates a greater number of motors, thus adding to the cost of the locomotive, but it greatly reduces the cost of the system of control.

In the Sprague system each car is with a controlling device operated by a motor, the motor being operated through a circuit controlled by the motorman. To a considerable extent automatic, at which the different positions of the controller on the car are regulated by the flow of current into the motors, determined by the motorman. This important feature of the apparatus and its uniformity, and at a rate of greatest simplicity. The General method of control is somewhat different, this each car having a master-control, much like the ordinary tramway controller, the speed at which the current is through the motors being determined by the rate at which the motorman turns the handle of the controller. In the Westinghouse control paratus which supplies current to a number of cars, the pneumatic system being worked by a local circuit, which has as a source of pneumatic power and accelerated by a master-controller on the train. This makes the operation of the line current and gives very fine action against the different sections in compartments.

Overhead Trolley System.—For the operation of electric cars, a number of devices were used, until finally Sprague at Richmond fixed a type of controller that he afterward introduced to the country and is largely used abroad. Usually determined by experiments, it is possible that a moving contact device is necessary to supply current to the cars without such a device and heating that it would be impossible. The first experiments on electric railway current was collected from the rails; it was collected through small carriages on the overhead wire, and finally it drove into a rotating wheel having a single spring about it. This is the *trolley wheel*. It is called a *trolley wheel*. It is usually called a *trolley*. It is a wire bent into the shape of a circle and against the underside of the trolley wheel. This is the usual arrangement. This is a considerable extent abroad and gives over the trolley wheel country. A number of modifications of these systems have been devised, and the overhead trolley wires, from which...
current is collected, are usually of copper; they are either suspended from insulators fastened to a span wire between poles on the two sides of the track, or from brackets fastened to a pole and projecting over the track. In this country they are almost universally placed over the centre of the track, but abroad they are sometimes placed on the side of the road, the trolley being so constructed as to make a side-bearing contact.

Underground Trolleys.—From the earliest application of electricity to railways, attempts were made to do away with the overhead wires, used in the ordinary trolley systems. Conduits having a slot through which a current-collecting device could pass were placed beside the tracks or between the rails; conductors were placed in these conduits and the collecting devices on the cars were made to bear against the conductors. At first the conduits were not large enough, not enough space was given for insulation, and the results were unsatisfactory. The first successful system to be installed was a tramway at Budapest, designed by the Siemens Company. Here the conduit was on the side of the track, the power plants. The conductor was supported from below by insulators and the system was constructed on a larger scale than had been previously employed—the details were carefully worked out and the road has operated successfully from the time of its installation. In the meantime, in this country, the necessity of some such system in the cities of New York and Washington, where overhead wires were not permitted, had forced the different electrical companies to take up seriously the question of conduit construction, with the result that successful systems were worked out for both Washington and New York, the systems being practically the same. The slot in these systems is in the middle of the track. The conduit is constructed as follows: Cast-iron yokes supporting the tramrail and slot rail are placed at intervals of five feet, the rails are attached to the yokes and the whole structure is blocked up in its proper position; then sheet steel is placed upon the yokes, forming the proper dimensions, and concrete is packed around the yokes and the forms, supporting the structure in its proper position and forming a tunnel for the conductor rails. The steel forms are made of T-iron, held from above by porcelain insulators placed in cast-iron boxes along the track. The details of the different systems that have been installed vary, but the above is practically the standard type of construction.

The current for the car is collected by means of what is known as the plow, which passes through the slot and has two cast-iron contact shoes held against the conductor rail by springs; the rail is supported on cross-arms over the car and has a wide limit of lateral motion. It is usual to place ducts beside the track, these ducts containing the feed wires that are connected at various intervals with the conducting rail.

Generation and Distribution of Current.—In the earlier roads, and, in fact, in many of the roads now operated in this country, the current for the motors is obtained from direct-current machines, having a voltage of between 400 and 500 volts. It is usual, as a rule, compounded so that their voltage increases with an increase of load. There were two reasons for this: One is that the increased voltage compensates to a certain extent for the loss of voltage in the distributing system; the other, and most important reason, is that the strengthening of the field prevents the sparking that might otherwise be caused by the armature reactions. It is the custom to ground the negative side of the machines and connect the trolley wires through what is called a feed wire® to the positive brushes. The feed wire is then carried along the line, connected at intervals to the trolley wires, it being usually the custom to divide the road into sections and feed the different sections from different feed wires. At the voltage which has been adopted as the standard—that is, from 500 to 600 volts—the economical distribution when the service is heavy is limited, and if a direct-current system is to be employed for a large area, a number of stations must be installed. For this reason, when the distances are great, it is sometimes necessary to employ a high potential alternating system, reducing it to a 500-volt continuous-current system at centres of distribution called sub-stations. On interurban lines, where the distances are great compared with the number of units in operation, this method becomes imperative, as otherwise the variations of load on the central station would be excessive, and the cost of power would be practically prohibitive. This method of operation may be described as follows: The central station, located at some point where the greatest economy of operation can be obtained, generates alternating currents at a high potential; these alternating currents are taken to the sub-stations, situated at reasonable distances from one another along the line, and are there changed to alternating currents of lower potential by means of transformers and then converted into direct currents of the proper potential by means of rotary converters. In this way a large area can be supplied from one central station and a comparatively large number of units can be operated at one time from this station, thus reducing the number of sub-stations and the sub-stations themselves, there is, of course, a fluctuating load and it is the custom to install storage batteries in connection with the rotary converters to equalize the load; the battery storing energy when the load is light and giving it out when the load is heavy.

The Return Circuit and Electrolysis.—In most of the overhead traction systems, the current passing through the motors goes through the wheels of the car to the rails, and then returns to the station, *bus bars* finally appearing at the negative brushes of the rails. When a system is operated in this way, the rails are bonded—that is, two adjacent rails are connected by conductors securely attached to the rails and giving a low resistance to the electric current. If the bonding is good, a considerable part of the current passes along the rails while a small portion strays through the earth to other conductors, such as water pipes and gas mains, using these as a return conductor. If the bonding is bad, however, a considerable portion of the return current is carried by the underground pipes, causing them at times serious injury. For this reason and also because of the fact that low conductivity in a rail return causes loss of energy, it is of
importance that the bonding of the rails should be as thoroughly perfected as possible; it should also be carefully inspected at intervals, as the bonds are liable to break and produce a high resistance between the adjoining rails, thus diverting a considerable amount of current to the underground pipes. The matter of the electric traction system has received little attention during the first two or three years of electric railroad development; the effect, however, naturally increased with time and the development of the systems until the serious damage that occurred became evident, and means for preventing it was sought. These means, as a rule, consisted in connecting different points of the rail circuit to the negative bus-bars of the station, by return feeders, and in making metallic contacts between the rail and pipes at points where the current was leaving the pipes; also in metallically connecting the pipes near the station with the negative bus-bars. No electrolytic damages is done when the current leaves the pipe through a metallic conductor; it is only when the current passes from the pipe through an electrolyte, such as is furnished by moist soil, that corrosion takes place. In some places, the joints of the pipes have been insulated to prevent the current from passing through them and this is perhaps the most efficient means of avoiding electrolytic troubles.

Alternating-current Motors.—The most important drawbacks of the induction motor are these: In the first place the motor has practically the same characteristics as a direct-current shunt motor and, therefore, does not afford the variation of speed with load that is one of the most important and valuable features of a series motor. In the second place three circuits are necessary to operate the machine and while the track can be used for one of these circuits, the necessity of two wires over each track, the wires having a considerable difference of potential, makes the practical operation of such a traction system difficult. Numerous systems have been devised for regulating these motors, but they are either complicated or inefficient and it is the opinion of the writer that induction motors will not be used for railroad work except under special conditions. The only advantage such a system offers is that the hand switches that can be and this advantage is neutralized by the fact that the three conductors necessary make high potentials practically unavailable. Electric traction offers a wonderful opportunity for saving in capital expenditure, where expanding demand requires facilities which by other means would be inordinately expensive to provide. The higher sustained speeds of electrically-hauled trains on heavy grades offers an irresistible opportunity to expedite traffic and the flexibility of make-up and movement of municipal and suburban trains is a most valuable consideration. The fact that electricity as a source of railroad motive power offers the only possible connecting link between the waterfall and the locomotive gives it an unique position in the general power distribution field. It is more difficult to prove out the economy of electric operation on this basis, but it is certainly sound over-all conservation to use to the limit a form of motive power that cuts down mate-
1 Caterpillar Tractor for farm work

2 Caterpillar Tractor for army work
Design features introduced to ensure reliability and low maintenance cost include particularly (1) Form-wound armature coils, with special insulation in the ends of the slots; (2) Strap-wound field coils securely fastened and held against vibration; (3) Substantial brush-holder design and construction; (4) Mica insulated, undercut commutations; (5) Bearings of ample size with oil-gauging pockets, lubricated by oil drawn up and filtered through waste; (6) Two-point gear case suspension. The unit switch control has proved itself capable of handling the heavy currents encountered and also to withstand the bumps to which the locomotives are subjected, particularly in switching work, low-speed, drag-freight service or mainline service. In this control the various main circuit connections are made by unit switches, actuated by compressed air taken from the air-brake system; the admission of air to the switch cylinders being controlled by magnet valves, which valves are operated by current from a control circuit through a train line from the master controller. Current from this control circuit is tapped from points on the control resistor which is connected between trolley and ground, or may be supplied by a storage battery.

In late years the solution of the electric railway problems has become more difficult. The automobile has become a most serious competitor; at this time more than 6,000,000 pleasure cars are licensed. The automobile has not only decreased riding upon the trolley cars during business hours, but it has deprived the railway of practically all of its pleasure riding. The entire economic basis of the industry has been undermined and if the business is to survive it must be a radically different business in the future than it is at the present time. It must, in the first place, secure prompt and adequate relief by a sufficient increase in revenues to enable it to function as a public utility; for a rejuvenation of credit is essential to carrying through the radical readjustment in operating methods which will be necessary. In many of the smaller cities, the companies must turn to one-man cars, permitting more frequent service with reduced operating cost. In the larger cities the companies and the public must face the necessity of abandoning the theory of a flat five-cent fare covering the entire city area and of charging the passenger according to the distance which he rides. See American Street Railways; Railways, Street.

Edward S. Farrar, Consulting Military and Civil Engineer.

**TRACTION ENGINE**, an engine designed for drawing loads on ordinary roads or across country, and thus distinguished from the locomotive which hauls loads over steel or iron rails. The traction engine is designed to withstand severe jolts and to climb gradients of at least 1 in 10 and on a surface which sinks somewhat beneath the weight of the engine, thus presenting a continual slope upwards in front of the wheels. The speed seldom exceeds eight miles an hour and consequently it is usual to reduce the speed of the driving-wheels from that of the engine shaft by intermediate gearing. Usually attached to the main axle is a winding drum, by which heavy loads may be drawn up bad hills on a wire rope, the engine having previously ascended, light, to the top. A heavy fly-wheel and a high-speed governor are provided. The driving-wheels of a traction engine have tires or treads of great breadth to distribute the weight of the boiler and engine over a large area of yielding roadway. The tires are also usually corrugated or roughened to give adhesion. A very efficient means of steering is always provided in the traction engine to enable it to make the sharp turns required in ordinary roads, and it is furthermore usually so designed that by throwing out the intermediate gearing from connection with the traction-wheels, the steam-engine proper can be used as an agricultural engine for threshing, milling, pumping and other similar purposes. Light traction engines were once
 favorites in drawing plows but have been displaced by the tractor of the internal-combustion engine, although these are really traction engines. It is, however, usual to limit this term to the older type of land engine propelled by steam. This type appears to hold its place in America for hauling threshing machines to the field and for driving them. In roadless countries, such as parts of Australia, Africa, etc., a heavy type of traction engine is employed to haul trains of wagons, as well as to act as portable engines for driving threshing machines, etc. Engines designed for threshing outfits are supplied with fire-boxes capable of burning wood, straw and refuse fuel. Since the opening years of the present century the steam traction engine has been displaced to a very great extent by tractors and engines of the internal-combustion type. (See TRACTOR.) Consult Muggard, James H., 'The Traction Engine: Its Use and Abuse' (3d ed., Philadelphia 1915).

TRACTOR, a machine that draws a load, especially a power-engine mounted on wheels for traveling on roads or rough ground and hauling wagons, trailers, plows or cultivators or the like; a traction-engine. The locomotive (q.v.) was the first common form of tractor, but does not bear the name, and by common consent the term has been confined mainly to road-engines that do not operate on a track or ride on rails. The word tractor began to be used when steam plowing became general. For this purpose a road-engine was developed with massive wheels, having broad metal tires that would not sink readily in soft soil, and to give them greater grip on the ground, or tractor capacity, cross-pieces were fixed on the rims, so as to resist slipping when there was hard pulling. This engine was provided with a long, horizontal boiler, an upright smoke-stack and many of the conveniences of a locomotive. At the rear was usually a draw-bar, to which could be hitched a gang of plows, or cultivators, or mowing or reaping machines. It was mainly used on the Great Northwest, and has been largely introduced in the principal agricultural countries of the world. International plowing matches have been held with these farm tractors, notably at the Canadian government experimental farm in Ontario. These have been instituted by the Ontario Department of Agriculture in co-operation with Plowmen's Associations. But these farm tractors have been too large and costly that their use was prohibited on small farms, and they have been satisfactory only on approximately level areas of ground.

It has remained for Henry Ford and Son to produce a small and inexpensive tractor adapted to the use of the small farm. This machine is known as the Fordson tractor, and as introduced in 1918 carried a 22 horsepower kerosene engine, of the four-cylinder type. The frame is like a small auto-truck, and not much longer than the wheels. It has ball bearings, dust protector, and flanges to prevent side slipping. The rear wheels—42 inches in diameter and 12 inches wide—are the drivers, and carry most of the weight; the gripping flanges of these are of angle-steel, set at an angle of 45 degrees. The driver's seat is between the driving wheels, and the motor control is operated from a light control truck. A bevel-pinion and sector are connected with the steering wheel, and the engine is enclosed and lubricated by oil splash. Dim under this is the throttle lever, the spark is being adjustible. The distance between the wheels, constituting the tread, is 38 inches, and the machine can turn a complete circle within 21 feet. The ordinary plowing speed is two or three-quarters miles an hour, with a load of two and one-half miles an hour, the draw bar pull being 1,800 pounds and 2,500 pounds respectively. When traveling or doing farm work, a speed of six and three-quarters miles an hour is available. Fairly good ground can be plowed at the rate of about three-quarters of an acre an hour, varying, of course, with conditions. A little less than three gallons of kerosene per acre is a fair average consumption. With fuel and water tanks full, the machine weighs 2,700 pounds.

AUTOMOBILE TRACTORS. As soon as modern auto-trucks were perfected and began to have a considerable sale, it became apparent that it was a convenience to separate the tractor from two or more parts, one being a tractor, the others trailers. Many of the manufacturers of auto-trucks build tractors on the same general lines as their trucks, instead of providing them with a rear body carrying a load, there is simply space for attaching a "fifth-wheel" device, or else a draw-bar, which a trailer can be easily attached to. A typical form of these is shown in the illustration, the tractor having four low heavy wheels with radiator, motor and cab in front, and rear of the chassis' clear for supporting a fifth wheel or turntable device, on which the front end of a trailing car may be supported. About 40 per cent of the weight of the trailer is designed to be carried on the tractor, and as the trailer has but two driving wheels, located at the rear, it is provided with the extensive wheel frame, in the front with a pair of light driving wheels, that are swung out of the way when a part is attached to the tractor, which can be used to keep it upright when not connected with the tractor. This type of trailer is of the four-wheeled type, that bears all its own weight, and is pulled by some form of draw-bar.

The combination of auto-tractor and trailer is very convenient, for it not only enables the tractor to do the plowing or other work, but it can be used to haul all sorts of freight cars, and often a number of them in a train.

The method of connecting the tractor to the trailer by a fifth-wheel device is shown in the illustration. Tracks T are mounted on the frame F of the tractor, and a swivel S is between the rails. The fifth-wheel device consists of an axle centrally mounted on the swivel, and two light wheels W. W that are round, of steel construction, and revolve in a half circle. The forward end of the trailing car C is mounted and fixed on this fifth wheel device. The fifth-wheel device of course takes its name from the fifth wheel on the front axle of an ordinary wagon, though
has been developed into a mechanism that is much more than a wheel. Some manufacturers use a swiveling pair of bolsters instead of this fifth-wheel device. When a trailer is loaded ready to start, the tractor is backed up to it and hitched on. In simply guiding the wheels of the fifth-wheel device upon the tracks: or, if an automatic coupler is used, the method of connecting may be very similar to that used in coupling railway cars. It is necessary to provide trailers with brakes, else they might create trouble in going down hill, and these have to be connected with the tractor, so as to be operable in unison with the brakes when set by the driver. The connection between tractor and trailer must also be such as to permit a rocking motion, so that when passing over uneven roads all the wheels shall travel on the road without straining the framework.

Military Tractors.—The military "tank" which attained fame in the World War was based on a peculiar form of tractor designed to work of the naval- and army-engineering operations, canal building, etc. The very heavy endless chains, bearing feet on each link, fitted these machines for the most arduous pulling work under the most trying conditions, and some military man among the British recognized their possibilities when armored, and the military "tank" was the result, introducing this type of machine to untold thousands who otherwise would never have heard of it. Though too slow of operation to compete with the ordinary tractor of auto-truck type, yet the tank-tractor has such superiority in marshy, stony and very rough ground, that it has obtained considerable use.

The Symmotor.—Another peculiar form of tractor that has been invented by a New Jersey genius is called the symmotor. It is an adaptation of the motor-cycle to agricultural traction. Instead of pneumatic tire wheels, this machine is provided with steel rims and angle grips, like the wheels of big farm tractors, and is designed to draw cultivators, seeders and small mechanism used in truck farming. Its peculiarity lies mainly in its being attached by a wire to a central post, around which it circles in revolving spirals. When started on a circle of ground it does its work automatically until the entire circle of 100 or more feet in diameter is plowed or cultivated, excepting a small portion in the centre. It operates in a four- to seven-foot swath, and uses gasoline fuel.

The drawing or pulling device of a rope-way or wireway is also termed a tractor. See Motor Truck; Tank.

TRACTOR, Caterpillar. A tractor employing, instead of the usual drive wheel, a flexible steel belt, or track, which supports the weight of the machine, even in very soft ground and gives it greatly increased tractive efficiency under all conditions. Invented by Benjamin Holt, of Stockton, Cal., about 1900, it was first used in the peaty soil of the San Joaquin delta, or "smile," country. It is particularly adapted to cultivating or other plowed ground, since there is no soil packing; to reclamation work in swampy land; to haulage where roads have not been established, as in desert, forest or in military operations; to climbing grades, since it affords unusual pulling effort in proportion to weight, and to other extreme conditions. It is also used, of course, wherever ordinary tractors can be used and is often preferred because of absence of injury to pavements. "Caterpillar" is a trade-marked word properly applied only to the Holt tractor. Other tractors following the same general principle are referred to as "Crawlers," "Creepers," "Alligators," "Centipedes," "Tracklayers," etc. See Tank.

TRACTOR ENGINE. See Internal Combustion Engine.

TRACY, trâ'si, Benjamin Franklin, American lawyer and politician: b. Oswego, N. Y., 26 April 1830; d. 1915. He was admitted to the bar in 1851, was district attorney of Tioga county in 1853-54, and in 1860-65 organized a republican party in New York State and served in the legislature during 1861-62. At the opening of the Civil War he recruited two volunteer regiments in New York, the 109th and the 137th, and became colonel of the former. Later he was colonel of the 17th regiments of United States negro troops, and at the close of the war was brevetted brigadier-general of volunteers. As United States district attorney for the eastern district of New York, 1866-73, he drafted an internal revenue bill which more than trebled the United States revenue at a time when the huge war debt was being liquidated. In 1881-82 he served as judge of the Court of Appeals, and in 1889 became Secretary of the Navy in President Harrison's Cabinet. His term was marked by a large increase in the navy and the formation of a reserve naval militia. At the close of this service he resumed his law practice in New York. He was president of the commission that drafted the charter for Greater New York in 1895-96, under which he was the Republican candidate for mayor in 1897, but failed of election. In 1899 he was counsel for Venezuela in the boundary arbitration between that country and England.

TRACY, Joseph, American Congregational clergyman: b. Hartford, Vt., 3 Nov. 1794; d. Beverly, Mass., 24 March 1874. He was graduated at Dartmouth in 1814, ordained to the ministry, and was pastor-of churches at West Thetford and West Fairlee in 1821-29. He edited the Chronicle, Windsor, Vt., for five years, the Boston Recorder for one year and then became president of the Massachusetts Colonization Society and of the American Colonization Society for Massachusetts, which positions he held until his death. He was associate editor of the American Historical Review for many years and published 'Three Last Things' (1839); 'The Great Awakening, A History of the Revival of Religion in the Time of Edwards and Whitefield' (1842); and 'A Memorial of the Semi-centennial Anniversary of the American Colonization Society' (1867).

TRADE. See Commerce; Imports and Exports.

TRADE, Board of. (1) In the United States a body of men selected from among the business men, was appointed to represent and act for the whole business community in advancing and protecting their interests. (2) A similar body acting for a trade or industry, usually for the regulation of trade abuses. (3) In England a permanent committee of the Privy Council, presided over by a member of the Cabinet, and divided into seven departments, each having its separate staff. It controls the issuing of patents, registering of joint-stock companies, handles trade insurance, settles disputes, etc. The British Board of Trade conducted highly useful work during the great World War, exchanging commercial intelligence, and assisting manufacturers and merchants in the unusual problems confronting them.

TRADE ASSOCIATIONS, business organizations composed of the individuals, firms and corporations engaged in a trade or industry, formed and operated to deal with those things in which the membership have a community of interest, as wage scales, uniform rules and measures, guarding of legislative interests, maintaining prices, exchanging of information as to credits of customers, etc. These associations in the United States developed mainly after 1870, largely as a result of the growth and activity of the trade unions. (See UNIONISM). The demands by workmen for better pay and conditions were generally resisted, and employers met and began to organize against their employees. Before such meetings the proprietors in a particular trade rarely had any personal acquaintance, knowing each other's business, and usually having a low opinion of each other, because of sharp competition and business rivalry. Brought into contact over labor difficulties, their views as to each other changed; they learned to respect their competitors, and warm friendships sometimes developed between them. They began to talk with each other about trade problems, and soon saw the wisdom of combined action in securing trade reforms. Their anti-union associations took on a broader scope; they engaged cooperatives and good business managers, and began to do business in those things which were for the common interest and benefit of the trade. So came into being the American Newspaper Publishers' Association, the National Association of Stove Manufacturers, the Association of Wool Manufacturers, the Typotheta (q.v.), The National Erectors' Association, the Coal Operators' Association, the Photo-Engravers' Association, National Metal Trades Association, National Founders' Association and hundreds of others. As time went on, each of these associations tended to enlarge its scope and sometimes several organizations were formed in one trade, to care for different branches of the work. For instance, in New York City, the Typotheta, the oldest organization among employing printers, concerns itself largely with exchanging information as to costs, bookkeeping, preserving fair competition, watching the presses, etc. The Printers' League handles all labor difficulties and settles disputes as to shop rules and the like. The Master Printers' Association concerns itself with the well-being of the smaller printing offices, the job printers, insists on uniform treatment by paper jobbers, the charging of a fair profit on engraving, binding, etc., reports on customs, pay, etc. In most cities, however, one local organization serves a trade wholly, and no need is felt for two or three to look after various branches of work. It is practically true that in every large city there is a trade organization in every trade represented by a considerable number of houses. These conditions have naturally led to combinations to keep up prices, and the public has been jealous at times of certain organizations, which they classed as a trust in certain trades and industries. At times the suspicion of taking unfair advantage of the public was well founded, and at other times the members of a trade association have only sought fair protection from competition that was ruinous and not advantageous to the community. Where the trade organizations have gone too far, and used their power of co-operation to push prices above a fair level, there has usually been a reaction; either district attorneys have brought criminal prosecutions for combination in restraint of trade, and caused the dissolving of trade associations, or else the increased prices have brought new firms into the field, that did not belong to the association, and these have undersold, and brought down the level of prices to a basis of keen competition. Of late years there is a tendency in the United States for the large trade organizations to work together for business reforms. They call upon each other for assistance in securing needed legislation, and they have formed a National Association of Manufacturers, whose influence is very powerful. See TRADE, BOARD OF; CHAMBERS OF COMMERCE.

TRADE DOLLAR, a former coin of the United States, containing 378 troy grains of silver and 42 troy grains of alloy. Trade dollars, issued under Act of Congress 12 Feb. 1873, were legal tender to the amount of $5. Those issued under the Act 22 July 1876 possessed no legal tender power. They were intended for trade with countries doing business on a silver basis. As silver depreciated in value the trade dollar depreciated, and speculators bought them abroad at 80 or 90 cents and circulated them in the United States at face value. This was easy because specie payment had just been resumed by the government in 1875, and people liked the silver. When the lower value was generally understood, and they continued to fall in price, they were objected to and gradually disappeared from circulation.

TRADE-MARKS. Certain marks or inscriptions set on manufactured goods for the purpose of establishing the identity of their manufacture or selection. An examination of the evolution and development of the trademark in the United States of America is substantially an examination of the evolution and development of the vast commerce of our country.

Definition.—A trade-mark is a mark or sign indicating the source or origin of the article to which it is affixed. Unlike a patent (q.v.) it is agreement evidence it evidences competition, and lays claim to a degree of superiority in such competition. A trade-mark may consist of a word or words, or of a symbol, design, device or picture; or
it may be constituted by an original and distinctive shape or form of package in which the goods are packed or contained; or it may consist of a combination of some or all of these elements; but in whatever form the trade-mark appears on the market, its office is either to indicate the origin or ensure the manufacture of the article, or when used, as it may be, by the dealer who sells to the ultimate purchaser or consumer, but who does not manufacture or produce the article, it may then indicate selection or endorsement of the manufacture of the article bearing such dealer's mark.

Office of the Trade-mark.—Not only does the trade-mark indicate the source or origin of the goods to which it is attached, but it also performs the office of guaranteeing or assuring to the purchaser, whether he be an intermediate or an ultimate one, that the honest skill of the owner of the trade-mark, the good quality of the goods, the carefulness of selection, the purity of ingredients or correct and fanciful design or measure are to be found in the articles to which such mark is affixed. Further than this the protected and defended trade-mark builds up for the manufacturer to whom it belongs that following in the market which becomes intensely valuable in appraising the goodwill of such a business.

The Origin of the Trade-mark.—The introduction of the trade-mark into commercial use was natural, and when once effected rapidly became a trade necessity. A chemist in the olden days prepared a mixture or lotion and recommended it to the customers of his shop, who found it efficacious. A shoemaker made shoes for his patrons which by reason of good quality and superior workmanship won favor for him among his patrons; so that these trades-people, pursuing their various lines of industry, not only retained their custom, but were recommended by their patrons to others, such customers becoming accustomed to resort to the shop of the one or the other of these trade-marks who supplanted such wants, a habit which is known in law as the goodwill of a business.

So long as the customer of the chemist transacted his business face to face with him in the same old shop or store, neither the shoemaker measured his patrons and delivered his goods to them in person, so long was it unnecessary for such manufacturers to mark their wares.

Their customers and patrons obtained a personal delivery and needed no other assurance or guaranty as to the genuineness of the articles purchased by them; but after a while, some of these purchasers and users of these various articles removed to other localities, and would desire to continue to use the same lotion or wear the same shoes; and they would order the same directly, if they could; or through some agent middleman if they could not; and then in the latter case, to quiet any apprehension which such customers residing at a distance might feel regarding the genuineness of the articles delivered to them, the chemist would affix a label to the bottle or jar containing the lotion, which would bear his name and address; and the shoemaker would mark on some part of the shoe his name and address; after a while the producers of these various articles found that the mere use of their name and address, while constituting a good and sufficient indication of the origin of their products, was nevertheless subject to several matters of inconvenience; the first was that perchance many of the customers could not read; and the next was, that the use of the name of the manufacturer alone was attended by a legal difficulty, to wit, that while a man's name would constitute a most perfect trade-mark, yet any other man bearing the same name had an equal right to use it, provided he did so honestly and fairly, and if engaged in the same line of business, a trade confusion would naturally and often did arise, as witness the Brown Iron Bittes case.

Adoption of Symbols and Arbitrary Words.—To reach and remedy these difficulties, manufacturers then began to adopt and use symbols consisting of pictures or devices, at first simple in their nature, such as shields, stars, geometrical figures or representations of animals and the like; they also coined arbitrary words and fanciful marks or devices of origin, which were generally used in connection with the name and address of the manufacturer; and so it came to pass that symbols, devices and arbitrary designations or titles were slowly, gradually, but generally substituted in the place of the mere name and address of the manufacturer; the goods in due course of time became known by such marking; the marks, in turn, served to indicate origin, as well as to guarantee the peculiar excellence which the purchasers or consumers expected and had a right to find in their purchases with respect to quality, purity, measure or value.

So public usage has also often given an accidental meaning to a trade-mark, not at all contemplated originally; as witness the case in France, where a man named Jean Bardon manufactured cigarette paper, marking it with his initials, "J. B.," which he separated by a lozenge, so that the mark appeared to be the word "JOB." The public became accustomed to call for "JOB" paper, and that name was duly protected as a trade-mark, although it had never been intended to invent or use the word "JOB" in connection with Jean Bardon cigarette paper.

Requirements of a Valid Trade-mark.—Inasmuch as the chemist, the shoemaker, the grocer in "markets over" or "open markets," it so soon became evident that, in order to secure a trade-mark which would be unique, and the exclusive property of the person or firm originating and adopting it, such mark would of necessity have to be one which others did not have an equal right in law to use for the same class of merchandise; so that it became an established rule of construction of the law of trade-marks that no mark would be protected as the exclusive property of any one person which others had an equal right to use; as, for instance, a mark indicating quality, or a geographical mark, indicating that the goods bearing the mark were made or produced in a certain locality; or a mark which merely consisted of the statement of ingredients, or the generic or class title of the article; to be perfectly plain, every person living in New York, making hats or shoes, or other articles of commerce, would have the right to label and the right to use the word "New York Hats" or "New York Shoes" or the like; so every person would have the right to make
the "Best Quality Hats" or the "Best Quality Shoes" or "Superior Hats" or "Superior Shoes" or the like.

Kinds of Trade-marks.—There are two distinct kinds of trade-marks, to wit, a mark consisting of a word or words, or a mark consisting of a symbol or picture.

The former kind may be designated as an "ear-mark," and being mainly distinguished, when legally fixed, it has been held by high authority that the use by another of a similar word, alone or in any form or combination, or in connection with any style of label or form of package, is unlawful, and would constitute an infringement upon the original mark.

The other kind of a mark, consisting of a symbol or picture, may be designated as an "eye-mark," because it appeals to the sense of sight. To constitute an infringement upon such a mark, the defendant's mark must be of so close a resemblance as to be likely to mislead a purchaser using ordinary attention. There may be also an infringement upon important parts of a trade-mark, without the whole of the mark having been infringed. This will be the case, because the law does not look for complete identity in the imitation trade-marks, but similarity will be held sufficient to warrant the interposition of a court of equity.

Secondary Meaning? Phrases Protected.—In dismissing this branch of the subject, it may be stated that no mark which merely indicates an essential element or quality of the article to which it is applied can be exclusively appropriated as a trade-mark, subject, however, to one important qualification which has attended the evolution of the law of protecting industrial property in this country, and which was rendered necessary by the natural and proper desire on the part of our courts and judges to do equity and to protect the purchasing public.

The exception to which we refer is when a term, phrase, title or designation which is used in connection with a trade-mark acquires what is known as a "secondary meaning" in the market. By this we mean that when a phrase, title or designation, which of itself could not be protected as a technical trade-mark, because primarily conceived and designed to merely invite trade or catch and engage public attention, becomes in time so identified and associated with the articles of merchandise to which it is affixed, that the public, on seeing it, at once recognizes that it stands for the goods to which the trade-mark proper is usually attached, even though that mark should be absent.

An illustration of this may be found in the case of a trade-mark for a certain medicine; the words "Candy Cathartic" are certainly descriptive, as fully descriptive as any words well can be; but they had been used to so large an extent and were so thoroughly advertised in connection with the medicine, in question that it was shown that many purchasers instead of calling for the trade-marked name of the article would ask for "Candy Cathartic," any druggist handling the article so associated and identified the secondary phrase or title, "Candy Cathartic," with the trade-mark proper that when "Candy Cathartic" was called for a box of the tablets would be promptly handed out. The court accordingly protected such descriptive phrase by use by a competing firm.

"Camel's Hair," a purely descriptive term for belt ing, was protected after it had acquired a secondary meaning on the market, as applying to a particular make of belt ing. Likewise, "Stone" was upheld as a designation for ale, the name Stone being the name of the village in which the brewery was located, and which through such use had come to designate a particular product.

Likewise, a geographical name may acquire a secondary meaning, especially against infringers who do not reside in the same geographical territory or locality; as witness the fact that "Saint Louis" was protected as a mark for lager beer against brewers using the same title, but not doing business in the city of Saint Louis. The history of the "Durham" tobacco case may also be profitably considered, where Blackwell, the proprietor of "Durham" smoking tobacco, failed in his attempt to restrain another tobacco manufacturer of Durham from using such title in connection with tobacco, whereas certain Virginia tobacco manufacturers outside of Durham, becoming emboldened by the defeat of the Blackwell concern, began to use the title "Durham" in connection with their tobacco, but were promptly enjoined from so doing by the court.

By it no means follows, however, that the defense of such trade-marks by the courts establishes the wisdom of their selection as such marks. On the contrary, they are to be avoided as leading to litigation more or less annoying and expensive. In the selection of a trade-mark every precaution should be taken against personal, geographic and descriptive names, and equally against such marks as in appearance or in sound as spoken shall simulate trade-marks already owned by others. An error in these respects, even though it escapes legal prosecution, may result in the partial or total waste of money spent in advertising, which, indeed, may redound as well to the advantage of a competitor as to one's own. Another point to be remembered in devising or selecting a trade-mark is that it should be simple and easily recognized. Few customers give keen and close observation to goods purchased, and the ultimate value of the goodwill of a manufacturing business may be largely dependent upon the instant and unqualified recognition of favorite brands.

The Doctrine of "Clean Hands."—Another and most important must be considered by the owner of trade-marks is in their correct use of their trade-mark.

The usual protection and relief sought against infringement and the invasion of trade-mark property is by means of a suit in equity brought to restrain the infringer from continuing to imitate or use the infringing mark, and for an accounting for damages; but as such a proceeding in equity is governed by well-settled principles of equity, one defense which has been frequently urged and successfully raised to defeat any action on the part of the owner of a trade-mark is what is known as the defense of "unclean hands."

It is a well-settled principle of equity that
TRADE-MARKS

he enters a court of equity, seeking equity, do equity, and come with clean hands.®
other words, a party will not be heard
mplain of the wrongful acts of another
against himself, if that same party has
guilty of similar wrongful acts of fraud,
presentation or deceit against the pur-
ging public.
the United States Supreme Court in the
ated and leading case of Manhattan
Company against Wood, many
ago, laid down the doctrine that a party
find no relief in a court of equity as
it an alleged wrongdoer if he himself
guilty of wrongdoing in using the mark
eive the purchasing public.
ving this important fact in mind, it be-
s trademarke owners and users to be very
il in the use of their marks, labels and
ages, and the following simple rules may
be observed for their protection and benefit.
statement of the mark, its origin or
quantity of the articles to which the
is attached should be used in connection
he labels, packages or accessories of the
. So, also, if a trade-mark was not orig-
adopted by a party but was acquired by
er or assignment, such fact must be dis-
ounced on the labels or packages. The
, however, will not countenance the trans-
assignment of a trade-mark except as
of the transfer of the business which it
presented. The business cannot be trans-
to one party and the trade-mark to an-
tile the doctrine of "Unclean Hands" has
 carried to a very great extent by the
, it has been held in many cases that the
an application of such a rule would lead
destruction of valuable industrial prop-
nd, at the same time, relegate the purchas-
blic to the tender mercies of false, fraud-
and infringing marks.
trale courts have in many cases recog-
ct that where there is no vicious or
ful intent on the part of a trade-mark
, who is shown to conduct a legitimate
est business, that slight lapses or im-
al conduct do not put such an assignee
and statements which are substantially
although not entirely so, will be over-
and not visited with the punishment of
g equitable relief to the trade-mark
which is guilty of such infractions.
understanding which the public has of
trade customs or usages are also al-
to prevail; as witness the "Hennessy
® cases, decided by the New York courts
ells, where the defense was interposed
e misstatement of fact, of the absence of
r quarts in size, and that, therefore, the
of said trade-mark were guilty of in-
and misconduct; but the court held that
ach as such pints or quarts were known as
erl® pints or quarts, and understood
by the purchasing public, that no fraud
her contemplated or had been committed,
ough the bottles to which the mark was
d were not of full measure.
 TRADE-MARK Property is Acquired.
by a party by priority of acqui-
and continued use on the market.
e announcement of an intention to adopt
a certain title or symbol which is not followed
or accompanied by use on the market does not
confer any trade-mark rights. Moreover, the
law requires that the trade-mark shall be in
actual use in trade before application is ma-
ple for its registry. There is no mark may be
lost to by deliberate abandonment or the transfer
to others of the title or goodwill of a business
in which the mark has been used.
The person who adopts and first uses a
certain distinguishing mark for his goods, be-
comes possessed with what is known as the
common-law right of ownership thereof, and
such right is an enforceable one, and will be
protected by the courts of this country.
Patent Office Registration.—Trade-marks
may be registered under the existing registra-
tion statutes only when the same are used in
commerce with foreign nations, or among the
several States or with Indian tribes. The
provision for marks used among the several
States is new and in force since 1 April 1905.
Under this law marks exclusively used for 10
years preceding the passage of the law can be
registered, irrespective of the prohibitions in
the law, which would otherwise apply. Regis-
tration confers no greater property rights than
are acquired under the common-law right of
ownership, except that triple damages may be
recovered in certain cases. Registration, how-
ever, does not create a right to a trade-mark;
this is gained only by priority of adoption. The
trade-mark thus signifies a public claim to such
adoption and use; if it is not in accordance
with the facts the registration may be canceled.
Before registry a trade-mark is published 30
days in the Official Gazette of the Patent Office,
during which period any person having good
grounds for believing that its registration
threatens his rights may oppose its registration.
Besides the national law in the matter most
of the States have trade-mark laws which pro-
tect the infrastate use of a trade-mark, a use
which is not covered by the Federal law.
Assignment of Trade-marks.—Trade-
marks may be assigned with the goodwill of
the business in which they are used, or a trans-
fer of the business itself; or they may descend
by inheritance; but such an assignment
recorded in the United States Patent Office
within three months of its date or the good-
will thereof does not vest in the assignee any
enforceable right or title. A trade-mark has
no value or standing apart from the goodwill
of the business of which it has been a part.
Partnership Marks.—Upon the dissolution
of a partnership, either partner may there-
after continue to use the trade-marks of the
partnership, unless the same are otherwise dis-
pensed of upon the dissolution, or where other
contractual relations exist governing the future
disposition of the same upon a dissolution.
Defenses.—In cases of infringement, actual
defense by the infringer need not be proven.
The likelihood of deception is sufficient to war-
rant the interposition of a court of equity.
It is no defense that the infringing article is
superior in quality to the genuine, nor is the
absence of intent to deceive a defense. Laches
or delay in asserting rights are generally held
to deprive the owner of the right to claim dam-
ages or obtain a preliminary injunction. Aban-
donment is also a good defense, but strict proo
of an intention to abandon ownership is essential to the establishment of this latter defense.

Patented Articles.—Where a new trade-mark consisting of a word-symbol is affixed to a patented article, the right to use such name or title for such article will become public property upon the expiration of the letters patent, as was held in the "Castoria" and "Singer Sewing Machine" cases. Otherwise the monopoly enjoyed by the owner of a trade-mark is perpetual.

State Laws.—In many of the States, acts have been passed making it a criminal offense to refil or use again without the owner's consent bottles or other packages which have been registered under what are known as "Bottling Acts" or Trade-mark Registry Acts; so in many of the States the imitating or counterfeiting of trade-marks is made a criminal offense.

Labor Union Marks.—In many of the States labor unions or associations of working men are permitted to register their labels or device marks to which such labels or marks are affixed, as a trade-mark; and such marks have been sustained as constitutional in most of the States.

Copyrighting of Labels.—New labels, not previously used, and containing some artistic or novel character of design, may be copyrighted in the United States Patent Office and will be protected for 30 years. But labels which merely describe an article, or only indicate size, number or weight, or are only the result of the application of the typesetter's art, are refused copyright entry.

Unfair Trade Competition.—An article on the subject of trade-marks and their protection in this country would at the present time be incomplete without some mention of the cognate subject of "Unfair Trade Competition."

The evolution of the law of trade-marks in course of time satisfied the courts of this country that the mere enforcement of strictly technical trade-mark rights fell far short of the practical requirements and necessities of our commerce, inasmuch as the purchasing public was being constantly cheated and defrauded in having goods not of a genuine source of origin presented to them under the name of such genuine goods, as well as the purchasing public, were frequently left without redress or legal protection. To remedy this defect of the administration of justice, the restraining of unfair trade competition was applied to cases where technical trade-mark rights could not be enforced.

The essential difference between a case brought to restrain the infringement of a technical trade-mark, and to restrain a case of unfair trade competition, may be summarized as follows:

Both suits are brought to restrain a fraudulent act of the defendant; both proceed on the theory that a court of equity will protect the property rights of the owner of the trade-mark, and, at the same time, guard the purchasing public against being deceived; but while in a case brought to restrain the infringement of a trade-mark, no proof of actual deception is now required, nor is any proof of damage to the owner; in the suit brought to restrain unfair trade competition the essence of maintaining suit is in the establishing of the fraud committed by the defendant and the actual deception caused thereby upon the purchaser. Probable deception is ranked with actual deception in constituting infringement. It is strung as an acronym to steal the great established business.

It thus follows that in the external principles of doing equity and giving fullest protection to the purchaser, man may even be restrained from using his own name in the transaction of his business where such use is of a fraudulent character calculated to breed trade confusion and to mislead and deceive the purchaser already accustomed to that name as with another line of merchandise.

History.—Trade-marks are of antiquity, being found on bricks unea among Egyptian and Assyrians and upon Egyptian pottery dating back to 6000 B.C. Such goods were on gold and silver ornaments and engraved jewels, and the containers used by Roman pharmacists for their salves, sanitations. In more recent times the laws protecting workers in metal and armors in such trade-marks as 1374. In the Middle Ages guilds in Germany, France and Italy compelled use of trade-marks by their members as a protection to the purchaser as well as to the trade, general. Trade-mark protection in England did not begin until 1783, and it was not until 1787 that laws were passed which afforded adequate protection. In the United States for a trade-mark law began in 1790 and the Federal trade-mark law was not among the statutes until 1870. The present bears date of 1905.

Trade-mark law in the United States has substantially been made during the last two decades; for the first reported American mark case found in the books is in against Locke, decided by Chancellor Coxe in the Court of Chancery in the State of New York in January 1840. The following years have seen sporadic and individual American trade-mark cases until the owners of such trade-marks, as well as the purchasing public, have frequently been left without redress or legal protection. To remedy this defect of the administration of justice, the restraining of unfair trade competition was applied to cases where technical trade-mark rights could not be enforced.

The essential difference between a case brought to restrain the infringement of a technical trade-mark, and to restrain a case of unfair trade competition, may be summarized as follows:

The Philosophy of the Law of Trade-marks.—The whole legal and underlying principle of the law embraced in this subject is the idea that the entire philosophy of our law is founded upon the theory of securing honest trade and fair competition in the commerce of our national market. The doing of strict justice between man, while protecting the property rights which are at the present time found to exist in the transaction of business, both in the ability to enjoy and secure from invasion the marks or descriptions of the goods, is the effort to retain the good will, which are used, even if one has or can have the right to sell as ostensibly the product of another, and to build up a good will by pronounced of his products.

Equity has been poetically termed "flower of justice"; and equity, with its rules, and with the acute conscience
t, is able to prevent and remedy acts of
vice, where the law itself would other-
prove powerless and futile. See Patents.

RADE AND TECHNICAL PRESS,
rican. The principal function of the trade
tical press publication is the advancement of
ommercial, industrial, professional, scien-
or other interest, which they represent, by
ing the reader informed as to the prevail-
itions of his trade throughout the trade
and even the entire world. Thus a
edited, broad-minded, accurate and pro-ive trade journal will exert a great influ-
ward welding together the separate
 of each great profession, trade or in-
y into one vast community of interest.
ral newspaper and the trade journal
 the fact that the former appeals to
whole public, whereas the latter caters to a
er class of professional, commercial, tech-
or scientific readers, giving within its
as only such knowledge as pertains to its
al field.
ese organs, of which every great trade
country has its own, bring to the atten-
of those interested any invention or dis-
y which is, or in time may become, of
t importance, but which to the general
c would be of little or no interest; they
ent the conditions of the home and foreign
ets by giving tables of quotations others
accessible to the trade; and gather re-
able information which may be a guide to,
how any light upon, future conditions.
ved processes or methods of manufac-
and changes or improvements in other
ries which would possibly have a bear-
 upon a certain trade; the many items of
ral interest to the lines with which they
erned, and the public questions which
ly affect those interests; the almost in-
 changes taking place in the industrial
d; all these, and more, are chronicled in
issue of the trade journal and discussed
knowledge of detail, a grasp of the sub-
 and fullness of treatment to be found no-
e else.
uch papers are of much importance to the
 they represent. Some are merely ad-
ing sheets; some contain literary matter
 with the special news; others are deeply
ic; yet each is conducted to subserv
interest of the respective trade. Of these
 are some are published weekly; some semi-
ly and others monthly; and a number of
ancial papers, which may be considered as

belonging to this class, are published daily.
Some instances among trade journals have en-
joyed remarkable and continued success, and
have financially prospered far more than had
been hoped, but the history of journalism is
strewed with the wrecks of others whose exist-
ence was of such short duration that they did
not pay for the original investment.
That the trade and technical journal may
have the highest standard of editorial service
and supervision, it is necessary that experts
should be employed in the writing of articles,
and none but the ablest men in each separate
line should contribute, for the reader is gen-
erally an expert in the topic of which they
are employed. The trade and technical journal
is the repository of the information and news
of the field, and it is the duty of the editor to
procure and edit them, and to present them
with a vividness and freshness that is not
 tolerated in the ordinary journal.

The trade journal also occupies an important
position in the field of advertising, for the
judicious advertiser selects the publication which
is read by the class to which his merchandise
will appeal, and this method is more economical
and profitable to him than employing the ordi-
nary newspapers which reach the general public
and are not carefully consulted for technical
matter. The vast number of advertisements
which they publish in every issue, and the prices
which they receive per line for such advertise-
ments are astounding when the competition that
exists for all these is considered. That it is
profitable, however, to the advertiser, is plainly
apparent from the enormous amount of adver-
sising which each journal carries.

The American Railway Journal, of New
York, first published in 1830, was the first
paper which met the desires of one class of
merchants. This was the pioneer of
the specialty commercial journals, and it was
for some time the only one of its kind, for
though a few others had attempted to enter
the field, their stay had been of short dura-
tion, and it was not until 1846 that one which
still exists, was founded. This was the Dry
Goods Economist, but though it began in the
largest trade, it experienced much difficulty in
attracting attention among either the buyers
or sellers, and as conditions at that time were
unfavorable to a journal of this character, it
was not for a long time and only after a bitter
struggle that it rested on firm ground.

These journals were soon afterward fol-
lowed by those in the hardware and leather
trades, known as the Shoe and Leather Re-
porter and The Iron Age, both of which ex-
perienced the same difficulties in gaining a foot-
hold in the commercial world.

Meanwhile, the scientific field had been more
successful as to the number of papers and
periodicals published. The American Journal of
Science was founded in New Haven, Conn.
TRADE SCHOOLS

in 1818, by Professor Silliman, and the Journal of the Franklin Institute, in Philadelphia, in 1825. About 1820 a law periodical was founded in New York, but legal journals did not become common until nearly 50 years later. Medical journals are not always up to date, but some are regularly published in Boston and Philadelphia, and are now to be found everywhere; a little later a journal was established treating of the drug trade. The Scientific American was founded in 1845 and since then many scientific or semi-scientific journals have been started, some of which have touched upon scientific subjects, have been started. By 1860 there were about 20 trade papers and 50 other technical papers; by 1872 this number had increased to 124 trade and 132 other technical papers, reporting 41 different lines, in which religious, agricultural, educational and sporting journals were not included. See Advertising; American Publishing; American Newspapers; American Printing Trade; Newspapers; Periodicals; Journalism; Printing; Printing Presses; Books; etc.

TRADE SCHOOLS. The differences in meaning between such words as vocational, industrial, manual training, technical, trade, part-time, co-operative, continuation, apprenticeship and similar forms of occupational training such as industrial, agricultural, commercial and household arts. A vocational school has for its controlling purpose the fitting of students for useful occupations. The pupil must have reached the age when work can be secured and the courses are below college grade. The aim of such a school is to supplement general education and not to take the place of it.

Industrial education is used in a broader way as in a restricted sense. The term covers all education connected with the industries such as the industrial and household arts of the elementary and secondary schools, technical and trade instruction for industrial workers and training in engineering schools. The term Industrial school is used at times in America to indicate instruction of a primary order which gives pupils one or more branches of industry in order that habits of work and thrift shall be inculcated. This form of school is often used for reclaiming young offenders from evil habits, or for dependent and neglected children.

A manual training school offers activities of a more or less trade-like character with the idea of developing or educating the individual, that hand and mind may be trained together and each help the other. The aim is not to give a wage-earning vocation. The general education in these schools has usually little relation to the trades and is carried further than that imparted in the elementary schools. Such schools are often a feature of the larger city schools. In some of the schools vocational elements are being introduced.

A technical school may be elementary in character or it may train engineers. The aim in both cases is to give theoretical and scientific knowledge connected with a chosen occupation. It prepares the overseer or superintendent rather than the apprentice or worker. In a simplest form such use of tools or apparatus is taught as will show the connection of theory with practice. Handwork is given to explain the science rather than to fit a student directly for a trade. The highest development of this type of school is found in the great technical institutions where both the application of art to industry and the most thorough scientific training are pursued. Two institutions of this kind are the institute of Technology and the great German and American textile schools are examples. The night technical classes so numerous in Europe and America are adding trade features in order to be especially useful to workers who are beyond 16 years of age, the aim being to provide instruction directly related to the employment. Many of the courses offered in the Young Men's Christian Associations are examples. In England the polytechnic schools offer training of this kind. The cylinder, in America is rapidly meeting this same need. Industrial and household arts, science, drawing and forms of industrial arithmetic and English are offered to enable ambitious older workers to get ahead in their trade.
TRADE SCHOOLS

courses, general education, science, drawing and design, business arithmetic and English are frequently given. These schools are being organized in many States as laws are enacted making it compulsory for employers to allow workers between 14 and 16 years of age to attend such schools during the day, for five or more hours per week, without loss of wage. Germany has done much to develop the continuation school during the day and at night. Apprenticeship and craft schools have been organized by some of the railroads and great business enterprises for training their own employees. The work is part-time character and the workers are paid their full salaries. The aim is to increase the ability of the worker for his own sake as well as for the corporation.

This article deals with the trade school as it trains apprentices or journeymen, by day, or supplements their work in the regular trade by part-time classes by day or night. It deals with the wage-earner rather than with the overseer, superintendent and director. The textile and engineering schools and institutes of technology belong to the technical rather than the trade-school field and the instruction is usually of college grade. Some of them have special sections for apprentices, however. Many of the agricultural and mechanical colleges in the United States have trade departments but their work does not always lead to a degree. Drexel and Pratt institutes deal with trade courses in addition to their regular technical and normal aims. Regular all-day trade schools and part-time classes are not yet numerous all over the United States, therefore, other institutions are undertaking trade work to meet the demand of communities to help the workers.

Education for trade has for centuries received attention on the continent of Europe. Complete systems of industrial education have been developed in many countries, from the manual training of elementary and secondary education, through the trade and technical schools to higher engineering and scientific institutions. These schools are generally under government support and control. Within the last 50 years they have become increasingly important and are graduating competent workers for both men's and women's employments. The thoroughness of the courses in these continental schools has rightly given them a high reputation. The length of the trade courses abroad is from three to five years, a fact due to some extent to the demand of the trade unions for a long period of apprenticeship. The United States has some trade schools offering a like preparation. Conditions of artisan life with us are so different that the foreign type of trade school does not altogether meet our needs. The aim here has been rather to give the trade work in as short a time as possible, often in only a few months. This course is frequently accomplished by considerable drill in the theory as well as in the practice of the trade. The New York Trade School offers in its day class three to four months preparation in various building trades, a certificate of proficiency being issued on the completion of the work. European schools do not usually give such short courses as these. The Wilmerding School of Industrial Arts, for Building and Architectural Drafting, the Lick School of Mechanical Arts and the Lux School for Girls, all in San Francisco, and the Williamson School of Mechanical Trades in Philadelphia, correspond more nearly to the European model of thorough training for three or four years. In these schools the aim is to teach the trades with the science underlying them, together with thorough academic courses corresponding to our manual training high schools. The Manual Training High School of the United States surpasses anything of the kind abroad and is a distinctly American type. It does not aim, however, to give trade instruction, and hence the Williamson and the three California schools are not strictly manual training schools.

The value of trade schools has been recognized by foreign governments and they not only control, but also support or subsidize them. The war has temporarily interfered with this instruction in the warring countries, but as peace is established the work will continue. The trade schools already organized all over the United States, therefore, other institutions are undertaking trade work to meet the demand of communities to help the workers.

Germany has been foremost in developing trade instruction to supplement shop experience. The poverty of the workers there, as well as here, forces them early into the shops to earn a living. In order to help these workers to obtain better positions and better salaries, special day, evening or Sunday instruction has been arranged in the Continuation Schools (Fortbildungsschulen). Each German state has made a study of the best way to help its different trade workers. These schools have been so satisfactory that they have not only developed all over the empire, but also in other countries. In Germany they are preferred to the all-day trade school. Belgium and France are renowned for their day trade schools; Austria and Hungary have unusually complete systems of trade instruction, and Switzerland also provide carefully for this class of education. For 35 years Russia has had trade schools to train the workmen in various fields. England's well-organized technical instruction includes trade work also.

GERMANY.

The awakening of Germany to the importance of training her wage-earners took place about the time of the Centennial Exhibition in Philadelphia in 1876, which showed Germany's products to be distinctly inferior to those of other continental countries. The French Exposition of 1878 still further manifested the lack of art in Germany's manufactured goods, and a commission was appointed to investigate reasons and to suggest action. The result of the work of this commission is now seen in the systems of trade and technical schools which have been organized, and in the reputation which Germany now has for the application of science to industry. These schools have been great factors in this change. The German section in the Saint Louis Exposition of 1904 gave evidence that not only in the connection of science with, but also in the application of art to industry, that country has pushed to the front and now takes rank with or even
TRADE SCHOOLS

exceeds those nations which have in the past con-
trolled the industrial field. Germany has be-
come thoroughly imbued with the idea that
money devoted to trade instruction is wisely
spent. The study which has given birth to the
subject has shown her the problem in its
complexity and difficulty. The solution has
been varied to suit the needs of different locali-
ties and also of all classes of workers from the
winter-months of small industries to the direct
work of the great industries. A satisfactory interrelation
between workers, employers and schools has
been the aim as well as social efficiency.

These schools have been founded and are
supported in various ways: by the state, by the
municipality, by the commune, by the trade
guilds, by associations of workers and by
private individuals. There is a marked tend-
cy, however, for the governments of the
German states to assume the entire control and
administration. Small tuition fees are fre-
cently charged. In some of the great technical
or technological institutes gratuitous instruction
is offered to apprentices, but a fee is required for
those who wish to study for more advanced
professional training. Even so, however, cover but
a small part of the expenses.

Germany is giving attention to the training of
apprentices for trade in many classes of
institutions. Different sections of the republic
vary in their way of meeting the problems.
The following kinds of institutions are repre-
sentative: Trade Continuation (Fortbildungs-
schulen) and Industrial Continuation Schools
(Gewerbliche Fortbildungschulen); Trade
Schools (Fachschulen); Technical Drawing
Courses; large technical schools, with sections
for apprentices; apprentice workshops (Lehr-
werkstatten).

Of these the Continuation Schools, generally
conducted by trade guilds, are by far the most
popular for training the ordinary wage-earner.
General education is compulsory in Germany up
to the 14th year. After this time a majority
of the children of the laboring class must
begin to work to contribute to the support of
their families. The continuation schools are
formed to aid those of both sexes who are
forced to work, their object being to supplement
the trade in which the worker is daily employed.
In industrial centres the curriculum is con-
nected with the trades of the locality. In other
sections, the character of the instruction may be
general, commercial or even agricultural, as the
need is felt. The courses deal more with the
theoretical part of the work than with the ac-
tual manipulation of tools. The aim is to give
such instruction as the worker cannot well get
in the shops. It correlates with the daily shop
work and thus aids the workers with the great-
est economy, as the students are productively
employed and expensive laboratories and shops
are not necessary.

The beneficial effect of these continuing
schools on the development of industry and on
the condition of the working class has been felt
so keenly that the imperial government has pro-
vided for a fair share of the cost. The earliest study which she has given to the problem
of the nature of their trade. It often happens that these busy
day workers are too tired when night comes to benefit by such instruction, and week
ends.

The continuation schools found in Germany give instruction of a general character: they emphasize drawing, bookkeeping and
branches as are likely to be of value to
engaged in shop or factory work. For
they add embroidery, dressmaking, sewing,
milling, millinery, and accounting....

varia the work of the Industrial Continuation
schools is so specialized for individual trades
groups of trades that are really trade
continuation schools. Dr. Kerschensteiner,
chancellor of Munich, has been a force in
developing continuation and trade schools
Munich and throughout Bavaria. His is
always to make the students understand
materials on which they are working,
develop in them thought and wise action,
and is said that 30 trades are taught in the school
there.

The trade continuation and trade
proper usually differ from the Industrial Continu-
ation school in giving more specialized
instruction. An illustration of this is
work for boys is the Artisan School, etc.,
in Berlin. The aim is to "give to apprentice
and workmen, especially during their 1
hours, a knowledge of drawing and the
sciences and arts which are needed by the
active trades and which serve as the nec-
complement to their shop practice." All or
drawing, mathematics and sciences are spe-
ized in separate courses directly adapted to
the trade. The hours of instruction are
afternoon and evening of week days and
Sunday morning. All-day courses in
also given at this school.

Trade Schools with all-day work in a
trade are numerous, but are not always
attended. Schools of watchmaking, bask
making, cabinetmaking, horseshoeing, toy
and other trades have been opened in the
local needs. The following is a par
of the occupations provided for in the
schools:

Artisan Schools: carriers, bakers, barbers, basketmakers,
smiths, braziers, bookbinders, cabinetmakers,
chimney sweeps, cooks, carpenters, confections,
dressmakers, dyers, embroiderers (and machine), engravers, gardeners, ga
makers, glaziers, goldsmiths, hatters, dressers, handsewers, ironworkers, joiners,
loom weavers, leatherworkers, lock
laundresses, masons, modelers, mechanically
menders, milliners, paperhangers, painters,
togillers, potters, printers, rugmakers,
ners, spinners, stonecutters, stuccoworkers,
strawplaiters, shoemakers, tinsmiths,
truckmakers, woodworkers and carvers,
ners, wickerworkers, watch- and clockmak
wagonmakers, wheelwrights.

Trade work for girls in Germany is
extensively developed as that for boys.
sentiment of the German people, that
place is in the home, has caused these to
include instruction of a more general character.

The beneficial effect of these continuing
schools on the development of industry and on
the condition of the working class has been felt
so keenly that the imperial government has pro-
vided for a fair share of the cost. The earliest study which she has given to the problem
of the nature of their trade. It often happens that these busy
subjects, which prepare for clerkships or secretarial work, training stenographers, typewriters, etc.; (2) the domestic trades such as housekeeping, needlework, sewing, repairing and ironing, and (3) special trades for women, such as dressmaking, millinery, white work, art needlework, designing, bookbinding, composing and photography. In Berlin the nine municipal continuation schools for girls maintained by the city, and the Victoria Continuation School maintained by private funds, are typical schools of this character. They offer day as well as night work. The Women's Work Schools (Frauenarbeitsschulen) found in many cities, notably in Nuremberg, Bavaria and Reutlingen, Wurttemberg, are day trade schools as is also the Potsdam Trade School for Girls.

The Lette Society of Berlin has done much to foster trade instruction for girls. The aim of the society is the improving of the working class by (1) the removal of obstacles and prejudices in the way of female employment; (2) the fostering of commercial and industrial education; (3) the furnishing information for opening new learning and teaching situations and help where existing institutions are inadequate; (4) the establishment of exchanges for the exhibition and sale of women's handwork; (5) the protection of women against harm, morally or otherwise, especially regarding lodging houses. This society has opened a number of different kinds of schools. The trade courses range from four to six months of all-day work.

The Schools and Courses of Industrial Drawing and Art have made their curricula so practical that they adapt themselves directly to the various trades. There are also, in many instances, workshops in connection with these art schools, in order that the student may have practical experience of the value of his designs and plans. The building and textile trades and such art industries as the making of jewelry, metal and wood working, engraving, gold and silversmithing, painting on glass and china, ornamental designing and decorative painting, are especially considered in these schools.

Elaborately developed systems of special Technical Schools provide for all grades of positions in the building and textile trades. They touch to a small degree the problem of training an apprentice. These great day schools have been very successful. Over 50 of them are to be found for the building trades, and Prussia alone has eight for the textile trades.

There are three grades of labor in the building trades: (1) architects; (2) those who execute the architect's plans, and (3) the workmen. The evening continuation school sometimes provides for the lowest grade, and at other times the building trades school offers a special section. The textile trades have also three grades, and weaving workshops are provided for the apprentices, either in all-day work, or in evening and Sunday classes. In some of the textile schools women are admitted, the one at Aix-la-Chapelle offering an elaborate course of textile drawing, the girls being paid wages according to the value of their work. The School of Textile Art in Plauen, Saxony, has also a department for women. Instruction in embroidery and the making of lingerie is given, the aim being to train superintendents of workrooms.

Apprentice Workshops are organized both in connection with public trade schools and as private institutions. They aim at a more comprehensive training than is obtained in the ordinary shop. The Krupp Steel Works at Essen offer a complete course of apprenticeship.

Itinerant Trade Courses are also provided in such industries as weaving, garment cutting, embroidery, machine work, saw plaiting and bookkeeping. These courses have been beneficial in small towns where there are cottage industries.

The effort of organized labor to preserve handwork and the small trades has been of vast service in Germany in the development of trade schools. The various trade guilds have dealt carefully with the subject of apprenticeship and have been uniting in their efforts to have favorable conditions attend such instruction.

BELGIUM.

Education is not compulsory in Belgium, but the schools are well attended. The primary school is followed by an excellent system of trade education for both sexes. In particular the schools are similar to those in the neighboring countries, but they also present characteristic features. For boys the elementary trade schools are followed by superior trade and technical schools, and those again by the great technological institutions.

Trade-instruction is carried on in the industrial schools (écoles industrielles) and in the trade schools (écoles professionnelles). The first gives theoretical instruction in industrial operations with practical courses in design. The second gives trade work combined with theoretical instruction, has all-day sessions, and is the trade school proper, although many of the écoles industrielles have trade sections.

Trade training of an elementary grade is given in the following institutions:—For boys: Industrial schools, trade schools, Saint Luke trade schools, apprentice shops, trade courses. For girls: Trade schools (including trade schools proper, trade and housekeeping schools, housekeeping and trade schools), trade courses, apprentice shops.

The length of the courses in the trade school proper is from three to five years. The trade schools for girls were organized before those for boys. They offer the most advanced form of trade education for girls. The industrial school is the largest and most important class of institution in Belgium for the training of young men. As these latter schools are supplementary to the trade and do not give regular trade instruction, and as their courses are given at hours when workmen can attend, they resemble the continuation schools of Germany. The number of these schools is rapidly increasing.

Trade instruction in Belgium is justly renowned for certain features: (1) The excellent system of economical administration and wise supervision; (2) the thoroughness of its instruction in general education applied to the various trades and also in the teaching of the trades; (3) the importance of art in all of the schools and the practical use made of it in designing in each of the trades; (4) the adaptation of all of the trade work to local needs.

The trade schools are with few exceptions
under government control, although no general law governs their formation. Schools have been established by communes (écoles communales), by private individuals (écoles libres), and by provinces (écoles provincales). Complete liberty of organization is allowed to local authorities or to private individuals, in order that the schools may be adapted to local needs. This freedom has made these schools really local institutions, conforming to no uniform model. A system of subsidizing them has been devised. A certain sum of money is voted annually for this purpose, and placed at the disposal of the minister of industry and labor. When the schools desire a portion of this appropriation they must submit a formal application, accompanied by details of their work which will enable the ministry to judge if the school should receive assistance.

The government exercises regular supervision over schools receiving the subsidy. Each year they must send to the ministry for approval of their accounts, their budgets for the ensuing year, and any changes in their organization or in their programs. The supervision of these schools is most efficient. An inspector general of industrial and trade education is at the head, and under him is an expert corps of inspectors. Inspections are also made by such provincial or communal authorities as aid in the support. Religious bodies, industrial organizations, and private individuals also help these schools. Some of the schools give free instruction, some require an entrance fee, and others charge for tuition. Students who are too poor to pay for instruction or to attend even when it is free are aided in various ways.

The difference between a manual training and a trade course is very marked in Belgium. The trade schools may differ in characteristics, but they all keep strictly in view the fact that they are preparing students to earn a living in some particular branch of industry. Drawing and industrial design are at the base of all instruction for girls as well as for boys, and are taught with reference to their use in particular trades. A practical general education is also considered a necessary part of the instruction in the trade, and usually occupies the first half of the day. Libraries, museums, collections of scientific apparatus for demonstration, public exhibitions, and provision for traveling scholarships are means used to develop the highest efforts of students.

The provision made for teaching girls is very thorough. The Trade Schools proper (écoles professionnelles) have programs in theoretical as well as in practical work. There are at least 50 of them in the kingdom. The aim is to teach such trades as are open to girls, and at the same time to carry forward the regular school education. The trades taught are dressmaking and cutting, waistcoat- and corset-making, fine lingerie, millinery, artificial flower-making, industrial drawing and ornamentation, embroidery, designing for lace and embroidery, and painting on glass, china or silk. Commercial courses are also given. The general course, with emphasis on French, German, and Flemish languages, arithmetic, history, geography, hygiene and domestic economy, writing, drawing, singing and gymnastics. The instruction is excellent and has been especially adapted to the trades and to the needs of women in their households. A high place is given to domestic economy in Belgium. Its full development is in the housekeeping schools (écoles ménagères), but some of it is required in the trade schools also. The trade courses for girls vary in different schools according to the needs. The length of the course is usually three or four years, but five years are sometimes required.

The pioneer trade school for girls in Belgium is the Bishofshem, 94 Rue de Marsa, Brussels, established in 1865. The age of entrance is 12 years, and the length of the course is four years. The trade courses are numerous and well taught. The courses in drawing, including designing for lace embroidery and garment decoration, painting on glass, porcelain, china, fans and textiles, and the dressmaking and the artificial flower-making are especially notable. The reception room at this school is decorated with fine examples of porcelain tiles and china painting, and the windows are of stained glass, this work all having been done by graduate students. The Communal Trade School for Girls on the Rue du Président, Brussels, is noted for the fact that the trade instructors is also the teacher of the course in design in connection with the trade. The course in embroidery and applied design is especially fine. Another Brussels communal school on the Rue du Poineon, 26, noted for its dressmaking and commercial courses, and the Antwerp School, Rue des Architectes, with its five-year courses in some of the trades, are also examples of the excellent professional training for girls in Belgium.

An advanced trade course of one year for dress designers, dressmakers and intending teachers in trade schools is given in Brussels, a study of the evolution of dress in all countries being a notable part of the work.

The Trade-Housekeeping Schools (écoles professionnellles-ménagères) and the housekeeping-trade schools (écoles ménagères-professionnelles) are also giving more or less time to trade work.

Apprentice Shops for teaching trade work: girls are not numerous, but are doing good work. They were opened in response to local needs rather than as a part of regular trade instruction. One of their distinguishing features is that the students after a time receive financial remuneration for their work. There are several of these schools, as the one at Borsbeke for straw plaiting and straw-hatmaking, at Jemelle for lingerie and dressmaking; at Maldegem for hand and machine embroidery and crochet work on tulle, and at Saint Trond for lacemaking.

The Industrial Schools (écoles industrielles) for boys are similar to the continuation schools of Germany. They are very numerous in the parts of the country and have been organized with reference to local needs. They take a large number of technical subjects connected with the trades which the boys follow during the day. Some of these are also day trade schools and have advanced, as well as elementary work. The general course, with emphasis on French, German, and Flemish languages, arithmetic, history, geography, hygiene and domestic economy, writing, drawing, singing and gymnastics. The instruction is excellent and has been especially adapted...
weaving. The Industrial School at Tournay, which is one of the oldest and most important in Belgium, also partakes of the nature of a technical school. It has no scope of its own, but it has entered into contract with local manufacturers to direct the pupils' practical education. This is an excellent method of combining theoretical with practical instruction. The school gives its theoretical instruction in the early morning or in the late afternoon. The Industrial School of Morlanwelz has departments of mining, building construction, engineering, electricity, shop technology and mechanical drafting. The organization of the school population, the equipment, the excellence of the instruction and the ability of the teaching force make this school a power in the kingdom. The age of the students entering is from below 14 to over 20. The schools of Ghent, Seraing, Châtelet, Charleroi, La Louvière and many other cities are adapting themselves to local industrial conditions and are doing good work. Certain work in the industrial schools is also open to girls, but, with the exception of the commercial courses, it is not well developed.

The Trade School proper for boys is also well developed. Under this head are the day trade schools (for teaching actual trades), the trade continuation schools (for supplementing the day shop work), and the trade schools of fishing. Some of the day trade schools teach but one specific trade, while a number of trades are taught at other schools. An illustration of the first class is the Brussels Trade School of Tailoring. A four years' course is offered. The leading tailoring houses of the city show their interest in this school by contributing to its support, supplying it with order work and helping to place the graduates. The students pay a small entrance and tuition fee. They are paid a small sum for their work, and this money is placed in the state savings bank and given to the student when he completes his apprenticeship, but if he leaves the school before that time he loses the right to the money. The Gun Makers School at Liege for making arms was originally begun by the manufacturers but is now conducted by a committee composed of labor men, city officials and manufacturers. The school is open day and night.

The T. Nicaise Trade School of Metal- and Woodworking at Ghent is an illustration of the class of school offering instruction in several trades.

Jewelry work, chasing, upholstery, furnishing, printing and many other trades are taught in evening or in Sunday morning continuation classes. The trade schools for fishing are placed at the seaports.

The Saint Luke Trade Schools are similar both to the day trade school and to the trade continuation school. They aim particularly to train for artistic branches of the handicraft trades. They were established by the Roman Catholics. The school at Schaerbeek, Brussels, is an illustration of this class of trade school.

Apprenticeship Shops have been organized for weaving and stone cutting and are doing successful work.

France.

France began to plan and legislate for the training of her handworkers centuries ago. The forerunner of the trade school began in 1799, but the great development of the subject has been during the last quarter of a century, following the Paris Exposition of 1900. The number of such schools receiving help from the government increased from 48 in 1880 to 292 in 1904. France appreciates that her industrial success depends on the education of her workmen, hence the government takes a direct part in developing the system of trade instruction. Schools are provided to teach all grades of workers from the semi-skilled artisan in the ordinary trades to the engineer for the more advanced scientific and technical work. Trade training is always founded directly on primary education, design is considered fundamental and a large amount of shop work of a practical nature is given.

Manual apprenticeship schools have been organized to give boys instruction in their chosen industry or to fit them for the secondary technical schools. There are four national trade schools (écoles nationales professionnelles), situated at Armentières, Nantes, Vierzon and Voisins, and 32 trade and industrial schools (écoles pratiques de commerce et d'industrie), 26 for boys which are situated in various parts of France, and six for girls at Boulogne-sur-Mer, Havre, Marseilles, Nantes, Rouen and Saint Etienne. In addition to these, the municipalities of important cities have established schools for the elementary teaching of trades, industries and arts. Religious bodies, societies, business enterprises and private individuals, encouraged by the success of the national and municipal schools, have likewise organized instruction for the improvement of the artisan.

Government control requires that the schools receiving subsidies should all conform to certain requirements. The Practical School of Industry at Saint Etienne (école pratique d'industrie) may be taken as a type of these institutions. The trades of weaving, modeling in wood, machine fitting, calainemaking, electricity and gunmaking are taught here. The work is on an elaborate scale, the course being four years in length. The first year is preparatory and completes the student's primary education while also giving him shop practice of various kinds to discover his aptitude for any trade. During the next three years, he is trained both practically and theoretically, and continues his general education which is closely adapted to his trade needs. Here, as in other schools, much emphasis is laid upon the study of art.

The greatest and most progressive system of municipal trade schools is in Paris. The Diderot School was the first one organized, having been established in 1872 for wood and metal work. The courses are three years in length, entrance being by examination. Practical work occupies the greater part of the day, but considerable time is given to drawing and theoretical instruction. By an ingenious arrangement a first-year student is put between a second and third year student that he may profit by their experience. Apprenticeship is made the subject of a tax on the city from the fact that the products of the classes are sold. The Boullé School trains skilled artisans and mechanicks in wood and metal. The furniture construction is justly noted. The products are artistic as design is
especially emphasized. The course is five years in length, primary academic instruction, trade work, technical art and a scientific course being included in its curriculum. Schools of printing and publishing, applied physics and chemistry, industrial art and industrial drawing are also supported by the municipality of Paris.

There are six municipal trade schools for girls in Paris. The instruction includes art, academic work and the chosen trade, and all courses are either three or four years in length. The trades taught are similar to those in Belgian trade schools for girls. The aim is to educate for a trade, to develop the intelligence of the workers, and to teach them to be self-reliant and resourceful. The French schools execute practical order work in their departments, and every trade school in Paris has its clientele. The model for these municipal schools is the private school begun in 1864 by Elisa Lemonnier. There are two of the Lemonnier schools in Paris at the present time. They offer courses of four or five years in length.

The training for girls in the practical sciences and industry (mentioned above) is similar to that offered in the Paris municipal schools. Schools are also organized which offer both home-making and trade. These are well patronized as many women desire both subjects.

UNITED STATES.

The United States had not many examples of the all-day trade school until recent years, for her problems of national development had taken her full time. The beginnings were usually under private control—expressed in the New York Trade School for Boys and the Manhattan Trade School for Girls. The subjects of instruction at the former are the various building trades such as carpentry, bricklaying, sheet metal and cornice work, electrical work, house and street painting, plumbing, steam and hot water fitting, sign painting, plastering, blacksmithing and printing. It was founded in 1881 by the late Col. Richard T. Aechmuty, who originated the system of instruction. The school is open to both sexes and is the practical branches of the trade. The courses are made as short as possible—usually about four months for the day classes, which provide trades for younger men. The night courses aim at giving additional skill to those already in the trade. The students come from all over the United States, and several thousand have received the certificate and twice as many more have been enrolled. It is claimed that this school has greatly helped the building trades and also has raised the standard of intelligence and efficiency in the working class. The Baron de Hirsch Trade School, also in New York city, offers similar trade training.

The William-on Free School of Mechanical Trades, near Philadelphia, is a different type of trade school. The course is three years in length and the school term extends throughout the year. The pupils are regularly indemnified as apprentices and live at the school. Scholarship examinations are held for admission, and there is no charge for board, clothing or instruction. The trades taught are carpentering, bricklaying, including rance, furnace and boiler-setting, and the machine trade in all of its usual details, patternmaking, steam and electrical engineering and steam fitting. Each student takes but one of the trades named, and the work taught is in the direction of the particular trade. The academic work continues throughout the three years, and special attention is given to ethical training that the pupils may be good citizens as well as good mechanics. It can accommodate but one-fifth of those desiring admission. There are three notable trade schools in San Francisco. The Wilmerding School of Industrial Arts trains for the building trades, the Lux School offers girls home-making and wage-earning courses and the Lick School of Mechanical Arts gives the metal trades. All three schools are under the same principal, though financially independent. There is no charge for tuition, use of tools, instruments or materials. The courses cover four years and the aim is to send intelligent citizens as well as well-instructed workmen into the trade. Graduate courses are also given. The schools are built on adjacent lots and the students can use the shops of either institution. They are free, and the latter is open to both sexes. A competitive examination is held for entrance at the School of Mechanical Arts. A preliminary course of more than two years in general education and manual training is followed by the selection of some trade and apprenticeship in it. The school aims to solve a general problem of teaching various trades as an integral part of education, rather than to meet some special need of the community.

The Wentworth Institute in Boston trains for various skilled mechanical trades in both day and night classes. Like other schools of its type it was of great service in training men for war occupations during 1917 and 1918.

The Carnegie Technical Schools of Pittsburgh offer trade work on a large scale to both sexes as a part of a broad plan of technical instruction. The School for Apprentices and Journeymen gives classes for those already at work. The instruction is both theoretical and practical, with the object of turning out skilled mechanics. The Technical School for Women offers training in home-making and also in wage-earning pursuits.

The Manhattan Trade School for Girls in New York city is a short-time all-day preparatory trade school. It trains for skilled trade work. It is a pioneer school in this class of education and was begun in 1902 under private control, passing into the public school system in 1910. The aim is to shorten the period of apprenticeship of those girls who leave the public schools to go to work, and to create in them an appreciation of the meaning and value of their trade and its relation to the work of the world. The school is open throughout the year, students may enter at any time, are on probation for a time, and each is advanced according to her ability, hence there is no definite length of course; experience has shown that it may be anywhere between six months and two years. The trades offered are: (1) Those with reference to the metal, such as dressmaking and millinery; (2) those that use foot-power and electric-power machines, including such machines as those for embroidery, hemstitching and buttonholes; (3) those
that depend on the expert use of paste or glue, such as labeling, sample mounting, pocket-book and card-casemaking, library outfits, blank book covers, and novelty boxmaking. Practical academic work, as well as drawing and color, are also taught, but always with an eye single to their bearing on the needs of each trade. A certificate is given only after a girl has been tested in a position and has shown her proficiency and also a good spirit in the workroom. The tuition is and in especially deserving cases some financial aid may be given to pupils. The school has the cordial support of some of the foremost philanthropists, trade unionists, social workers and employers of labor of New York city. The Boston Trade School follows closely the plan of the Manhattan Trade School for Girls. It was begun in 1904 and taken over by the city in 1908. Similar trade schools for girls adapted to their communities are found in other cities, Worcester, Massachusetts and Milwau- kee being so noteworthy. Some notable schools for specific trades are to be found all over the United States. The Brewers’ Schools of New York, Chicago and Milwaukee; the Schools of Watchmaking and Repairing in Waltham, Mass., and the Bradley Polytechnic School in Peoria, Ill., and the Barbers’ Schools in Nebraska and other States are instances. Shipbuilding, photography, linotype and many other trades are taught in this class of school.

Business enterprises have also opened trade schools. Many of the institutes for dress-making, so numerous in the large cities, were organized by some firm to teach a special system of drafting patterns.

The Apprenticeship or Corporation School is also found, being represented by such instruction as is given their workmen by the school of Messrs. R. Hoe and Company, manufacturers of printing presses, and the Carriage Builders’ National Association (both in New York city), the Ladies’ Home Journal, Philadelphia, the General Electric Company, at West Lynn, Mass., and great railroads, such as the New York Central and the Atchison, Topeka and Santa Fé.

Night classes for teaching trades are to be found in connection with the work of social and religious bodies. The Saint George’s Trade School of New York city belongs to this class. The Catholic Prosectory, near New York city, is teaching numerous trades for both sexes as a part of its scheme of reformation, and similar work is done in other institutions of this character.

Trade or technical teaching in institutions with other educational aims is found frequently. The pressure to introduce this work has been so great that trade classes have been offered in a variety of places, some of them receiving State or Federal aid. Much of the instruction is of a supplementary character, to take the place of apprenticeship. The technical features are usually more prominent than the special shop practice. Pratt Institute, Brooklyn, offers classes which resemble those of the trade continuation schools. The fundamental aim of the institute is for “industrial and technical instruction,” but it has responded to the call for two-hour night classes to train boys for carpentering, machine work, plumbing and fresco painting. Trade classes for girls are also given. The technical classes are justly noted, but they do not aim to prepare apprentices for the trade. The Drexel and Spring Garden institutes in Philadelphia, the Mechanics Institute in Rochester, the Hebrew Technical institutes for both sexes and the Clara de Hirsch Home in New York city and the Christian associations are instances of institutions with other aims giving attention to trade instruction.

The great schools for the colored people and Indians have been foremost in inaugurating trade education as an adjunct to their academic or normal aims. The Hampton Normal and Agricultural Institute in Virginia, the Tuskegee Normal and Industrial Institute and the Agricultural and Mechanics College in Greensboro, N. C., are examples of these schools. They have developed for both sexes almost all of the leading trades. The work is given in the most practical manner, as the shops are for productive industrial work, not for training instruction. Trade teaching in these schools has been placed on a high ground and the results have justified the wisdom of the methods chosen.

Continuation, co-operative and part-time classes are increasing in number. Massachusetts, New York, Wisconsin and Indiana have been foremost in enacting laws to further vocational education and have organized various forms of trade classes to help their working people. Other States are following rapidly. Department stores are using the continuation schools for training their sales-people and are also organizing part-time classes in their own buildings. In Massachusetts the trade schools in Beverly and Fitchburg have begun an inter-relation with the industries in their towns and the school in part-time instruction. Vocational work in the later grades of the school is rapidly increasing and serves to guide young workers into occupations suited to their ability, thus preparing them for entering trade or taking further training at a school.

The passing of the Federal bill for vocational education gave a great impetus to training boys and girls below college grade for trades and industries. The object of the measure, stated tersely, is to promote training in agriculture, trades, industries and home economics, and also to train teachers for vocational positions. The Federal board is also authorized to make investigations and to send out reports. It supervises and controls the work it assists, and works in connection with the State boards—the Federal and State boards acting as an agent. During the European War (by special legislation) it prepared men for various branches of war work and is still giving training to disabled soldiers, sailors and marines.

Austria.

The Austrian government has developed an exceptionally logical system of trade instruction for both sexes. The legislation in regard to fostering handicrafts has been similar to that taking place in Germany and has had a great effect on the development of trade training. The schools of all grades are carefully classified and grouped. Classes for trade is given in schools for particular trades and in the industrial continuation schools.
TRADE SCHOOLS

Another group, known as the Central Industrial Educational Institutions, which are most of them in Vienna, have for their function the promotion of industrial education and to serve as models for other branches of the empire. Some of these schools offer both a lower and a higher trade education in connection with their other important lines of investigation.

The Schools for Particular Trades are very numerous. There were about 100 state schools and more than half that number of private or state subsided schools in the report of 1899. Important examples of this class are the schools for lace work and hand and machine embroidery in Dornbirn and Laybach; for weaving in Reichenberg, Vienna, Schönberg and Warnsdorf; for wood, iron and stone work in Bergreichenstein, Bozen, Chrudim, Bruck aus der Mur and Laas; for earthenware and glasswork at Teplitz and Oberentensdorf; for metal work in Klagenfurt, Swistiniki and Nizza and for other trades in Gabling, Turnau and Karlsbad.

The Industrial and Trade Continuation Schools are also extensively developed and are similar to the German models of the same name. They have reached their highest development in Vienna. A great central school enrolls about 8,000 pupils. The school is open for 10 months, six days a week. The work is compulsory for four years for both sexes. A watch and clock making all-day school is in the same building.

SWITZERLAND.

The Swiss are an industrious and practical people and their schools show the national characteristics. This country has the distinction of having provided the model for the first French trade school. As early as 1599 Saint Francis de Sales conducted a school which maintained an industrial section. The Duke de la Rochefoucauld, while traveling in Switzerland, heard of the school, and, at his own expense, founded a similar one in France, which later became a National School of Arts and Trades.

The Federal government has developed an excellent system of subsidizing and supervising trade schools. The continuation school is the favorite, and they are similar in character to those of Germany, though the special trade features are not so well developed. They are found in all of the cantons and are for both sexes.

The Industrial Art Schools are giving training to apprentices in the trade, as well as advanced instruction. The cantonal School of Industrial Arts at Geneva, devoted purely to the art industries, and the Trade and Industrial Art School in Bern, combining other industries with its art work, are examples. Certain classes in both of these schools are open to women.

The Trade Schools proper cover a wide field of occupations. Of those teaching a simple trade, the watchmaking schools are the most numerous. Woodworking, embroidery, and weaving schools are also characteristic of Switzerland. Many of the schools teach several arts. The course is usually three years in length and includes such art and academic work as is felt to be necessary for the under-

standing of the trade. These schools have had for their models the German, Belgian and French institutions of a similar character. The art work is generally less notable, however. The cantons of Appenzell, Bern, Genoa, Neuchâtel, Saint Gall, Soleure and Zürich have successful trade schools as well as apprentice shops.

Trade instruction for women is also well developed. Many of the trade schools include the housekeeping element; as is the case in Germany and France. The Trade and Housekeeping School (école professionnelle-ménagère) in Geneva offers a three-year course. The work produced resembles the French in precision of technique and beauty of execution, but has, perhaps, less artistic value. Of the trade schools proper a good example is the school for ladies' tailoring and lingerie making at Zürich. Pupils must be over 14 years of age and present certificates showing a good general education. Courses of three or four years are offered, which include practical work at the chosen trade, theoretical instruction concerning it, auxiliary academic subjects, drawing and drafting and at least six months' service in the salesroom connected with the school. The Bern Women's Handwork School (Frauenarbeitersschule) also gives trade training, but does not at present include art or academic work in its curriculum.

Schools for housekeepers and servants have been developed in Switzerland and give excellent courses of several months' duration. All of the ordinary work of housekeeping, cooking, baking, preserving, serving, cleaning, sewing, repairing, washing, ironing, gardening, sweeping and putting rooms in order is included in the course. An effort to lengthen the time of training is being made. Lenzburg, Bern and Boniswil have good schools of this class.

The Swiss trade school is felt to have a beneficial effect on the working man and woman as well as on the industries, and is favored by the labor unions. Although the schools have not created new industries, they have been the means of developing many. The schools of wood-carving have done much to impart this trade, and machine work, taught in the schools, brought prominently forward. The products of this industry are largely exported to the United States.

ENGLAND.

The trade school proper was not developed to as great an extent in England as on the Continent. Although technical education has received attention, there have been until recently but few instances where the day schools aimed to take the place of actual apprenticeship. This was due largely to the Education Act of 1899, which forbade the practice of any trade, industry or employment in the schools. The education acts later took a more favorable attitude toward trade instruction, and government aid can now be given for fostering such schools. They are rapidly increasing.

Supplementary trade work is largely offered in the night continuation classes, which resemble those of Germany, and attract large numbers of students. There are about 80,000 in London alone. Mr. Robert Blair of the Money Educational Commission, says in his report on
technical education in the United States: "We are in the main trying to do in one institution — the evening school — what Germans and Americans are in the main endeavoring to do in two.\textsuperscript{8} The night classes are open to both sexes. Girls do not take much advantage of them, however, for the reason that nine or 10 hours of work during the day leave but little energy for resuming workshop practice. Although the polytechnics have done much for the industries, they are not of the type that has fostered real trade instruction in the day classes. Such instruction, however, has recently been increasing. A late report gives the number of day trade students in or near London as 5,800. These are provided for in 35 well-equipped workshops (principally in the polytechnics) in which 200 courses are given bearing on 33 different trades. The evening classes are doing a fine work in training older workers for better positions. Day preparatory trade schools are being organized. Engineers of high rank are urging educational facilities for apprentices, workmen and experts equal to those offered on the Continent of Europe.

Trade training for girls has not been greatly encouraged by the working class. The germ of it has been the excellent domestic economy schools. The Women's Industrial Council of London is doing much to foster trade schools for girls as a part of education. The London County Council has opened an All-Day Trade School of the apprenticeship type. It began under private control but was taken over by the city in 1907. A girl can enter at 14 and remain two years. A day continuation school has also been opened for girls at work. The Borough Polytechnic in London opened in 1904 Day Trade Waistcoat-Making School for Girls, and other polytechnics have followed the example. General education, art and domestic science are included in the one-year course. The council is urging that similar day courses be offered at each technical institute in London, in order to train workers for all good trades employing women.

ITALY.

Education for industrial pursuits began seriously in Italy after the national union. In 1898 vigorous reforms took place in the schools which raised the standard of teaching and reorganized the courses of study. The schools were founded chiefly by individuals. They differ widely in type, in object and in program. Many of the schools receive subsidies from the state as well as from the provincial or communal authorities, or from chambers of commerce, or from the savings banks. The government exercises a certain class of supervision over those schools receiving subsidies. Although there is no co-ordination between the schools there is a response to local needs. As in other countries, there are several grades of schools. The schools of arts and trades (scuole d'arti e mestieri) train the workmen. There are very numerous in cities and small towns, and are unevenly distributed through Italy. Piedmont, Lombardy, Campagna and Tuscany have the greater number. The instruction in many of them deals more with the technical features than with the academic and theoretical. As in other conti-

TRADE UNIONS, as defined by the Federal statutes, are associations of working people for the several purposes of aiding members toward greater efficiency, promoting their general intelligence, raising of funds for the benefit
of sick, disabled or unemployed members or the families of deceased members, and for the regulation of their wages and hours and conditions of labor, and the protection of their interests. Rights in the benefit funds of the trades. The primary object was to assist members in contest with employers, and it was not for some time later that the unions introduced funeral benefits, homes for incapacitated workers, scholarships, etc. See American Federation of Labor; Guilds; Unionism.

TRADE UNIONS, General Federation of, a labor organization of Great Britain, aiming to unite all the British trade unions for mutual assistance and the advancement of the interests of labor. It admits any trade union to membership, but no branch or individuals. It was organized in 1899 at a special session of the British Trades Union Congress. The government is vested in a general council of representative delegates meeting annually, and in an executive "management committee" of 15, no two to be of the same trade. District committees may also be organized. Any union dissatisfied with the management committee may appeal to the council, and from the council to the vote of the general membership. The federation deals solely with industrial questions, particularly with the conduct of strikes, and aims to preserve industrial peace. All unions joining the federation pay an entrance fee of one penny (two cents) per member and regular dues are paid on two different scales, the higher scale, sixpence (12 cents) per quarter per member, the lower scale, threepence (6 cents) per quarter per member; all payments are calculated on 90 cents per member. In case of a strike approved by the general council or the management committee, unions that have belonged to the federation 12 months are entitled to a strike benefit of five shillings ($12.50) per week per member on the higher scale, and half that amount on the lower scale. Several large and representative unions have joined the federation; among them are the Amalgamated Society of Engineers, the Boot and Shoe Operatives, the Cotton Spinners, the Shipwrights, the Tailors and the Gas-workers and General Laborers. The membership approximates 1,000,000. See Unionism.

TRADE WINDS, one of those perpetual or constant winds which occur in all open seas on both sides of the equator, and to the distance of about 30° north and south of it. On the north of the equator their direction is from the northeast (varying at times a point or two of the compass either way); on the south of the equator they proceed from the southeast. In some places the trade winds become periodical, blowing one-half of the year in one direction and the other half in the opposite direction. They receive their name because their known regularity is an assistance to trading vessels which often lay their courses so as to receive as much assistance as possible from favorable breezes. See also Currents; Ocean; Meteorology.

TRADING STAMPS, printed slips given by some merchants as an inducement to the trade. They are not三年级 that they may be pasted in a book which is furnished and which when filled has a value in premiums offered. These stamps are used extensively and are said to be of considerable value in working up trade. They have been the cause of lawsuits brought against the issuing firms under the law forbidding lotteries.

TRADITION, the body of oral information, opinion, inexact records, statements, and evidence of things long past communicated from older generations to the present. That evidence of ancient things which is not committed to writing and vouched for by competent authority. As applied to profane history it signifies knowledge of the past handed down by word of mouth from generation to generation. In this sense the line between tradition and myth is often hard to distinguish, one merging into the other. Historical tradition, however, has usually, if not invariably, a substantial foundation and both tradition and myth are of the highest value in tracing human experience and progress both in the historic and prehistoric periods—for it should be unnecessary to state that the so-called historic period is not a uniform era, but varies with different races of mankind, according to the age at which they come within the range of historic observation.

Tradition in the religious sense holds a place not less important than in its profane meaning. It is a chief ground of doctrinal division in Christianity and also in Mohammedanism, between Roman Catholics and Protestants in the former faith and between Sunnites and Shiites in the latter. A similar division is common among the Jews of the later Scriptural period. In the Roman Catholic view the term tradition is applied to the doctrines believed to have been communicated by Christ to his Apostles and handed down by them orally to their successors. The writings of the Fathers are regarded as witnessing these traditions. The Council of Trent teaches that the truth of Christ is contained partly in the sacred writings and partly in the unwritten tradition received by the Apostles from Christ, or from the Holy Ghost, and entrusted by them to the Church, and that Scriptural and apostolic tradition are alike to be revered. See Catholic Church; Jewish Sects; Mohammedanism; Protestantism; Shiites; Sunnites.

TRADUCIANS (from traduce, transmit), a name which the Pelagians anciently gave to the Catholics because of their teaching that original sin was transmitted from father to children. More commonly the term is applied to the theory that souls are transmitted to children by the parents, instead of being created by God. Saint Augustine appears to have inclined to this belief, without committing himself to it.

TRAFALGAR, trä-fäl-gär', or trä-fäl-gär', a cape on the southwest coast of Spain, at the northwest entrance of the Strait of Gibraltar. It is low and sandy and terminates in two headlands, on the east of which is a lighthouse. The famous naval battle in which Nelson lost his life, after defeating the combined French and Spanish fleets under the command of Villeneuve and Gravina, was fought off this cape on 21 Oct. 1805. A monument was erected on the summit of the capes. (See J. S. 'The Campaign of Trafalgar' (London 1918).
TRAGACANTH, GUM TRAGACANTH, GUM TRAGIC, a gummy exudation from the stem of various species of Astragalus, natives of the mountainous regions of western Asia. It comes on the market as irregular leaves or ribbon-like pieces, of a white or brownish-white color and somewhat translucent. It swells up in water; does not readily dissolve but forms a gelatinous mass which is sometimes utilized as a mucilage. Used in pharmacy to give consistence or pell-mell mass. It is also used to stuff calicoes and other fabrics.

TRAGEDY, a serious drama or poem, representing an important event or a series of events in the life of some person or persons, in which the diction is elevated and the catastrophe melancholy. Tragedy originated among the Greeks in the worship of the god Dionysus or Bacchus. See DRAMA.

TRAGOPAN, a pheasant of the genus Ceriornis, closely allied to the common fowl. C. satyrus, a common species, is a native of the Himalayas where it inhabits the forests at 8000 to 11,000 feet elevation. The plumage is spotted, exceedingly brilliant and variegated in colors and two flesh protruberances hang from behind the eyes. When the bird is excited it can erect these protruberances till they look like a pair of black male hares at either side of the lower mandible. Unlike most pheasants they build their nests in trees.

TRAILL,trail, Catherine Parr Strickland, Canadian writer, sister of Agnes Strickland (q.v.): b. London, 9 Jan. 1802; d. Lakefield, Ontario, 29 Aug. 1879. She was married in 1832 to Capt. Thomas Traill with whom she removed to Canada in 1833 and made her home for the rest of her life at Lakefield, Ontario. Among her works are 'The Backwoods of Canada' (1835); 'Canadian Crises' (1852); 'Ramblings in the Canadian Forest' (1854); 'Afar in the Forest' (1869); 'Studies of Plant Life' (1884); 'Peals and Pebbles' (1895).

TRAILL, Henry Duff, English journalist and man of letters: b. Blackheath, Kent, 14 Aug. 1842; d. London, 21 Feb. 1906. He was graduated at St. John's, Oxford, 1864, called to the bar in 1868, but soon took to literature. He was connected with the Pall Mall Gazette (1873-80), the Saint James' Gazette (1880-82), Telegraph (1882-96) and the Saturday Review (1883-94). From 1889 to 1891 he was editor of the Observer, from 1898 to 1900 of Literature. Among his publications are 'Lives' of Stradford (a very original work with a new view) (1889); 'William III' (1888); 'Sterne (1882); Coleridge (1884) and others; also 'Central Government' (1881); 'Recaptured Rhymes' (1882); 'The New Lucian' (1884; revised and enlarged 1900), his best work; 'Saturday Songs' (1890), satirical verse; 'From Cairo to the Soudan Frontier' (1896) and 'The New Fiction and Other Essays on Literary Subjects' (1897).

TRAIN, Elizabeth Phipps, American novelist and translator: b. Dorchester, Mass., 1 Sept. 1856. She was educated at Wells College, Aurora, N. Y., and her first literary work consisted entirely of translations from the French. They include 'The Apostle' (1889); 'Recollections of the Court of the Tuileries' (1891), etc. Her first original publication was "Dr. Lamar" (1891) and she has since written 'Autobiography of a Professional Beauty' (1895); 'A Social Highwayman' (1895); 'Queen of Hearts' (1897) and other works.

TRAIN, George Francis, American financier and eccentric author: b. Boston, 24 Mar. 1829; d. New York, 18 Jan. 1904. In 1850 he was put in charge of the Liverpool branch of an American business house and three years later was admitted to partnership. Another branch was established in Melbourne, Australia, in 1853, under his supervision, and during the three years of his stay there he introduced a sailing-ship service between Boston and Australia. In 1858 he interested English capital in the building of the Atlantic and Great Western Railway and afterward undertook street-railway enterprises in England and other European countries, but his plans, through opposition and otherwise, were frustrated. His next railroad enterprise was the building of the Union Pacific Railway, for which was broken at Omaha 2 Dec. 1863 and the connection that linked the eastern and western extremities completed 10 May 1869. He made a tour of the world in 80 days, arriving in Marseilles, France, 20 Oct. 1870, where he organized the Commerce, was arrested and imprisoned for 13 days at Lyons. In 1872 he became an independent candidate for President of the United States. He was a man of eccentric habits and extravagent speech and in November 1872 was arrested on the charge of having published obscene scene literature. The passages objected to were wholly quotations from the Bible. Mr. Train was discharged from custody after having been adjudged insane by legal decision. His later years were spent in New York, where he adopted the habit of speaking only to children. He called himself "Citizen of the World," and while his title to property valued at $30,000,000 at Omaha, Neb., remained in litigation he affected a simple style of living and spent his last years at a cheap hotel, where he died. Among his publications are 'An American Merchant in Europe, Asia and Australia' (1851); 'Young America Abroad' (1857); 'Young America in Wall Street' (1858); 'Young America on Slavery' (1860); 'Champion of Women' (1868) and 'My Life in Many States and in Foreign Lands.'

TRAIN BANDS, a body of citizens partaking of the nature of both militia and volunteers, instituted by James I and dissolved by Charles II. The term was afterward applied to the London militia, from which the third regiment of the line originated and in which the renowned John Gilpin was a captain.

TRAJAN, traj'an (MARCUS VELIPIUS TRAJANUS), Roman emperor: b. Italic (near Seville), in the Spanish province of Bética, 53
A.D.: d. Selinus, Cilicia, 17. He was the son of Trajanus, a Roman commander under Vespasian. He accompanied his father in a campaign against the Parthians and also served on the Rhine with such ability that when Nerva came to the throne he adopted the young soldier and raised him to the rank of Caesar (97). Nerva dying a few months after, he succeeded to the throne (98). He was at that time in Germany, where he remained for more than a year, to settle a peace with the German tribes, and in 99 set out with a numerous escort to Rome. After largess to the soldiers and people he took successful measures for supplying the capital with corn. He punished and banished informers, reduced the taxes and filled the most important posts with men of talent and integrity. He moreover founded libraries, and under his patronage the studies were revived which had suffered from the persecution of Domitian. By the unanimous voice of the Senate he was awarded the title “Optimus.” In 101 he set out on an expedition against Decebalus, king of the Dacians, who had forced Domitian to purchase peace by an annual payment of money, and after two years defeated the Dacians and returned to Rome to enjoy the honors of a triumph with the name of Dacicus (103). In this year Pliny was made governor of Pontus and Bithynia, which circumstance gave rise to a series of letters between him and Trajan still extant. Among these are the epistles respecting the Christians, whom he directs Pliny not to search for, but only to punish if brought before him. In 104 Decebalus renewed the war with the Romans in pursuing which Trajan constructed a bridge over the Danube, below the modern Orsova, which was one of the greatest works of antiquity (105). He then marched into Dacia, reduced the capital of Decebalus and turned Dacia into a Roman province. It was in commemoration of his wars in Dacia that he erected the sculptured column which still bears his name. In 114 he dedicated the Forum that he had built in Rome and set out on a new warlike expedition against Chosroes, the Parthian. The result of this war was the reduction of Armenia to a Roman province. His war with the Parthians was completed in two campaigns, after which he sailed down the Tigris and entered the Persian Gulf. During his absence the Parthians revolted. After giving a king to the Parthians he laid siege to Atra, the capital of an Arabian tribe, but was obliged to withdraw to Syria. In the following year (117) he proposed returning into Mesopotamia, but was attacked by a disorder, which induced him to repair to Italy, leaving the army under the command of Hadrian. He had proceeded no farther than Selinus, in Cilicia, when he died, after having adopted Hadrian for his successor. His good qualities as a ruler were such that, at the distance of 250 years from his death, the senators, in their acclamations on the accession of a new emperor, were accustomed to wish that he might be more fortunate than Augustus and better than Trajan.

**TRAJAN’S COLUMN.** See ROME; TRAJAN.

**TRAJAN’S WALL,** Rumania, a fortified line in the Dobrudja extending east from the Danube to Kustendji on the Black Sea, a distance of 37 miles. It is a double, in some places, a triple, earthwork on the south side of a natural fosse consisting of a narrow marshy valley. Another wall of the same name, built by a Roman legion, 105–155 A.D., extends from the Pruth east to the Black Sea.
